# OFFICERS OF THE AMERICAN MEDICAL ASSOCIATION—1942-1943

HEADQUARTERS OF THE ASSOCIATION, 535 N. DEARBORN ST, CHICAGO

## GENERAL OFFICERS

PRESIDENT—FRED W RANKIN - - - - - Lexington, Ky  
PRESIDENT-ELECT—JAMES E PAULIN - - - - - Atlanta, Ga  
VICE PRESIDENT—WILLIAM J CARRINGTON - - - - - Atlantic City, N J  
SECRETARY AND GENERAL MANAGER—OLIN WEST - - - - - Chicago  
TREASURER—HERMAN L KRETSCHMER - - - - - Chicago  
SPEAKER, HOUSE OF DELEGATES—H H SHOULDERS - - - - - Nashville, Tenn  
VICE SPEAKER, HOUSE OF DELEGATES—R W FOUTS - - - - - Omaha  
EDITOR—MORRIS FISHBEIN - - - - - Chicago  
BUSINESS MANAGER—WILL C BRAUN - - - - - Chicago

### BOARD OF TRUSTEES

Sam E Irons, Secretary - Chicago, 1943  
Sam F Brisse - Rochester, Minn, 1943  
R I Lee, Chairman - Boston, 1944  
Henderson - Louisville, Ky, 1944  
A Fenton - Portland, Ore, 1945  
R Bloss - Huntington, W Va, 1945  
Les W Roberts - Atlanta, Ga, 1946  
F Pallette - Los Angeles, 1947  
Sensenich - South Bend, Ind, 1947

### JUDICIAL COUNCIL

H O'Shea - Spokane, Wash, 1943  
Ward R Cunniffe - New York, 1944  
Tollansbee, Chairman - Cleveland, 1945  
Er F Donaldson - Pittsburgh, 1946  
D Noland - Fairfield, Ala, 1947  
West, Secretary, ex officio - Chicago

### COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Ell L Harden - Cleveland, 1943  
Les Gordon Heyd - New York, 1944  
J Weisloffen, Secretary - Chicago, 1945  
Wilbur, Chairman - Stanford University, Calif, 1946  
H Musser - New Orleans, 1947  
E B Stone - Baltimore, 1948  
Wald Fitz - Boston, 1949

### COUNCIL ON SCIENTIFIC ASSEMBLY

Ward L Bortz - Philadelphia, 1943  
Murney Taylor - Milwaukee, 1944  
A Walker, Chairman - Birmingham, Ala, 1945  
Erick A Collier - Ann Arbor, Mich, 1946  
E L Cummer - Cleveland, 1947

### AND EX OFFICIO

President Elect, the Editor and the Secretary of the Association

### COUNCIL ON PHARMACY AND CHEMISTRY

*(Standing Committee of Board of Trustees)*  
A Hatcher - New York, 1943  
Keefer - Boston, 1943  
J Cole - Cleveland, 1943  
Rt Mudd - Philadelphia, 1943  
Howard Brown - Baltimore, 1944

James P Lerke - Washington, D C, 1944  
David P Barr - New York, 1944  
Morris Fishbein - Chicago, 1945  
G W McCoy - New Orleans, 1945  
Pearlin H Long - Baltimore, 1945  
Elmer M Nelson - Washington, D C, 1945  
Foralld Sollmann, Chairman - Cleveland, 1946  
W C Rose - Urbana, Ill, 1946  
E L Sevringhaus - Madison, Wis, 1946  
E M K Geiling - Chicago, 1947  
W W Palmer - New York, 1947  
S W Clausen - Rochester, N Y, 1947  
Austin E Smith, Acting Secretary - Chicago

### COUNCIL ON PHYSICAL THERAPY

*(Standing Committee of Board of Trustees)*

W E Garrey - Nashville, Tenn, 1943  
W W Cohlentz - Washington D C, 1943  
John S Coulter, Chairman - Chicago, 1943  
Eben J Carey - Milwaukee, 1944  
Frank R Ober - Boston, 1944  
Frank D Diel son - Kansas City, Mo, 1944  
A U Desjardins - Rochester, Minn, 1945  
H B Williams - New York, 1945  
Frank H Krusen - Rochester, Minn, 1945  
Anthony C Cipollaro - New York, 1946  
M A Bowie - Bryn Mawr, Pa, 1946  
George M Piersol - Philadelphia, 1946  
Morris Fishbein, ex officio - Chicago  
Howard A Carter, Secretary - Chicago

### COUNCIL ON FOODS AND NUTRITION

*(Standing Committee of Board of Trustees)*

Lydia J Roberts - Chicago, 1943  
George R Cowgill - New Haven, Conn, 1943  
C S Ladd - Washington, D C, 1944  
Tom D Spies - Cincinnati, 1944  
Irvine McQuarrie - Minneapolis, 1945  
Morris Fishbein - Chicago, 1945  
R M Wilder - Rochester, Minn, 1946  
Howard B Lewis - Ann Arbor, Mich, 1946  
J S McLester, Chairman - Birmingham, Ala, 1946  
Philip C Jeans - Iowa City, 1947  
C A Elvehjem - Madison, Wis, 1947  
Franklin C Bing, Secretary - Chicago

### COUNCIL ON INDUSTRIAL HEALTH

*(Standing Committee of Board of Trustees)*

L D Bristol - New York, 1943  
Stanley J Seeger, Chairman - Texarkana, Texas, 1943  
Philip Drinker - Boston, 1943  
W D Stroud - Philadelphia, 1943  
Harvey Bartle - Philadelphia, 1944  
Leroy U Gardner - Saranac Lake, N Y, 1944  
A J Lanza - New York, 1944  
Robert T Legge - Berkeley, Calif, 1944  
Warren F Draper - Washington, D C, 1947  
Henry H Kessler - Newark, N J, 1947  
C D Selby - Detroit, 1947  
Raymond Hussey - Baltimore, 1947  
C M Peterson, Secretary - Chicago

### COMMITTEE ON SCIENTIFIC EXHIBIT

Roger I Lee, Chairman - Boston  
E L Henderson - Louisville, Ky  
Ralph A Fenton - Portland, Ore  
Thomas G Hull, Director - Chicago

### ADVISORY COMMITTEE

D Chester Brown - Danbury, Conn  
George Blumer - New Haven, Conn  
Paul J Hanzlik - San Francisco  
Ludvig Hektoen - Chicago  
Urban Maes - New Orleans  
Eben J Carey - Milwaukee  
James P Lerke - Washington D C

### BUREAU OF LEGAL MEDICINE AND LEGISLATION

J W Holloway Jr, Director - Chicago

### BUREAU OF HEALTH EDUCATION

W W Bauer, Director - Chicago

### BUREAU OF INVESTIGATION

Paul C Barton, Director - Chicago

### BUREAU OF MEDICAL ECONOMICS

R G Leland, Director - Chicago

### LABORATORY

Albert E Sidwell Jr, Director - Chicago

### LIBRARY

Marjorie Hutchins Moore Librarian - Chicago

## SECTION OFFICERS

PRACTICE OF MEDICINE—Chairman, Burrell O Raulston, Los Angeles, Vice Chairman, Charles C Wolferth Philadelphia, Secretary, D Stroud, 1011 Clinton Street, Philadelphia

URGENT, GENERAL AND ABDOMINAL—Chairman, Frederick Collier, Ann Arbor, Mich, Vice Chairman, Lester R Dragstedt, ago, Secretary, Alton Ochsner, 1430 Tulane Avenue, New Orleans  
OBSTETRICS AND GYNECOLOGY—Chairman, Louis E Phineuf, on, Vice Chairman, Wendell M Long Oklahoma City, Secretary, ip F Williams, 2206 Locust Street, Philadelphia

OPHTHALMOLOGY—Chairman, Conrad Berens, New York, Vice rman, Robert von der Heydt, Chicago, Secretary, Donald J Lyle, 441 e Street, Cincinnati

ENTOMOLOGY, OTOLOGY AND RHINOLOGY—Chairman, de C Cody, Houston Texas, Vice Chairman, William H Johnston, ta Barbara, Calif, Secretary, Louis H Clerf, 1530 Locust Street, Philadelphia

PEDIATRICS—Chairman, Hugh L Dwyer, Kansas City, Mo, Vice rman, Francis S Smyth San Francisco, Secretary, Gilbert J Lyle, South Bellevue Boulevard Memphis, Tenn

EXPERIMENTAL MEDICINE AND THERAPEUTICS—Chairman, ley R Harrison, Winston Salem, N C, Vice Chairman, E V Rochester, Minn, Secretary, Dwight L Wilbur, 490 Post Street, rancisco

PHYSIOLOGY—Chairman, Frank C Mann, Vice Chairman Virgil H Moon, Philadelphia, Secre , 55 East Washington Street, Chicago

NERVOUS AND MENTAL DISEASES—Chairman, J M Nielsen, Los Angeles, Vice Chairman, Theodore A Watters, New Orleans, Secretary, R P Mackay, 8 South Michigan Boulevard, Chicago

DERMATOLOGY AND SYPHILOLOGY—Chairman, Clark W Fin nerud, Chicago, Vice Chairman, Frank J Eichenlaub, Washington, D C, Secretary, Nelson Paul Anderson, 2007 Wilshire Boulevard, Los Angeles

PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH—Chairman, Joseph W Mountin, Washington, D C, Vice Chairman, E L Stebbins, New York, Secretary, W A Sawyer, 343 State Street, Rochester, N Y

UROLOGY—Chairman, Gershom J Thompson, Rochester, Minn, Vice Chairman, Arbor D Munger, Lincoln, Neb, Secretary, Grayson L Carroll 539 North Grand Boulevard, St Louis

ORTHOPEDIC SURGERY—Chairman Guy A Caldwell, New Orleans, Vice Chairman, Theodore A Willis, Cleveland, Secretary, Francis M McKeever, 1136 West Sixth Street, Los Angeles

GASTROENTEROLOGY AND PROCTOLOGY—Chairman Emmett H Terrell, Richmond, Va, Vice Chairman, J Arnold Bargen, Rochester, Minn, Secretary, Sara M Jordan, 605 Commonwealth Avenue Boston

RADIOLOGY—Chairman, Robert A Arens Chicago, Vice Chairman, Edwin C Ernst, St Louis, Secretary, John T Murphy, 421 Michigan Street, Toledo Ohio

ANESTHESIOLOGY—Chairman, Paul M Wood, New York, Vice Chairman, William W Hutchinson, Los Angeles, Secretary, John S Lundy, 102 Second Avenue S W, Rochester, Minn

## THE APPROXIMATE VITAMIN REQUIREMENTS OF HUMAN BEINGS

ROGER T. WILLIAMS, PH.D., D.Sc.

Professor of Chemistry and Director, Biochemical Institute  
University of Texas  
AUSTIN, TEXAS

Most of the research on vitamins and nutrition is directed ultimately to the solution of problems of human nutrition. In a war situation such as ours it is particularly desirable that we be able to apply whatever we may know or learn to practical ends.

A fully adequate idea of the requirements of human beings for the various vitamins could presumably be obtained only as a result of a series of extended controlled studies using human subjects. Even if it were feasible to plan and carry out experiments of this type just as animal experiments are planned and carried out, individual differences, assuming that small numbers of subjects were used, would doubtless make the results very irregular.

Recently we have developed assay methods for a number of the B vitamins<sup>1</sup> and because of an increased accumulation of information from various sources it becomes possible to state more definitely the vitamin contents of various foods and tissues. It appears now that this information makes it possible to obtain very simply a considerable amount of desired information regarding probable human requirements.

A study of the vitamin contents of (1) a well rounded mixed diet which might be recommended for human beings and (2) a widely used commercial animal food which promotes excellent performance in omnivorous animals shows that these more or less ideal diets when compared on an isocaloric basis, contain a relatively constant amount of the various B vitamins. This comparison is made more striking when the carcass of a mammal (rat) is also compared. Again, on the same caloric basis, the content of B vitamins agrees approximately and never is there disagreement by more than a factor of two. Where there is good agreement between these three independent materials there is a strong presumption that the amounts associated with 2,500 calories represent the approximate human requirement, assuming of course that the substance in question is actually a vitamin for human beings and cannot be synthesized in the body.

The indicated well rounded simplified diet, made up of natural foods, was formulated on the basis of modern

nutritional knowledge but without regard to its content of B vitamins. Presumably any one of a number of other mixed diets would yield results similar in this regard. It is doubtful if any diet could be selected which *a priori* would be known to be superior to the one chosen. It contains "protective foods" but not in obvious excess and is sufficiently diversified so that every nutrient should be amply provided. Enough milk and orange juice were included to insure good supplies of calcium and ascorbic acid respectively, but other considerations regarding specific needs were disregarded. The diet as indicated was completely settled on before any calculations regarding its content of B vitamins were made.

No claim can be made that the assay values are without error or that the total values derived from their consideration are in any sense final. Individual samples of foodstuffs vary in their content of B vitamin, but since the diet is made up of a number of constituents and often a number of samples were averaged, these variations doubtless tend to cancel out. There is no reason to think that the values obtained for any of the vitamins are consistently high. If enzymatic extraction is incomplete in any case, the values, of course, would tend to be low.

The animal food chosen (two samples obtained at different times of year) was a widely used commercial article suitable for rats, mice, dogs, cats and monkeys and which yields most excellent results, at least with the commoner laboratory animals. It is a mixed meat, milk and cereal diet containing various special additions including yeast and vitamin concentrates. Because the diet is the result of a large amount of research and yields excellent results, its general adequacy cannot be questioned. There are economic reasons why it would not be expected to contain the vitamins in excess. Concentrates and special additions are expensive and would naturally be used only on the basis of proved value.

An inspection of table 2 indicates that the following probably represent perfectly "safe" levels for daily intake of B vitamins by human beings, even under conditions of pregnancy and lactation: thiamine 3.2 mg, nicotinic acid 40 mg, riboflavin 3.7 mg, pantothenic acid 11 mg, biotin 0.14 mg, inositol 1,000 mg, pyridoxine 1.5 mg and folic acid 10 mg unit. It is not certain, of course, that all the B vitamins in the last four substances are actually required by human beings. Regardless of this fact, the vitamins actually occur in foods to about the extent indicated.

The National Research Council Committee on Foods and Nutrition has recently given careful study to the vitamin requirements of human beings. On the basis of available information the thiamine requirement, on a 2,500 caloric basis, has been estimated at 1.5 mg daily. During pregnancy and lactation this is raised

I have received valuable assistance from my colleagues. The Williams-Waterman Fund of Research Corporation made a special grant and the Clayton Foundation of Houston, Texas furnished the support which has made our testing program possible.  
<sup>1</sup> Studies on the Vitamin Content of Tissues. I. University of Texas Publication 4137, 1941.

figured on the same calory basis) to 18 mg and 9 mg respectively. The lowest figure is about the content of cow's milk and is higher than the content of human milk and therefore may be high enough. However, on the basis of the figures given in table 2, one might conclude that the values given are too low for absolute safety. Considering the whole rat carcass as a "complete" food, its thiamine content appears low in comparison until the low carbohydrate content is considered.

The National Research Council Committee has estimated the nicotinic acid requirement of man as 15 to 25 mg a day (2,500 calories). Elvehjem has placed it at 25 mg a day. The two diets furnish an adequate supply even on the latter basis. The higher content of the rat carcass may be correlated with the rat's ability to synthesize nicotinic acid.

The human riboflavin requirement has been estimated at 2.2 to 2.5 mg daily (2,500 calories). According to the figures given in table 2 one would conclude that

TABLE 1—Vitamin B Content of Foods

| Constituent         | Per Cent of the Calories | Thiamine, Mg | Nicotinic Acid, Mg | Riboflavin, Mg | Pantothenic Acid, Mg | Biotin, Mg | Inositol, Mg | Pyridoxine, Mg | Folic Acid, Mg Unit |
|---------------------|--------------------------|--------------|--------------------|----------------|----------------------|------------|--------------|----------------|---------------------|
| Whole milk          | 20                       | 0.3          | 0.4                | 1.4            | 2.2                  | 0.06       | 100          | 0.20           | 0.100               |
| Whole wheat cereals | 30                       | 1.0          | 11.5               | 0.34           | 2.4                  | 0.01       | 350          | 0.44           | 0.166               |
| Beef                | 9                        | 0.07         | 10.0               | 0.4            | 1.0                  | 0.01       | 21           | 0.11           | 0.043               |
| Pork                | 9                        | 1.5          | 7.0                | 0.2            | 0.7                  | 0.01       | 8            | 0.11           | 0.025               |

| Potatoes            | 10                       | 0.2          | 3.6                | *              | 1.0                  | 0.002      | 87           | 0.66           | 0.190               |
| Butter              | 5                        | *            | *                  | *              | *                    | *          | *            | *              | *                   |
| Eggs                | 6                        | 0.2          | *                  | 0.04           | 0.2                  | 0.002      | 1            | *              | *                   |
| Fresh peas          | 4                        | 0.15         | 2.0                | 0.14           | 0.7                  | 0.014      | 16.2         | 0.63           | 0.124               |
| Fresh carrots       | 4                        | 0.1          | 0.6                | 0.15           | 0.6                  | 0.012      | 235          | 0.16           | 0.285               |
| Orange juice        | 2                        | *            | *                  | *              | *                    | *          | *            | *              | *                   |
| Total               | 100                      | 3.6          | 40.1               | 3.67           | 11.2                 | 0.25       | 987          | 1.77           | 1.70                |

\* The amount of these foods is small enough so that they contribute negligible amount of the B vitamin in question to the diet.

For perfect safety this figure should be increased by about 60 per cent.

No one has, so far as I know, ventured an estimate of the human requirement of pantothenic acid, but it appears safe now to conclude that it cannot be far from 10 mg a day. The validity of this estimate is increased by the fact that cow's milk yielded 10.5 mg per 2,500 calories, and human milk 10.9 mg per 2,500 calories.

The pyridoxine requirement, following the same line of reasoning, appears to be about 1.5 mg a day, that of "folic acid" (assuming it to be required) about 1 mg a day, and that of biotin about 0.15 mg a day.

Inositol is predominantly from vegetable sources, as shown in table 1, and the amount associated with 2,500 calories of food varies tremendously, depending on the source. A good mixed diet yields 1 Gm a day or more.

Assays of various organisms from different portions of the biologic kingdom (mammals, insects, bacteria, yeasts, higher plants) indicate that all eight of the B vitamins considered are always present. They appear, particularly in the case of thiamine, nicotinic acid, riboflavin and pantothenic acid, a definite tendency toward parallelism in the content of whole organisms. Yeasts, for example, are five to ten times as rich as the mixed diet in each of these four vitamins. Insects (cockroaches and termites), on the other hand, are in every case two to four times as rich in these vitamins

as the mixed diet. The other B vitamins tend to be more evenly distributed in the lower and higher forms of life. It thus appears that the tentative human requirements mentioned are parallel to but much lower than the amounts (figured on an isocaloric basis) which insect eating birds or yeast eating insects obtain.

TABLE 2—Vitamin B Content of Various Materials (2,500 Calories)

|             | Thiamine, Mg | Nicotinic Acid, Mg | Riboflavin, Mg | Pantothenic Acid, Mg | Biotin, Mg | Inositol, Mg | Pyridoxine, Mg | Folic Acid, Mg Unit |
|-------------|--------------|--------------------|----------------|----------------------|------------|--------------|----------------|---------------------|
| Mixed diet  | 3.6          | 40.1               | 3.67           | 11.2                 | 0.25       | 987          | 1.77           | 1.70                |
| Dog food    | 2.8-4.4      | 40-24              | 7-6.2          | 10-10.0              | 0.114-0.14 | 1,170-2,909  | 1.86-1.13      | 0.66-0.94           |
| Rat carcass | 1.86         | 63.0               | 4.03           | 14.0                 | 0.124      | 217          | 0.93           | 1.56                |

It is obvious that for various reasons (economic inability, use of decorticated grains, losses in cooking and cooking water, use of refined sugar and other "refined" foods) most people do not get as much of the various B vitamins as they probably should have.

What can be done to supplement this lack? One of the means which has been introduced by some members of the medical profession is the prescription of vitamin B complex preparations, which are usually derived from yeast or liver and often fortified with those synthetic vitamins which are available.

Unfortunately while yeast and liver are rich sources of B vitamins both known and unknown, they do not necessarily yield extracts which are extraordinarily rich. The B vitamins occur in bound form and are freed only by some type of digestion (autolysis or otherwise). When digestion is used to free the vitamins, much other soluble material is formed which contaminates the extract. One commercial brewers' yeast extract (from autolyzed yeast) was assayed for the eight B vitamins considered and found to be a good source of each. A calculation showed however that, in order to get enough of the B vitamins to equal the intake on a good diet one would have to consume

TABLE 3—Constituents of Average Daily Adult Dose of "Vitamin B Complex" as Sold by Six Representative Drug Houses

|   | Thiamine, Mg | Riboflavin, Mg | Nicotinic Acid, Mg | Pantothenic Acid, Mg | Pyridoxine, Mg |
|---|--------------|----------------|--------------------|----------------------|----------------|
| 1   | 2.5          | 0.62           | 5.0                | 0.9                  | 0.330          |
| 2   | 1.0          | 1.0            | 0.15               | 0.225                | 0.05           |
| 3   | 3.0          | 2.0            | 20.0               | 1.0                  | 1.0            |

10 per cent of one's calories in the form of this yeast extract (7 to 8 teaspoons of dry powder). In a preparation such as this the physician could hardly expect to find a therapeutic agent of pronounced value. Extracts or preparations which are worthy of consideration should be plainly labeled as to their content of the various B vitamins and enough should be present to allow significant dosage. For correction of a deficiency

it may be desirable in some cases to give several times the ordinary daily intake

A survey of a number of representative vitamin B complex preparations with regard to their content of B vitamins is summarized in table 3. It is apparent that these preparations are in general wholly inadequate as sources of the vitamin B complex. Several of them may be of value because of their fortification with thiamine, nicotinic acid or riboflavin but they fail to contain anything like balanced amounts of the various B vitamins.

My purpose in this article is to point out that the approximate human requirements for various of the B vitamins can now be estimated with some reliability. Many American diets are doubtless low in these essential substances. Attempts to correct these deficiencies must be made intelligently and with full knowledge of what the requirements are and the contents of the proposed remedial agents. The present economic waste involved in the production and sale of preparations of questionable value must be large.

## THE ABSORPTION OF VITAMIN A IN TUBERCULOSIS

B. B. BRESE, JR., M.D.

EVELYN WATKINS, M.D.

AND

AUGUSTA B. MCCOORD, PH.D.

ROCHESTER, N. Y.

In studies on man relating to vitamin A, reduced ability to absorb the vitamin was found in 1 patient with old intestinal tuberculosis. This suggested that investigation of patients with intestinal symptoms associated with tuberculosis should be made by means of the vitamin A absorption test.

This vitamin A absorption test is somewhat similar to the dextrose tolerance test. The patient is given a known amount of vitamin A in the form of a concentrated fish liver oil by mouth (7000 U. S. P. units per kilogram of body weight). Blood samples are taken before the oil is given and at four, eight and twenty-four hours after the ingestion of the oil. These blood samples are then analyzed chemically for the vitamin A concentration.<sup>1</sup>

Normally there is a decided rise in the blood concentration of vitamin A which usually reaches a peak at the fourth hour. Since vitamin A is fat soluble this test probably gives an index of the absorption of other fat soluble vitamins as well as fat itself. It has been shown that in several diseases in which fat digestion is disturbed the absorption of vitamin A is poor and the vitamin A absorption curve obtained is "flat." Thus in celiac disease,<sup>2</sup> cystic fibrosis of the pancreas,<sup>3</sup> intes-

tinal obstruction,<sup>4</sup> catarrhal jaundice and other hepatic diseases<sup>5</sup> the vitamin A absorption is abnormal.

The utilization of fat soluble vitamins and the fats themselves is obviously important in tuberculosis. Accordingly 29 patients with active pulmonary tuberculosis and intestinal symptoms were selected for preliminary study. Most of the patients had moderately to far advanced pulmonary tuberculosis and at least some intestinal symptoms.

These patients were divided into two groups: 16 patients with mild or slight intestinal symptoms and 13 patients with moderate to severe intestinal symptoms. On a basis of clinical symptoms (cramps, diarrhea and pain) most of the latter group would be classified as having intestinal tuberculosis. However, 7 of these patients subsequently died and came to autopsy. In only 2 of these 7 were significant pathologic changes found in the intestinal wall and these changes were found as is usual in the large bowel. Because of the difficulty of judging the degree of tuberculous intestinal involvement clinically, and because the patients' condition did not warrant extensive studies, we have divided our patients on this symptomatic rather than a pathologic basis.

No patient had an elevation of temperature at the time of the test.

As controls we used twenty-seven vitamin A absorption tests done on 25 supposedly normal adults.

### RESULTS

The results of the tests are recorded in the accompanying table. It will be noted that the mean maximum rise in vitamin A in the blood of normal persons was approximately twice that of all patients with tuberculosis. Furthermore, the blood of tuberculous patients with mild intestinal symptoms reached, on the average, twice the level of those with moderate or severe symptoms. Although there was considerable variation in individual cases, differences in the means are statistically significant. The maximum rise in concentration of vitamin A occurred at the fourth hour in 72 per cent of the patients with tuberculosis and in 70 per cent of the normal subjects. In the remaining subjects the maximum level was reached at eight hours.

If the degree of weight loss (weight at the time of test compared with standard weight for age and height) is correlated with the ability to absorb vitamin A, one finds that there is a moderate correlation (correlation coefficient is  $0.528 \pm 0.10$  using method of rank-difference correlation). In other words, the more underweight on the average, that the tuberculous patient is, the less able he seems to absorb vitamin A well.

### COMMENT

Our studies do not indicate the reason for lessened absorption of vitamin A in severely sick patients with tuberculosis. Fever, however, played little or no part, since most of the patients were afebrile at the time of the test. Actual tuberculous disease of the intestine, liver or pancreas probably was not a factor, for in the majority of patients who came to autopsy (all except 1 of whom absorbed vitamin A poorly) no gross or microscopic lesions were found in these organs which one would expect to interfere with the function of fat absorption. What functional derangement of absorption occurs, therefore, can only be surmised. In this

Dr. Carl Nielson of the Abbott Laboratories supplied us with the fish liver oil used in these tests.

From the Department of Pediatrics of the University of Rochester School of Medicine and Dentistry and Iola Sanatorium.

Mr. Arthur Kornberg and Miss Lolita Pannell performed the vitamin A absorption tests on 20 of the normal controls used in this study. These tests were done in the Department of Medicine of the University of Rochester School of Medicine and Dentistry.

1. The methods for the determination of vitamin A and of carotene and xanthophyll are given in detail elsewhere (Dann, W. J., and Evelyn, K. A. Method for Vitamin A Determination. *Biochem. J.* **32**: 1009 [June] 1938; Clausen, S. W., and McCoord, Augusta B. Method for Carotene and Xanthophyll. *J. Biol. Chem.* **113**: 89 [Feb.] 1936).

5. Brese, B. B., and McCoord, Augusta B. *J. Pediat.* **16**: 139 (Feb.) 1940.

connection the recent report of Sheely<sup>6</sup> on prothrombin efficiency in pulmonary tuberculosis is of interest. He showed in a series of 106 cases of tuberculosis that significant deficiency of prothrombin occurred in 51. In general, the more severe the tuberculosis, the more frequent was this deficiency. He felt that the toxemia resulting from the tuberculosis was related to the prothrombin concentration. Since vitamin K is, like vitamin A, fat soluble, this deficiency may result from poor absorption of vitamin K. Thus those factors in tuberculosis which cause poor absorption of vitamin A may also cause poor absorption of vitamin K.

Practically, however, there is some direct experimental basis for the clinical practice of giving large amounts of fat-soluble vitamins to patients with tuberculosis. In order to give adequate amounts of these vital substances to these patients more than the normal requirement should be given, especially if the patient has intestinal symptoms or noticeable loss of weight.

SUMMARY

The absorption of vitamin A by 29 patients with severe pulmonary tuberculosis and variable degrees of intestinal symptoms was tested by means of the "vitamin A absorption test." The absorption of vitamin A by these patients was poorer than that by normal persons. Furthermore, the greater the degree of weight loss and the more severe the intestinal symptoms, the poorer, on the average, was their ability to absorb vitamin A. The explanation of this was not found at autopsy.

These facts give some experimental basis for the clinical teaching that the vitamin content of the diet of the patient with tuberculosis should be above the average requirement.

**The Linkage of Cause and Effect**—If the gulf seems wide between the scientific method in science and the scientific method applied to social problems, we can be sure that time and rational effort will narrow it. Public health is now not a matter of prayer but of swift action. The public is educated to the need for control of epidemics because cause and effect have become scientifically linked on the level of public understanding. If tariffs, social security measures and unemployment were also educable to similar linkages of simply expressed cause and effect we might have a safer and happier future. In some complex problems, however, the linkage of cause and effect is not simple. It is hard to find proposition number one. Instead of one cause for unemployment there are a half dozen at least—Bowman, Isaiah. Enduring Purpose, *Assn. Am. Coll. Bull.* 6: 194 (May) 1940.

HISTAMINE IN THE TREATMENT OF MÉNIÈRE'S SYNDROME

AN APPRAISAL

MILES ATKINSON, M.D., F.R.C.S. (ENG.)

NEW YORK

The publication in 1940 by Shelden and Horton<sup>1</sup> from the Mayo Clinic of a paper on the successful treatment of Menière's syndrome with histamine naturally caused a stir in the medical world. When to the value which is always attached to work from that institution was added the dramatic movie demonstration, at the annual meeting of the American Medical Association in the same year, of several acutely dizzy patients who, given an intravenous injection of histamine, immediately rose from their beds and walked, the reputation of histamine for the treatment of this condition was obviously assured, at least for a time. Since then it has been widely used and widely discussed.

Yet even at that time there were grounds for doubt as to whether histamine was really the wonder worker that it seemed to be. These doubts were voiced in a paper<sup>2</sup> which, written at that time (July 1940) and containing the results of some clinical experiments conducted during the previous twelve months on patients with Menière's syndrome, was later published in *THE JOURNAL*. In the year which has followed that writing, experience has accumulated which seems to prove those doubts to have been well founded, and it is to this experience and to some confusion evident in the minds of colleagues that the present communication is due.

Shelden and Horton advocated the use of histamine in all cases of Menière's syndrome without exception and claimed immediately satisfactory results in a large proportion of cases. These results, however, have not always been maintained even for patients who faithfully followed the maintenance regimen laid down by the authors. What proportion of cases has relapsed is not known, but that some have is shown by the fact that I have personal experience of 4 and reliable knowledge of 4 more. Moreover, results with histamine administered by a somewhat different method to patients of the histamine insensitive group have, as will be seen, been far from satisfactory.

In the paper mentioned,<sup>2</sup> reasons were given for believing that cases of Menière's syndrome did not all own the same etiology, but that they could be divided into two groups distinguishable by an intradermal test for histamine sensitivity, which was described. Further experience has only gone to confirm this finding. Unfortunately, to judge by inquiries received, this principle does not seem always to have been understood. So firmly has histamine become incorporated in the mind of the profession with Menière's syndrome that it is still being used in cases for which, if the thesis of two groups is correct, it is not suitable. My purpose in this paper is to show reason why it is believed that the use of histamine for all cases indiscriminately is unwise.

THE TWO GROUPS OF MÉNIÈRE CASES

To recapitulate briefly the principle mentioned, there is one group, and that the smaller one comprising less than a fourth of all cases, which is histamine sensitive.

From the Department of Surgery (Otolaryngology), the New York Hospital, and Cornell University Medical College.  
1 Shelden, C. H., and Horton, B. T. Treatment of Menière's Disease with Histamine Administered Intravenously, *Proc. Staff Meet., Mayo Clin.* 15: 17 (Jan. 10) 1940.  
2 Atkinson, Miles. Observations on the Etiology and Treatment of Menière's Syndrome, *J. A. M. A.* 116: 1753-1760 (April 19) 1941.

to the cutaneous test. As was shown in the original paper, this group can be treated effectively by gradual desensitization to histamine. Further experience has not altered this opinion though it has been found that sometimes a second and even a third short course may be necessary just as it may be necessary to repeat a vaccine. But it must be insisted that if success is to be achieved the criteria laid down for the intradermal test must be rigidly adhered to. To judge an intradermal test with histamine by the criteria for an intradermal test with ordinary allergens is to fall into error, for histamine is an irritant substance and produces even in normal subjects a considerable reaction. As in all departments of medicine a knowledge of the normal is necessary here in order to assess the abnormal. Experience has shown that dermal reactions which are normal are commonly read as abnormal or positive by those without previous experience of the test. But given that the patient shows a true positive cutaneous reaction to histamine the results of desensitization are eminently satisfactory.

The second and much the larger group which shows a normal cutaneous reaction to histamine cannot be treated satisfactorily by histamine at all, except over a short period of time virtually the time of the acute attack. The reason for this is that the attack in the larger group of patients the group insensitive to histamine is due to a vasoconstrictor mechanism. The evidence for this statement also is given in the original paper. Now if vasospasm is accepted as the underlying mechanism of the attack in this the larger group it is easy to understand why histamine acts in the acute phase as Shelden and Horton have shown that it does. Histamine is well

known as a powerful peripheral vasodilator, and because of this effect it overcomes the vasospasm producing the attack and so relieves the patient. But any peripheral vasodilator will do the same thing. I have recorded cases in which acute attacks have been relieved by amyl nitrite and acetylcholine, as also the satisfactory results obtained by using nicotinic acid over prolonged periods in the treatment of this group. Since the publication of that paper, acute attacks in 2 other cases have been immediately relieved, on two occasions by the intravenous use of sodium nitrite (0.1 Gm.) and on one occasion with nicotinic acid 50 mg. given intravenously, that is to say, by two other vasodilator drugs. It would thus seem probable that histamine by intravenous drip as recommended by Shelden and Horton, acts not by reason of any virtue in itself qua histamine but only by virtue of its action as a vasodilator.

If the objection to histamine were only that it has no specific action other than its vasodilator effect, it would be a small matter. It might serve its turn here, as does ergotamine in migraine headache by relieving the acute attack even though it has no effect in preventing a recurrence. But there is more to it than that. Histamine repeated at regular intervals as a maintenance dose in this group of cases may and often does produce or at least is followed by, an increased frequency and

severity of attacks and sometimes an increase of deafness which can be shown objectively in an audiogram (as illustrated). One patient (V K, 15) said that she had the three most severe attacks in her experience while under treatment with histamine by the rapid method which Horton recommends.

#### RESULT OF HISTAMINE TREATMENT IN THE VASOCONSTRICTOR GROUP

The satisfactory results of histamine treatment in the vasodilator group have already been mentioned.<sup>2</sup> Details have been given in the original paper. In the vasoconstrictor group 15 persons were treated with histamine, 11 by me and 4 elsewhere who have since come under my care. Two of these were treated at the Mayo Clinic, the third in another clinic strictly according to detailed instructions from Dr. Horton and the fourth according to the Horton method as published.

The 11 personal cases came to be treated with histamine in the early days of working out the histamine cutaneous test, when positives were eagerly looked for and doubtful appearances were enthusiastically read as positive which it was later learned should have been

Audiograms in case 11 (histamine insensitive vasoconstrictor). Solid line before treatment line of dots and dashes after treatment with histamine dotted line restoration with nicotinic acid

read as negative. In consequence these wrongly grouped cases were treated with histamine, but by the slow desensitization process that I described, not in the manner described by Shelden and Horton. Actually in the two the principle is the same, though the details differ.

Of the 11 misgrouped cases treated according to the method I described, 2 improved slowly throughout the course until at the end they were free from even minor spells of vertigo. Since then they have been given only nicotinic acid and have remained well. Seven showed immediate improvement for a time (vasodilator action) and then relapsed, 1 after one injection, 4 after two or three injections, 2 after several injections, while 1 patient who relapsed experienced attacks of vertigo of increased frequency and severity. Two were immediately and progressively worse and treatment had to be stopped. In 4 cases tinnitus increased and the audiogram dropped sharply, in 1 quite precipitously and it was many months before hearing again returned to its previous level (shown in the audiograms). In the other 7 cases deafness and tinnitus were unaffected.

Of the 4 patients treated elsewhere, 1 experienced temporary results—or coincidental remission of attacks—then no relief. Two others experienced no remission, in fact attacks increased somewhat in severity without noticeable change in hearing or tinnitus, the

with similarly experienced no remission, but instead increase not only in vertigo but in deafness and tinnitus as well. In contrast to these unsatisfactory results of treatment with histamine in the vasoconstrictor group are the results of treatment with nicotinic acid. All the 15 patients in this series have been subsequently treated with nicotinic acid with the exception of 3: patient 8, who has been lost, patient 10, who improved for a time on nicotinic acid after histamine had made him worse, and patient 15, who has relapsed and has been lost sight of, and patient 15 who has only just come under observation. Two had already been relieved of attacks by histamine and have remained well since on nicotinic acid as already stated (patients 1 and 2). The remaining 10 have all been relieved of attacks over periods varying from three to fifteen months, except patient 12, severely ill, who at the time was having attack after attack. She was rapidly relieved by nicotinic acid, but when a reduction in dose was attempted (in August 1941) she relapsed in three weeks and started to have daily attacks again. Stepping up the dose of nicotinic acid promptly stopped them (illustrative case 1).

Results of Treatment with Histamine in Fifteen Cases of Vasoconstrictor Type

| Patient  | Sex | Age | Method | Vertigo                             | Deafness | Tinnitus | Result with Histamine                      | Result with Nicotinic Acid |

Method: Slow, author's; rapid, Horton's. N C, no change.

In addition as control and as further evidence of the effectiveness of nicotinic acid in the treatment of this group, it may be mentioned that, since the original report in which the results of this method in 17 cases were given,<sup>2</sup> a further 79 cases have been seen and treated on the same lines. A detailed report on results will be made shortly. Here it must be sufficient to say that they have been as satisfactory as in the case of the original 17 and have served amply to confirm the previous findings.

COMMENT

Referring only to that group of cases which has been called vasoconstrictor, it is apparent that histamine produces in many cases immediately beneficial results, especially in the treatment of the acute attack, and this is explainable by its vasodilator action. It would seem, however, that in the long run the results are not so satisfactory. This also is understandable. Repeated administration of the drug appears to induce in the body an immunity to its action, perhaps by encouraging

an increased production of histamine esterase, so that ultimately histamine loses its dilator effect. This is the rationale of desensitization in the sensitive group. If, and this is surmise, histamine is in part responsible for the normal balance of vasodilatation-vasoconstriction, if, as may be the case, excess of histamine or a histamine-like substance is the cause of the vasodilator effects seen in allergic subjects, then it stands to reason that neutralization of the vasodilator effect of histamine by increasing resistance to it, while perfectly rational in those cases in which vasodilatation is excessive, is quite irrational in that large majority of patients who are the victims of a primary vasoconstrictor mechanism. In them the normal compensatory process of vasodilatation is already diminished or absent, and the exhibition of histamine once its initial vasodilator effect has passed, will only serve to diminish further an already inadequate process. Indeed, it has been observed in several instances that the response to a vasodilator (nicotinic acid) is slower and for a time less satisfactory than usual in vasoconstrictor cases which have been previously treated with histamine. They become resistant and require higher dosage.

This objection, of producing resistance to the drug, does not apply to nicotinic acid. The body does not appear to acquire an immunity to the vasodilator action of this substance. Nor, since nicotinic acid is a naturally occurring substance, a vitamin, would acquisition of immunity be expected. In practice it has been found that this substance can be given over long periods of time with steady improvement, and often very rapid improvement, as regards diminution in severity of attacks, and with ultimate cessation of them.<sup>2</sup> Indeed, the results are sometimes little short of miraculous. Nicotinic acid may not be the final answer in the treatment of this group, but it is by far the best that I have found as yet.

SUMMARY

It seems not unjust to conclude from the evidence given that histamine is not suitable for universal application in cases of Meniere's syndrome. It is suitable for selected cases only, and only by assigning individual cases to their correct group can effective treatment be assured. It is on a par with typing pneumonia cases for serum treatment. Confusion has crept in—my mail is ample evidence of it and the precipitating cause for this communication—because histamine has two effects, an immediate and a remote, and the two have not been distinguished. The immediate effect is vasodilator, in

3 Since this paper was written, patient 15 has gone steadily ahead on nicotinic acid therapy, needing rather large doses, and has now been free from attacks for three months. Patient 14 on the other hand has relapsed after three months of freedom, perhaps as a result of the excessive doses which he as a doctor gave himself. This effect has been seen on other occasions. He was, unfortunately, impatient of relief and rather than try the effect of reduction, elected to have an eighth nerve section.

consequence of which it often gives immediate and sometimes dramatic relief from a vasoconstrictor attack though no more immediate or dramatic than other peripheral vasodilators. Its remote effect by inducing a resistance to its action in the body in the same way in which a vaccine produces a resistance to the effects of a micro-organism is nil or actually even vasoconstrictor. For this reason its repeated administration while exceedingly effective in the vasodilator group as a desensitizing agent in vasoconstrictor cases not only fails after the initial doses to produce the desired effect but sometimes even makes matters worse. Histamine will not relieve all or even most cases of Meniere's syndrome. Preliminary accurate grouping is essential to success.

#### ILLUSTRATIVE CASES

The following are three illustrative cases.

**CASE 12—***An instance in which histamine failed and nicotine acid succeeded.*

A woman aged 32 had suffered from Meniere attacks of increasing frequency and severity off and on over a period of eleven years. She had tried all the recognized methods of treatment and some others when she heard of histamine. She was treated with this substance at the Mayo Clinic therefore correctly and adequately according to its approved method with coincident improvement but with relapse following immediately on cessation of intensive treatment. Nevertheless she continued conscientiously with the maintenance regimen as advised, which however did not improve matters. When seen in April 1941 she was having three to four minor attacks daily and two or three severe attacks every week. She was almost completely incapacitated. Vigorous treatment with nicotine acid resulted in decided improvement within a week, and she was free from dizziness of any sort for three months (August 1941). Though still not entirely herself again a letter said that she was more active than she had been 'for a very long time' and was improving. Dosage was consequently decreased and in early September she wrote to say that she was experiencing another spell of attacks. Nicotinic acid intravenously stopped them at once, and on continued oral dosage she has been free for six weeks (October 1941).

**CASE 11—***An example of mistaken grouping. Histamine administered in a vasoconstrictor case with marked deterioration.*

A woman aged 35 already severely debilitated had suffered from dizzy spells of increasing frequency for eight and one-half years. When seen (in February 1940) she was having attacks almost daily. An intradermal histamine test was mistakenly adjudged positive and she was started on a course of desensitization. There was the usual immediate improvement while the drug acted as a vasodilator. After three weeks however attacks started again and became increasingly severe. Histamine was stopped and nicotine acid substituted, with immediate improvement. After one month of intensive treatment she ceased to have any severe attacks and after a further two weeks was relieved of attacks of any sort though still occasionally noticing a mild unsteadiness. Later she became pregnant for the first time after eleven years of married life without contraceptives, and her condition improved still more presumably as a result of further vasodilatation. Administration of nicotine acid was maintained throughout pregnancy. Except for a few minor attacks in the last two months the pregnancy was uneventful, and except for a month immediately after the birth of the child when she was having no treatment and had several (six to eight) minor attacks she has had no further trouble. Dosage of nicotine acid is now being gradually diminished without, so far, further attacks (October 1941, six months after delivery).

**CASE 14—***A case in which histamine was used despite a negative intradermal test.*

This case is particularly instructive. A newly qualified doctor aged 26 had started in November 1940, nine months before being seen to have prostrating attacks of dizziness which were diagnosed by himself correctly as Meniere attacks. They occurred

in batches of three or four at intervals at first monthly and then becoming more frequent. He tried, under advice, several accepted methods of treatment without effect. Then he performed on himself a histamine cutaneous test, which he correctly adjudged negative. Nevertheless, because he had read of the use of histamine for this condition and was impressed thereby, he decided to try histamine. This he did, first on his own account according to the method of administering it which I have adopted later under supervision and strictly according to directions received from the Mayo Clinic. It produced no noticeable improvement. On one occasion during an acute attack in the hospital he was given histamine intravenously, but the attack did not cease until eight hours later. The second day it was given again and the third, when it was followed in half an hour by an attack. It was persisted with and his attacks gradually increased in severity and frequency. Eventually he was persuaded to discard histamine and take to nicotinic acid a change which resulted in immediate though slow improvement. Attacks became less severe and less frequent and have now ceased though not for a period long enough to say that the result is permanent. Improvement was much slower than usual which may have been because of the long period of treatment with histamine which preceded the change, an effect which has been observed in other cases.

## CAUSTIC EFFECT OF SODIUM SULFATHIAZOLE SOLUTION ON NASAL MUCOUS MEMBRANES

### RESULTS OF ANIMAL STUDIES

CHARLES E. FUTCH, M.D.

LOYD K. ROSENOLD, M.D.

AND

CHARLES E. STEWART, JR., M.D.

LOS ANGELES

It has long been the hope of rhinologists to find a medicament which, when applied in the nose and sinuses, would be bactericidal or at least bacteriostatic to pathogenic organisms yet spare the delicate ciliated membranes. Turnbull's<sup>1</sup> favorable recommendation of a nasal spray of 5 per cent sodium sulfathiazole no doubt raised such hopes. It has been difficult at large for specialists in otolaryngology to accept this recommendation. The complexity of chronic sinusitis is known too well to expect an eradication of infection, degenerative pathologic changes and the constitutional factors involved by the use of one medicament. Chronic sinusitis is not a specific disease, and success cannot be expected when it is so treated. Fletcher<sup>2</sup> has reported on the caustic action of sodium sulfathiazole in the maxillary sinus in 1 case.

The present report describes the effect of solutions of sodium sulfathiazole in 5 and 30 per cent concentrations when applied to the nasal mucous membranes of rabbits.

### METHOD OF STUDY

Approximately 1 cc of 5 per cent aqueous solution of sodium sulfathiazole was instilled into both nostrils of each rabbit three times daily. At intervals of two days 1 animal was killed until at the end of ten days

From the Department of Otolaryngology at the College of Medical Evangelists.

Read before the Los Angeles Society of Ophthalmology and Otolaryngology, Nov. 24, 1941.

Prof. Benton N. Colver of the College of Medical Evangelists gave suggestions, and Dr. Roland H. Osborne, pathologist of the White Memorial Hospital, assisted and cooperated in the preparation of the slides and interpretation of the pathologic findings.

PROPERTY OF THE  
NATIONAL COLLEGE

animals had been killed. A sixth rabbit was allowed an additional seven days of recovery without further medication before it was studied. An untreated rabbit was used as a control. Death was accomplished by injecting air into the large vein of the ear. Local effects of the drug in powder form could not be determined, since its use in this form was found to be impracticable, a saturated solution of sodium sulfathiazole which represents a 30 per cent concentration of the drug was used instead. One additional rabbit was used for this experiment.

The heads of the animals were fixed in solution of formaldehyde, frozen with solidified carbon dioxide and cut in coronal serial sections about 3 mm thick. The next step was to decalcify the identical sections of each rabbit, after which microscopic sections were made, mounted and stained.

#### FINDINGS

The first slide after two days' instillation showed obvious changes. The mucous blanket was thickened, the cilia were indistinct and the columnar and basal cells showed some vacuolization. The blood vessels of the submucosa were dilated. Slides of the fourth, sixth, eighth and tenth days showed progressive destruction, the mucous blanket became more irregular with breaks in continuity. The ciliary layer after the eighth day was entirely indistinguishable, as were the cells of the columnar and basal cells. The basal cellular layer became progressively thicker, in some places four to five cells in thickness, and these cell walls were not distinct. There was some infiltration of small mononuclear cells and lymphocytes in the submucosa.

The turbinates showed a progressive displacement of the normal epithelium by a transitional type of epithelium several times the thickness of the normal cells.

The mucous membrane from the animal, which was allowed seven days for recuperation after ten days' instillation, showed remarkably little recovery at the end of this time. The mucous blanket was still impeded, and no ciliary or columnar layers were yet distinguishable. The basal cells were observed one to two cells in thickness and showed fused nuclei. Engorgement of the submucosa still existed.

The experiment in which the saturated solution of sodium sulfathiazole was used resulted in a more complete destruction of the membrane with occasional areas of ulceration. Other areas showed flattening out of the surface layer of epithelium six to seven cells in thickness, an apparent metaplasia to the stratified squamous type. This metaplasia as observed was interpreted as a protective reaction.

#### COMMENT

The studies we have presented would seem to indicate that a 5 per cent solution of sulfathiazole sodium squihydrate is injurious to the nasal mucous membrane of rabbits. The cilia and the superficial layers of columnar cells are to a large extent destroyed, and even after one week recovery does not take place. Hydrogen ion concentration determinations revealed that at both the 5 and 30 per cent solutions had a  $pH$  approximately 10. This is in accordance with Fletcher's findings and also the statement of a commercial house distributing the product. It is possible that the high degree of alkalinity of the solution may be a factor in causing the mucosal damage noted in these experiments. This possibility is especially interesting

in view of the recent findings of Fabricant<sup>3</sup> that the normal  $pH$  of human nasal secretions is in the acid range.

Literature advertising the use of 5 per cent sodium sulfathiazole states that this solution is isotonic, which may be somewhat misleading to those interpreting the term isotonic as meaning nonirritant. In the future, soluble combinations of the sulfonamides without caustic properties may be produced. Such solutions might prove useful.

#### CONCLUSIONS

1 Solutions of sodium sulfathiazole exert an early and severe destructive effect on the nasal mucosa of rabbits. This is true when the 5 per cent solution has been used as a nasal instillation.

2 After one week's rest from instillations there was little recovery from this destructive process.

3 Nonirritant chemical combinations of the sulfonamides may be possible and prove useful in the future.

## DEATH DURING SULFATHIAZOLE THERAPY

### PATHOLOGIC AND CLINICAL OBSERVATIONS ON FOUR CASES WITH AUTOPSIES

MAX LEDERER, M.D.

AND

PHILIP ROSENBLATT, M.D.

BROOKLYN

With the extensive therapeutic use of sulfathiazole, reports of untoward reactions have appeared in the literature. Many of these have been of a transient nature while others have been more serious and have terminated in death. Cases studied at autopsy have not been many and postmortem observations have been few. Therefore it seems timely to report 4 fatal cases in which sulfathiazole appears to have played an important role and in which lesions attributable probably to the action of the drug were found in various organs. Furthermore, certain definite information has been gleaned whereby the toxic action of this valuable drug may be minimized and fatalities from its indiscriminate use averted.

From an experimental point of view, the toxicity of sulfathiazole and its pathologic effects have been studied by Rake, van Dyke, Corwin and their associates,<sup>1</sup> by Long and his associates<sup>2</sup> and by others.<sup>3</sup> These observers found that in acute toxicity experiments on mice sulfathiazole was less toxic than sulfapyridine but

that in chronic toxicity the toxic was the rule. Lesions were limited chiefly to atrophy of the spleen with changes in the malpighian bodies and to the presence of concretions in the renal tubules, pelvis and urinary bladder. In 1 mouse, focal necrosis of the liver was reported. In rats and monkeys sulfathiazole was found to be less toxic than sulfapyridine, and the lesions produced were slight and chiefly in the kidneys. Evidence of renal damage in 1 monkey included the presence of casts in the urine, interstitial necrosis, hyaline nephrosis and "signs of primary renal injury."

The experiments of Gross, Cooper and Scott<sup>3</sup> on rats showed the incidence of urolithiasis caused by sulfathiazole to be less than that caused by sulfapyridine. When associated with secondary infection and pyelonephritis it occasionally caused death. They also showed that the sulfathiazole uroliths, like those caused by sulfapyridine were liable to spontaneous solution and disappearance. The term "urolithiasis medicamentosa" was suggested by them for the condition in which administration of drugs was followed by their deposition in the free or conjugated state as concretions in the kidneys and urinary passages.

In man the toxic effects of sulfapyridine and sulfathiazole on the kidneys are well known. Transient renal manifestations such as nitrogen retention, renal colic, hematuria, oliguria and the presence of sulfathiazole crystals in the urine have been reported by many writers.<sup>4</sup> Pepper and Horack<sup>5</sup> reported a case of bronchopneumonia in which more than transient renal complications were observed following the administration of sulfathiazole. At autopsy concretions were found obstructing the renal tubules, as well as in the pelvis and bladder. Microscopically, there were also small focal areas of subacute and healed pyelonephritis with tubular nephrosis, round cell infiltration and colloid and hyaline casts in the adjacent tubules.

Loewenberg, Sloane and Chodoff<sup>6</sup> reported a case of pneumococcemia treated with sulfathiazole in which autopsy showed concretions in the kidneys, ureters and bladder but in which there were no clinical signs of renal damage. Cutts, Burgess and Chafee<sup>7</sup> in a study of the therapeutic results with sulfathiazole and sulfapyridine in two comparable series of 30 patients reported a mortality rate of 10 per cent in each group. The 3 patients in the sulfathiazole group who died had nitrogen retention. In 1 case hematuria developed and blood sulfathiazole concentrations were 101 mg per hundred cubic centimeters free and 14 mg total. In

the other 2 cases the urinary output diminished greatly, 1 patient becoming completely anuric. In the case presenting total anuria, the renal lesions were described as follows:

The glomeruli are everywhere intact. There is extensive fatty metamorphosis of the convoluted tubular epithelium. Here and there, in an isolated tubule, there is necrosis of the epithelium, sometimes associated with an infiltration by polymorphonuclear cells, lymphocytes and large mononuclear cells. The cellular infiltration occurs both within the tubular lumen and in the surrounding interstitial tissue. The collecting tubules are frequently filled with hyaline casts, occasionally with polymorphonuclear leukocytes, and others are packed with desquamated epithelial cells. There is marked lymphocytic infiltration of the cortex and hyperplasia of the lining epithelium. The epithelium of the tubules at the junction of the cortex and pyramids is frequently packed with granules and aggregates of yellow pigment.

These authors, commenting on the possible influence of sulfathiazole in producing renal damage, suggested that the renal shutdown might have been due to overwhelming infection producing toxic renal damage rather than from direct action of the drug. Nevertheless, they stated that renal function should be watched closely until more was learned about the effects of sulfathiazole on the kidney.

Goodman and Gilman<sup>8</sup> state that information concerning the toxic potentialities of sulfathiazole is incomplete and that its ultimate chemotherapeutic evaluation awaits the result of a sufficient number of reports regarding its pharmacologic, toxicologic and therapeutic indications. So far as the writers know, the literature contains but one record<sup>9</sup> of an autopsy in which death was assumed to be directly or indirectly attributable to the ingestion of sulfathiazole and in which lesions were found in organs other than the kidneys. The pertinent observations were "acute agranulocytosis with membranous and gangrenous pharyngitis and laryngitis, focal membranous tracheitis, focal hemorrhagic bronchopneumonia, edema of the pharynx and larynx, and distinctive cloudy swelling of the myocardium, liver and kidneys."

#### REPORT OF CASES

CASE 1—History—R. N., a white girl aged 15 years, was admitted to the Jewish Hospital May 14, 1941. She had had acne and irregular menses for the past eighteen months. Since February 1940 she had been treated with hypodermic injections of an estrogenic substance in the first half of her menstrual cycle and gonadotropic substance in the second half. For the acne she was given desiccated thyroid, acne vaccine, ferrous sulfate and heliotherapy until April 12, 1941 without relief. On that date she was given 25 tablets of sulfathiazole, each containing 75 grains (0.5 Gm), to be taken one a day. The

terious sulfate was discontinued. Up to May 9 she had taken twenty-two tablets at which time mother series of twenty-five was begun. Three days later, shortly after taking a tablet, she began to complain of "prurpy" generalized itches and pains, chilliness, headache and a burning sensation in her eyes. The next morning her temperature was 104 F. Her physician ordered continuance of the sulfathiazole, increasing the dose

**Liver.** This organ weighed 1,280 Gm. The external and cut surfaces were red-brown mottled with yellow. The markings were indistinct.

**Kidneys.** The right kidney weighed 120 Gm. The capsule stripped easily and cleanly, revealing a smooth, shiny, red-brown bulging surface. In the cut surfaces it was difficult to recognize the corticomedullary distinction. The parenchyma bulged somewhat and was red-brown mottled with yellow. The cortex measured up to 6 mm in thickness. The pelvis was not distended and contained about 15 cc of clotted blood. On the surface of the clot, in places, there were pinpoint orange-yellow specks. A ureteral catheter extended into the pelvis of the kidney. Along the course of the ureter were small submucosal hemorrhagic areas. The ureteral orifices were patent. The left kidney weighed 150 Gm and was similar to the right kidney except for small petechiae beneath the mucosa of the pelvis. The ureteral orifice was patent and about it was a zone, about 5 mm in diameter, made up of tiny orange-yellow incrustations (fig 1) which analysis proved to be sulfathiazole. The urinary bladder was contracted and empty. The mucous membrane was very pale and boggy in places.

**Bone.** The vertebral marrow was red. The bony trabeculae were delicate.

**Spleen.** Culture from the spleen was sterile.

**Microscopic Examination.**—The tissues from all the cases were fixed in solution of formaldehyde and stained with hematoxylin-eosin and also by the Gram-Weigert method for bacteria.

**Lungs.** Scattered throughout the preparation were roughly round foci varying in size, arranged loosely or compactly and made up of a central core of amorphous material in which there could be demonstrated fibrin and nuclear fragments. These were surrounded by varying but small numbers of polymorphonuclear neutrophils, some small and large mononuclear cells and an occasional eosinophil and plasma cell. Remains of alveolar walls and some epithelial cells also were seen (fig 2). The

Fig. 1 (case 1).—Drawing of urinary bladder with incrustations of sulfathiazole in lower right (left ureteral orifice). Mucosa is greatly distended. Case 3 showed a similar picture.

to 15 grains (1 Gm) every four hours. She took six doses on May 13 and in addition to her other symptoms became delirious. The next morning she vomited after three attempts to take the tablets. It was then noticed that she had not voided since 4:30 p. m. the previous day despite forcing of fruit juices and fluids. On the way to the hospital in the ambulance she had generalized clonic convulsions.

**Physical Examination.**—The temperature was 105 F, the pulse rate 110 a minute and the respiratory rate 22 a minute. She had a diffuse papulopustular acne on the face, neck and shoulders. There was slight generalized muscular rigidity with hyperreflexia. A diagnosis of anemia due to sulfathiazole was made and she was given intravenous fluids in an attempt to stimulate renal function. Catheterization yielded 10 cc of curdled urine which contained innumerable sulfathiazole crystals, albumin, a moderate number of casts and a few white blood cells. The blood count showed a hemoglobin level of 74 per cent, 3,750,000 erythrocytes and 24,000 leukocytes, with 90 per cent neutrophils, 6 per cent lymphocytes, 2 per cent monocytes and 2 per cent eosinophils. Culture of the blood was sterile. Chemical examination of the blood showed 22 mg of free sulfathiazole per hundred cubic centimeters, 42 mg of urea nitrogen, a carbon dioxide combining power of 56.2 volumes per cent and 135 mg of sugar. After twelve hours cystoscopy was performed in an attempt to lavage the urinary passages. A catheter was easily passed into the pelvis of the right kidney, but several attempts on the left side failed because of an apparent obstruction 12 cm from the bladder. She died May 15 with a diagnosis of uremia due to sulfathiazole.

#### POSTMORTUM EXAMINATION

**Gross Examination.**—A complete postmortem examination was done. The body was well developed and well nourished. There was a papulopustular exanthem over the face and upper part of the chest.

**Lungs.** The external and cut surfaces were pink mottled with dark red-blue at the bases. They were crepitant and buoyant.

Fig. 2 (case 1).—Section of lungs ( $\times 250$ ), confluent foci of necrosis with slight peripheral reaction.

bronchioles were not distended. Their lumens contained pink staining granular material, epithelial cells, round cells and occasional white blood cells and red blood cells.

**Liver.** The capsule was thin. The arrangement of liver cells into cords and lobules was regular and distinct. In the connective tissue of the portal spaces there were some accumulations of mostly small and a few large mononuclear cells. The sinusoids were slightly distended and the Kupffer cells appeared

prominent. Scattered throughout the parenchyma and especially near the periphery of the lobules were various sized foci in which the cells had been destroyed. The remains of hepatic structures could be recognized in places by architectural remnants of cell membranes and connective tissue strands. The amorphous matrix of these areas contained nuclear fragments and debris. In some there were recognized a few small round

Fig 3 (case 1)—Section of liver ( $\times 250$ ) focal necrosis similar lesions found in cases 2 and 3

cells and about them there were a variable number of polymorphonuclear neutrophils and small round cells (fig 3).

**Kidneys** In a preparation from the right kidney within the cortex, the glomeruli were numerous and well distributed. They varied in size, some being larger and more cellular than usual. The capillary tufts were greatly distended. Bowman's capsule was thin. In some of the spaces there was granular pink staining amorphous material with an occasional red blood cell. The convoluted tubules were somewhat distorted. The lining cells were swollen to such a degree that the lumen was completely obliterated and the tubule appeared as a solid mass of structureless granular anuclear material (fig 4). The protoplasm of the surviving cells was granular and no hyaline droplets were seen either in the cells or in the lumens. In other places the cells showed evidences of a mild to moderately severe granular change. The collecting tubules were often tortuous and widely dilated and contained blood as well as granular or blood casts. The epithelium of these structures showed no remarkable change. In this preparation one tubule contained a crystalline object similar to those to be described in case 2. The stroma was not increased in amount or density and occasionally beneath the capsule it contained a few round cells. The peripelvic connective tissue contained some collections of small and large mononuclear cells, plasma cells and occasional polymorphonuclears. Some extravasations of blood also were found. The blood vessels throughout the kidney were congested. The preparation from the left kidney showed a somewhat similar picture. The changes in the convoluted tubules were more severe and extensive. In the cortex was a small focus of necrosis similar to that described in the liver. A preparation stained for fat showed an abundance of droplets in the epithelium of the convoluted and collecting tubules. Double refractile

lipoids were demonstrated in the epithelium of the convoluted tubules. The epithelium of the bladder was fairly well preserved and thrown into broad undulations. The tunica propria was extremely edematous and composed of delicate fibrous tissue which was widely separated by clear spaces, owing to edema. Numerous small and large mononuclear cells were diffusely scattered throughout. The muscularis was also broadened but otherwise not remarkable.

**Spleen** The follicles were numerous, well formed and evenly distributed. In some a few swollen reticulum cells could be seen. The sinusoids were greatly distended and the walls were prominent. In some areas there were extravasations of blood. A few collections of large numbers of polymorphonuclear leukocytes were occasionally seen. In some areas, particularly at the periphery of the malpighian bodies, small foci of necrosis similar to those already described were found (fig 5).

**Lymph Nodes** The cytoarchitecture was obscured by edema. The follicles were swollen and their boundaries merged almost imperceptibly with the pulp. The latter was loosely arranged and contained large numbers of plump reticulum cells. The sinuses were prominent and the vessels were distended.

**Bone Marrow** In the preparation from one of the lumbar vertebrae the bony trabeculae showed no unusual changes. Between them there was an abundance of hemopoietic cells. Scattered throughout were small irregularly shaped foci containing masses of amorphous material in which remnants of erythrocytes and immature leukocytes could be distinguished. These resembled those found in the other organs.

**Summary of Case 1**—A young girl after three weeks of treatment for acne with sulfathiazole had chills, fever and pyrexia. Despite the absence of positive physical manifestations to corroborate an infectious cause of the symptoms, she was given increased doses of the drug. This was followed by anuria and coma. High concentrations of sulfathiazole were found in the blood and

Fig 4 (case 1)—Section of kidney ( $\times 250$ ) focal congestion in glomeruli, few erythrocytes in Bowman's space, degeneration of tubular epithelium, dilatation of some and occlusion of other tubules similar lesions in case 2

crystals of the drug in the urine. In spite of discontinuance of the drug administration of fluids intravenously and ureteral catheterization the patient died fifty hours after onset of the anuria.

The anatomic diagnosis was acne vulgaris, sulfathiazole urolithiasis, petechiae and hemorrhage in the pelvis and ureter, edema in the bladder, focal necroses in

the liver, spleen, lungs, kidney and bone marrow, nephrosis and splenomegaly. The final impression was one vulgaris with sulfathiazole intoxication showing visceral focal necroses and nephrosis.

CASE 2—History—H. K., a white man aged 60, was first admitted to the Jewish Hospital three weeks before the present illness for the repair of a hernia. His course was satisfactory

Fig. 5 (case 1)—Section of spleen ( $\times 125$ ), foci of necrosis, similar lesions in cases 2 and 3.

until the tenth postoperative day, at which time his temperature rose to 102 F, and a few rales were heard at the base of the left lung. He was given sulfathiazole and two days later his temperature was 99 F. He was discharged in good condition except for a few residual rales at the base of the left lung. A sulfathiazole determination on his blood before discharge showed a total concentration of 86 mg per hundred cubic centimeters. At home the drug was continued. On August 8 he had a chill and a temperature of 105 F, and a generalized maculopapular erythematous rash developed. The sulfathiazole was continued because it was thought that the rise in temperature indicated an infection. His temperature remained high, and he gradually lapsed into coma, becoming incontinent of urine and feces, and was readmitted to the hospital the following day. Up to this time he had taken 660 grams (44 Gm) of sulfathiazole.

Physical Examination—On readmission the patient was semicomatose. His temperature was 104 F, the pulse rate 120, the respiratory rate 30 a minute and the blood pressure 130 mm of mercury systolic and 70 diastolic. There was a diffuse generalized rash over the body. He was dehydrated and his respirations were labored. The conjunctivas showed congestion with slight chemosis. There were coarse rales at the base of the left lung. The clinical impression was sulfathiazole intoxication, sepsis and pneumonia. He was catheterized and 1 ounce (30 cc) of cloudy urine containing many granular casts and a trace of albumin was obtained (the urine previously had been normal). Examination of the blood showed urea nitrogen of 51.2 mg per hundred cubic centimeters and total sulfathiazole of 118 mg. He continued anuric and cystoscopy was done, yielding about 1/2 ounce (15 cc) of bloody turbid urine. The bladder showed a "sandstorm" appearance which was interpreted as being due to either sulfathiazole crystals or mucofibrin. Despite attempts to stimulate renal function by means of hypertonic dextrose solution and intravenous sodium sulfate, the patient remained anuric. On August 15, decapsulation and right nephrotomy were done. He died two hours later. A blood sulfathiazole determination on August 13 was 13 mg

per hundred cubic centimeters total and 8 mg free. On August 15, the day of his death, the free sulfathiazole was 8 mg per hundred cubic centimeters.

POSTMORTEM EXAMINATION

Gross Examination—A complete autopsy was performed. The conjunctivas were smoky, injected and studded with pinpoint areas of red.

Lungs The trachea and bronchi contained gray-green, tenacious, mucoid material. The lungs were crepitant and buoyant.

Liver This organ weighed 1,830 Gm. The external and cut surfaces were pale brown, interspersed with small yellow areas. The markings were very prominent.

TABLE 2—Determinations of Sulfathiazole in the Tissues in Case 2

|           | Free Sulfathiazole, Mg per 100 Gm | Total Sulfathiazole, Mg per 100 Gm | Acetylation, Percentage |

| Dry basis | 23.1                              | 36.0                               | 35.8                    |

Kidneys The right kidney weighed 190 Gm and was decapsulated. The nephrotomy wound extended well into the pelvis of the kidney, which was filled with clotted blood. The mucosal lining of the ureter was discolored red-brown in places. The surface of the kidney was pale and showed many pinpoint areas of red. The sectioned surfaces were of similar color and streaked with red-brown. The cortex and medulla were difficult to differentiate. The pelvis was red-purple in places and contained some clotted blood. The left kidney weighed 160 Gm. The capsule stripped easily and revealed a smooth, pale, bulging, brown surface similar to that of the right kidney. The cut surfaces also resembled those of the right kidney. The ureteral

Fig. 6 (case 2)—Crystals in tubules of kidneys ( $\times 1,000$ ), also found in case 1.

orifices were dilated and the bladder mucosa about the orifices was swollen and edematous. The bladder was empty.

Spleen This organ weighed 250 Gm. The external and cut surfaces were purple. On section the fibrous markings and follicles were distinct.

Bone The bone marrow was bright red and abundant.

Microscopic Examination—Liver The capsule was slightly thickened. The arrangement of cells into cords and into lobules was normal. The central veins and sinusoids were

distended. The Kupffer cells were prominent. The connective tissue of the portal spaces contained dense collections of small and large mononuclear cells as well as an occasional polymorphonuclear neutrophil. Scattered throughout the parenchyma were small foci of necrosis which were similar to those described in the previous case (fig 3).

**Kidneys.** In a preparation from the left kidney the capsule was slightly thickened. Beneath it were a few wedge shaped

Fig 7 (case 2)—Crystals in tubules of kidney ( $\times 700$ ) also found in case 1.

areas composed of dense fibrous connective tissue surrounding hyalinized glomeruli and containing small and large round cells. Otherwise the glomeruli were numerous, evenly distributed and for the most part, well preserved. The capillary tufts were congested. An occasional Bowman's capsule was thickened and the cells assumed a basophilic appearance. The convoluted tubules presented a variegated picture. The epithelial cells were swollen, the cytoplasm was coarsely granular and the nuclei were pyknotic, fragmented or absent. In some the swollen and degenerated epithelium obstructed the lumen completely. Many lumens harbored lavender or blue staining crystalline deposits which were oval or round. A few appeared homogeneous, others showed lines which radiated out from the center. Many of them appeared split into triangular segments, giving a spoke-wheel appearance (figs 6 and 7). Occasionally they were embedded in casts of amorphous pink staining material. Many of the collecting tubules were noticeably distended. The epithelium in these was intact. In some places, particularly beneath the capsule, were foci of necrosis similar to those seen in the other organs. Occasional small and large round cells were seen scattered sparsely and diffusely in the stroma. The peripelvic connective tissue contained extravasated blood cells, some collections of round cells and occasional polymorphonuclear neutrophils. Examination of the right kidney showed a similar picture.

**Adrenal Glands.** In a preparation from one of the adrenal glands the capsule was delicate and contained distended capillaries. The arrangement of the cell layers was orderly. Scattered throughout were small focal areas of necrosis exactly like those seen in other organs. These were found particularly in the zona fasciculata and zona reticularis. The medullary tissue appeared to be uninvolved.

**Bone Marrow.** In a preparation from a lumbar vertebra, the chondro osseous junction was narrow and even. The bony trabeculae were narrow and enclosed spaces which harbored a good number and variety of hemopoietic cells as well as megakaryocytes. Small focal areas of necrosis were scattered diffusely throughout. These were composed of granular cellular debris similar to those in case 1.

**Summary of Case 2.**—An elderly man who had been operated on for the repair of a hernia had a slight temperature and vague pulmonary signs on the tenth postoperative day for which he was treated with sulfathiazole, the drug being continued after his discharge. Eight days later he had a chill, his temperature rose to 105 F and a maculopapular rash appeared. He lapsed into coma and became rapidly anuric. Catheterization and renal decapsulation with pelvic drainage were resorted to in attempts to stimulate and reestablish kidney function without avail. On discharge from the hospital his blood showed a total sulfathiazole level of 86 mg per hundred cubic centimeters. Two days before death it was 8 mg per hundred cubic centimeters in the free state.

The anatomic diagnosis was nephrosis, focal necroses in the liver, kidneys, adrenal glands and bone marrow, deposits in kidney tubules (sulfathiazole?), splenomegaly, interstitial hepatitis, dermatitis, acute conjunctivitis. The final impression was sulfathiazole intoxication with visceral focal necroses and nephrosis.

**Case 3.**—A white man aged 71 had had hypertension for ten years, albuminuria and pyuria intermittently for the past two years and some frequency and nocturia. Two weeks prior to admission he had an attack of chills and fever with pyuria and was given sulfathiazole. Nine days later his temperature was normal and examination of the urine showed a few clumps of leukocytes and a faint trace of albumin. His prostate gland was moderately enlarged. Intravenous pyelography revealed a picture suggestive of polycystic disease of the kidneys. Cystoscopy showed cystitis and trigonitis. Both ureteral orifices appeared normal. The middle lobe of the prostate gland was definitely enlarged and both lateral lobes were moderately enlarged. One day before admission he complained only of slight frequency of urination but during the night chills and

Fig 8 (case 3)—Section of adrenal gland (slightly reduced from a photomicrograph with a magnification of 190 diameters) focal necrosis also seen in case 2.

fever developed. On admission he appeared acutely ill. His temperature was 104.2 F, the pulse rate 96 and the respiratory rate 20 a minute. There were a few rales at the left base but no dulness or bronchial breathing. The clinical impression was polycystic disease of the kidneys with pyelonephritis. Sulfathiazole 15 grains (1 Gm) every four hours was continued and 2,000 cc of 5 per cent dextrose in saline solution was given parenterally. The next day his temperature was 104 F.

and he appeared lethargic. Catheterization yielded 4 ounces (120 cc) of residual urine with a faint trace of albumin and a few leukocytes and erythrocytes. *Escherichia coli* was cultured from the urine. Culture of the blood was sterile. The blood urea nitrogen was 11.5 mg per hundred cubic centimeters. Portable roentgenograms of the chest suggested bronchopneumonia infiltration throughout both lungs. On the second day he was comatose but lumbar puncture the next day yielded no additional information. Sodium sulfathiazole was administered by venoclisis. Neurologic examination indicated definite cerebral involvement which was interpreted as being due to the continued pyrexia. On the fourth hospital day the total blood sulfathiazole was 6.7 mg per hundred cubic centimeters. He died approximately ninety-six hours after admission. During hospitalization he received a total of 240 Gm of sulfathiazole.

#### POSTMORTEM EXAMINATION

**Gross Examination**—The body was well developed and well nourished. The mucosa of the trachea and bronchi was covered with gray-green material. Beneath this exudate the mucosa was studded with slightly elevated firm, gray patches that measured up to 2 mm in diameter. These were especially numerous in the upper part of the trachea and in the right bronchus.

**Lungs** The lungs showed no unusual features.

**Liver** This organ weighed 1715 Gm. The external and cut surfaces were pale brown and contained numerous pinpoint

TABLE 3—Determinations of Sulfathiazole in the Tissues in Case 3

| Wet basis     | 9.9   | 10.0   | 10                        |
| Dry basis     | 14.7  | 14.6   | 20                        |

sized gray areas which were most prominent near the portal veins. These were scattered diffusely throughout the cut surface.

**Adrenal Glands** Together they weighed 28 Gm and showed no unusual features.

**Kidneys** The right kidney weighed 580 Gm. The external surface contained numerous thin walled, smooth lined cysts, measuring up to 6 cm in diameter, which were filled with clear amber fluid. They were irregularly scattered throughout. The capsule stripped with difficulty, portions of the cortex adhering to it, revealing a red-brown, fine and coarsely granular surface. The cortex and medulla were well demarcated. In places tiny yellow gray streaks were present. The left kidney weighed 520 Gm and was similar to the right. A nodular black calculus 1.6 cm in diameter filled one of the renal calices. Both pelvis and ureters were not remarkable. The bladder was contracted and thick walled. The mucosa was boggy and in places was a dull to an angry red. Between the ureteral orifices was a firm orange-yellow crystalline mucosal incrustation 3 mm in diameter, which gave the chemical reaction for sulfathiazole.

**Prostate Gland** This organ was moderately firm and enlarged. On section it was pale brown, mottled with areas of gray.

**Spleen** The spleen weighed 325 Gm. The external surface was slate blue, smooth and glistening. The cut surfaces were brick red and dry. The follicles and fibrous markings were distinct.

**Microscopic Examination**—**Heart** In a section of a branch of the coronary artery the walls of the vessel itself showed no unusual features. In the adventitia were focal areas of necrosis with infiltration by round cells and some polymorpho-

nuclear leukocytes. The lesion did not appear to be of an inflammatory nature but rather one with a primary necrosis followed by cellular infiltration.

**Trachea** The mucosa was replaced in places by slightly raised plaques which consisted chiefly of amorphous granular blue-staining debris containing some remnants of nuclei. This process involved only the mucosa and began and ended abruptly. Well preserved tracheal ciliated epithelium could be seen adjacent to the borders. In the submucosa just beneath these lesions there were infiltrations with round cells and polymorphonuclear leukocytes.

**Lungs** In a preparation from the right lung, the pleura was slightly thicker than usual and contained numerous large mononuclear cells filled with black pigment granules. The alveoli were broad and empty, and many were confluent. The interalveolar septums were delicate and in places appeared disrupted. The mucosal lining of the bronchioles was well preserved and the lumens contained desquamated epithelial cells. The walls were thickened and infiltrated with polymorphonuclear leukocytes and small and large round cells. The walls of the larger arteries were slightly thicker than usual and their lumens narrow. A preparation from the left lung was similar except that in one small area the alveoli were filled with varying amounts and proportions of red blood cells, polymorphonuclear leukocytes and small and large mononuclear cells. A bronchiole in this region contained amorphous pink staining material, poorly preserved polymorphonuclear leukocytes, small and large mononuclear cells, desquamated epithelial cells and clumps of blue-staining cocci.

**Liver** The architectural pattern was not altered. In some places the liver cells appeared to be swollen and the protoplasm was granular. The sinusoids and the central veins were distended and the Kupffer cells very distinct. Scattered throughout were small areas in which the liver cells showed various degrees of degeneration to complete destruction. Most of these foci were situated in or near the midzones of the lobules, occasionally being found adjacent to central veins or portal areas. They were composed of the remains of liver cells, nuclear fragments and debris, together with a variable degree of infiltration with small round cells and some polymorphonuclear neutrophils.

**Spleen** The follicles were numerous and well distributed. Occasional germinal centers were seen which were composed of swollen, poorly preserved reticulum cells. The endothelial cells lining the sinuses were swollen and appeared prominent. The pulp was the seat of congestion and hemorrhage. Scattered throughout were varying sized foci of necrosis with little cellular reaction. The sinusoids were distended and contained numbers of polymorphonuclears and large mononuclear cells.

**Adrenal Glands** In preparations from the adrenal glands there were foci of necrosis similar to those in the other organs (fig. 8). These involved the deeper portions of the zona fasciculata and the zona reticularis. None were found in the medulla.

**Kidneys** In a preparation from the right kidney the capsule was thick and composed of dense bands of fibrous tissue containing an occasional round cell. In one place beneath the capsule there was a roughly wedge-shaped area which was made up of a dense fibrous tissue stroma with numerous small and large mononuclear cells and distended capillaries. In the deeper layers of the cortex were several round areas in which no tubules or glomeruli could be distinguished. These contained closely packed, poorly preserved polymorphonuclear leukocytes, nuclear debris, small and large round cells and some fragmented epithelial cells. In other places a few of the glomeruli were replaced by hyalinizing fibrous tissue. The glomeruli were congested. The epithelium of the convoluted tubules was well preserved and the lumens were empty. Scattered throughout were many cysts. The left kidney was similar to the right.

**Urinary Bladder** The surface was corrugated. The membrana propria was edematous and contained an occasional focus of necrosis similar to foci described in other organs.

**Prostate Gland** The acini varied much in size. Some were empty, others contained pink staining material and some leuko-

cytes. Still others were greatly dilated and lined by one or more layers of cuboidal cells. About many of these the stroma was densely infiltrated with large numbers of polymorphonuclear leukocytes and a few round cells.

**Me-enteric Lymph Node.** Preparation showed diffuse edema. The follicles were difficult to identify. Some appeared compact

Fig. 9 (case 3)—Section of lymph nodes ( $\times 185$ ), focal necrosis also found in cases 1 and 2.

and occasionally in their centers there were compressed masses of pink and purple staining necrotic debris. Scattered throughout the pulp were many areas of necrosis varying in size and shape, some being extensive and confluent. Poorly preserved leukocytes were scattered throughout. The reticulum cells were swollen and increased in number. An occasional foreign body giant cell could be recognized (fig. 9).

**Bone Marrow.** In preparations from a rib and a lumbar vertebra the bony trabeculae appeared as usual. The marrow was composed of the usual variety of cells and was abundant. However, scattered throughout were a number of irregularly shaped foci which contained red blood cells in various stages of destruction together with amorphous debris and nuclear material (fig. 10).

**Summary of Case 3.**—An elderly man who had intermittent symptoms referable to the prostate gland for about two years two weeks before admission had an attack of chills, fever and pyuria and was treated with sulfathiazole. He apparently responded favorably to the treatment. Five days before admission the abnormal urinary findings were slight. His temperature was normal. However, the drug was continued and on the night before admission chills and fever occurred. In the hospital, the urinary changes were slight with the exception that *Escherichia coli* was cultured from the catheterized specimen. Roentgen examination suggested bronchopneumonia, and because of this diagnosis, together with a possible suppurative nephritis, full doses of sulfathiazole were given. The patient continued feverish and rapidly lapsed into coma. He died fifty hours after admission.

The anatomic diagnosis was focal necroses in the liver, kidneys, spleen, adrenal glands, lymph nodes, urinary bladder, trachea, coronary artery and bone marrow, sulfathiazole urolithiasis, edema in the bladder, abscesses and overgrowth of the prostate gland and kidneys, nephrosclerosis, polycystic kidneys,

nephrolithiasis (left side), splenomegaly, necrotic tracheobronchitis, focal pneumonia (left side). The final impression was urinary infection, tracheobronchitis and terminal pneumonia with sulfathiazole intoxication.

**Case 4—History.**—A white woman aged 32 was admitted to the Jewish Hospital Jan. 27, 1942. In April 1940 she was treated for sinusitis with sulfamylamide. In September 1941 she complained of fatigue and vague symptoms which occurred intermittently. At this time her urine contained a faint trace of albumin and occasional red and white blood cells. Chemical examination of the blood revealed nonprotein nitrogen 50.7 mg. per hundred cubic centimeters and urea 23.5 mg. Six days prior to admission the patient noted a dry, nonproductive cough and three days later malaise and pain low in the back. The night before admission she had a chill and the next morning her temperature was 102 F. Her physician prescribed 15 grains (1 Gm.) of sulfathiazole every three hours. By that evening she had taken 52.5 grains (3.4 Gm.) of the drug and her temperature had risen to 106 F. She now complained of severe headache and pain in the back and was referred to the hospital.

**Physical Examination.**—On admission her temperature was 105.4 F., pulse rate 134, respiratory rate 40 and blood pressure 104 systolic and 54 diastolic. She appeared acutely ill. There was a dry, nonproductive cough. The sclerae were injected. The pharynx was red. Occasional fine rales were heard over the left side of the chest posteriorly. Sulfathiazole therapy was continued together with equal doses of sodium bicarbonate. During the night a generalized papular rash on an erythematous background appeared and the drug was discontinued. She had received a total of 45 grains (3 Gm.) of sulfathiazole in the hospital. The next morning it was noticed that she had not voided since admission. Catheterization yielded 60 cc. of turbid urine which contained albumin and a few casts and white blood cells. The blood count showed 25,000 white blood cells with 92 polymorphonuclear leukocytes. The patient com-

Fig. 10 (case 3)—Section of bone marrow ( $\times 90$ ) area of focal necrosis also found in cases 1 and 2.

plained of nausea, and she vomited several times. Intravenous fluids were given but the temperature remained elevated and she died about twenty-six hours after admission. Laboratory data included a blood urea nitrogen determination of 47.6 mg. per hundred cubic centimeters, a total sulfathiazole concentration in the blood of 13.9 mg. per hundred cubic centimeters and a negative blood culture. The clinical impression was bronchopneumonia complicated by sulfathiazole intoxication.

POSTMORTEM EXAMINATION

**Gross Examination**—The body was well developed and well nourished. There was a papulopustular rash over the face, ears, neck, upper part of the chest and back and the upper arms.

**Lungs** The external and cut surfaces were pink mottled with black. They were crepitant and buoyant.

**Liver** The liver weighed 1,680 Gm. The external and cut surfaces were pale red-brown. The lobular architecture was distinct, and scattered throughout were tiny yellow pinpoint areas.

**Kidneys** The right kidney weighed 170 Gm. The capsule was thick and could be stripped easily but not cleanly, revealing a pale brown surface containing several linear depressed scars. In the cut surfaces cortex and medulla were easily differentiated and measured respectively up to 7 mm and 1.6 cm in the axis of a pyramid. The cortical markings were irregular and scattered throughout the parenchyma were tiny irregular yellow areas. The left kidney weighed 180 Gm and was similar to the right.

**Spleen** The spleen weighed 530 Gm. The external surface was slate blue, smooth and glistening, shining through it were several tiny yellow pinpoint specks. The cut surfaces were red-brown revealing similar yellow areas scattered throughout. The malpighian corpuscles were distinct.

**Microscopic Examination**—**Heart** Within the myocardium of the left atrium were several irregular areas composed of poorly preserved muscle fibers surrounded by partially broken down polymorphonuclear leukocytes, small and large round cells and occasional plasma cells and eosinophils. In other areas the myocardial fibers were swollen and their nuclei were pyknotic or absent and the cytoplasm was granular.

**Lungs** In preparations from both lungs the walls of the bronchioles and bronchi were edematous and infiltrated with small and large round cells as well as occasional polymorphonuclear leukocytes.

**Liver** Scattered throughout the preparation were small foci of necrosis similar to those described in the previous cases.

**Adrenal Glands** In a preparation from one of the glands there was a large rounded area of necrosis within the cortex.

**Kidneys** In a preparation from the right kidney the capsule was thicker than usual and composed of dense bands of fibrous tissue infiltrated with small and large round cells. Within the cortex the glomeruli were fairly well distributed, large and slightly decreased in number. The glomerular capillaries were not prominent. Some of the glomeruli were either wholly or partially replaced by hyalinizing fibrous tissue. The collecting tubules presented a varied appearance and were arranged in irregular fashion. The lumens of many contained pink staining fibrillar or granular pink staining material. Some contained polymorphonuclear leukocytes. In many of the convoluted tubules the cells appeared swollen and the cytoplasm was pink staining and granular. The nuclei were pyknotic and in many instances could not be made out. The interstitial tissue was increased in amount, edematous and extensively infiltrated with small and large round cells as well as polymorphonuclear leukocytes. Scattered throughout the cortex as well as the medulla were small foci composed of necrotic epithelial cells surrounded by polymorphonuclear neutrophils. The loops of Henle and collecting tubules were fairly well preserved but some contained amorphous pink staining material. The urothelium lining a portion of the pelvis was partly desquamated. The underlying tissue was loose, edematous and moderately

infiltrated with small and large round cells. A preparation from the left kidney was similar.

**Spleen** The follicles were numerous and well distributed. No germinal centers were seen. The endothelial cells lining the sinuses were prominent and the channels contained an increased number of polymorphonuclear leukocytes. These cells were distributed in increased numbers throughout the pulp. In places were varying sized foci of necrosis, some with moderate cellular reaction.

**Skin** In a preparation from the skin of the back of the neck the surface was covered by a narrow band of keratinizing stratified squamous epithelium with blunt rete pegs. In places were masses of poorly preserved polymorphonuclear leukocytes (pus). In one area there was a small clear space between the corium and the epidermis which contained a small amount of pink staining homogeneous material and a few polymorphonuclear leukocytes. The corium was loose and edematous and the blood vessels were distended. Collars of round cells and polymorphonuclear leukocytes surrounded the capillaries, and similar cells were seen within the papillary layer of the dermis.

**Summary of Case 4**—A woman who had received sulfanilamide about a year prior to her present illness apparently had had some renal disease, as evidenced by albuminuria, the presence of red and white blood cells in the urine and some nitrogen retention in the blood, six months prior to hospitalization. Her present illness began with signs suggestive of bronchopneumonia, for which she was treated with sulfathiazole. After having taken 52.5 grains (3.4 Gm.) of the drug her temperature rose from 102 to 106 F. She was then hospitalized. Sulfathiazole was continued and she took an additional 45 grains (3 Gm.) of the drug before it was noted that she had a generalized cutaneous rash. Because she had not voided since admission catheterization was performed, yielding 60 cc. of turbid urine containing albumin, casts and white blood cells. She died about nine hours later. Before death a blood sulfathiazole determination showed a total concentration of 13.9 mg. per hundred cubic centimeters.

The anatomic diagnosis was nephrosis, focal necroses in the kidneys, liver, spleen and adrenal gland, acute, focal myocarditis with necrosis, toxic dermatitis with focal necrosis, chronic pyelonephritis, and chronic bronchitis. The final impression was bronchitis and chronic pyelonephritis and death during sulfathiazole therapy.

COMMENT

Clinically and pathologically, the similarities in the 4 cases are striking. In each sulfathiazole was given uninterruptedly. During the therapy a sudden episode of chills and fever, sometimes associated with a rash, conjunctival injection or myalgia and arthralgia occurred. These symptoms were interpreted as being due to infection, and the drug was continued in the original or in increased amounts. However, the fever persisted, coma rapidly developed and in 2 cases anemia became a prominent feature.

Cultural and histologic search failed to demonstrate bacteria in the lesions in all the cases. In one, *Escherichia coli* communis was cultured from the urine during life, but autopsy revealed no evidence of infection in the focal necroses. In this case miliary abscesses were found microscopically in the prostate gland and kidneys, but these were not considered of sufficient severity and extent to explain death. The concomitant finding of widely scattered areas of focal necroses not characteristic of miliary foci of infection confirmed the impression of sulfathiazole intoxication. Terminal tracheobronchitis and a mild bronchopneumonia were also present.

The gross conditions found at necropsy in all cases, except for sulfathiazole miltihrasis, were not significant. The kidneys were pale and swollen. The cortical markings were indistinct and resembled those of nephrosis. The urinary bladders were contracted and the walls edematous. Gross obstructions were not found anywhere in the urinary tract. The spleens were moderately enlarged and firm and the cut surfaces were dry, presenting prominent malpighian corpuscles. Experimentally the spleen in mice has been described as atrophied. This was not found in the cases reported.

Microscopically, however, numerous areas of necrosis were scattered in most of the viscera, with the exception of the central nervous system and the gastrointestinal tract. These were miliary in size and varied greatly in their distribution and number, being most numerous in the liver in all parts of the hepatic lobules, the favorite situations being in the central and peripheral zones. The focal necroses in the spleen were most frequently found within or at the periphery of the malpighian corpuscles and were associated with hyperplastic changes in the reticulum. The lymph nodes showed a similar picture. In the adrenal glands in 3 cases the necrotic foci were found in the deeper portions of the zona fasciculata and zona reticularis. The medulla was not involved. The bone marrow contained necrotic foci in 3 of the 4 cases. These varied in number and size, and extensive areas of uninvolved hemopoietic tissue accounted for the absence of decided changes in the peripheral blood picture. Occasional foci were encountered in the trachea, lungs, wall of a coronary artery, skin, and urinary bladder. In the kidney, in addition to areas of focal necrosis, evidence of severe parenchymal damage was strong. The tubules were primarily affected and showed profound degenerative changes of a nephrotic character. The lumens of many were dilated and many contained cells, casts and blood, some to the degree of complete obstruction. In 2 cases there were found blue-staining crystalline structures, the exact nature of which was not determined. It is possible that they represent precipitated sulfathiazole in some unusual form, since the free or acetylated varieties dissolve in the ordinary processes of fixation and staining. This formation may have been a chemical or physical combination of the drug with calcium.

#### SUMMARY OF PHARMACOLOGIC OBSERVATIONS

Experimentally and clinically it has been found that sulfathiazole is rapidly absorbed from the intestinal tract and that its excretion by the kidneys is rapid if renal function is adequate. The extent of acetylation was found by Sadusk, Blake and Seymour<sup>10</sup> to vary usually from 0 to 30 per cent, the median being approximately 12 per cent. According to Lehr, Antopol and Churg,<sup>3</sup> the extreme rapidity of absorption and excretion of sulfathiazole supports the view that acute precipitation in the urinary tract is due chiefly to the high rate of elimination from the body. Strauss and his co-workers<sup>11</sup> determined that the concentration of sulfathiazole is higher in the kidney than in the blood and other organs. Concentration of the free drug in the liver is higher than the blood concentration and the degree of acetylation lower than the blood concentration.

In only the first case was the blood concentration of sulfathiazole extremely high (22 mg per hundred cubic centimeters free). Unfortunately, the total sulfathiazole was not determined so that the degree of acetylation is not known. However, postmortem determinations revealed higher concentrations of the drug in the kidney than in the liver or blood. The proportion of acetylation in the kidney (38.8 per cent) was also higher than in the liver (25 per cent). The amount of sulfathiazole in the blood clot in the renal pelvis, which probably represented excreted material, was significantly much higher than that within the kidney itself. In the second case the results were similar, albeit at a much lower level. The concentration and degree of acetylation were higher in the kidney than in the liver, spleen and blood. In the third case, however, the blood concentration and degree of acetylation were higher in the blood and the concentration of sulfathiazole was lowest in the kidney. In the fourth case the concentration and degree of acetylation were highest in the urine and next highest in the kidney. The total concentrations of sulfathiazole in the liver, spleen and blood were fairly similar, but the degree of acetylation in the blood approaching that of the kidney was higher than that of the spleen and liver. Because of the limited number of observations no interpretation of these data is submitted at this time.

#### MODE OF TOXIC ACTION

Hypersensitivity to small doses of sulfathiazole has been reported by Stiles,<sup>12</sup> Finland, Peterson and Strauss<sup>13</sup> have emphasized that serious complications such as drug fevers, rashes and granulocytopenia occur with increasing frequency the longer drug therapy is maintained. In all the cases reported, chills and fever occurred during the course of treatment but only in 2 cases was there a rash unless the tracheal lesion in case 3 is interpreted as an enanthematous manifestation. Anuria rapidly developed in 3 cases. As far as is known, the lesion of focal necrosis has hitherto not been described except experimentally by Rake, van Dyke and Corwin.<sup>14</sup> In the course of toxicity determinations, they found areas of focal necrosis in the liver of 1 mouse.

According to Karsner,<sup>14</sup> toxic causes of focal necrosis include certain chemical poisons and the toxins of parasites or saprophytic organisms. He also states that Auer has shown that it is possible to concentrate reacting substances in anaphylaxis so as to produce necrosis. The bacterial nature of the necrotic lesions here apparently has been excluded. The decision of whether they are the result of direct toxic action of sulfathiazole or of an acquired sensitivity to prolonged ingestion of the drug cannot be made at this time. It is possible that a combination of these factors obtained in the production of the lesion.

#### CONCLUSION

Four cases are described in which death attributable to sulfathiazole was associated with necrotic visceral lesions. From these cases, certain clinical conclusions can be drawn.

1 The indiscriminate and uncontrolled use of sulfathiazole is not without danger.

2 Examination of the urine during the course of therapy is important, since crystals of the drug in the

urine and hematuria are danger signals. In their presence therapy need not be interrupted so long as the fluid intake and output are adequate. Sodium citrate, sodium bicarbonate or some other alkaline salt may be given.

3 A chill occurring during the administration of sulfathiazole and followed by sustained fever should be regarded as a danger signal and sulfathiazole therapy should be discontinued at once.

4 Diminution and suppression of urinary output should be considered a contraindication to further administration of the drug.

5 Blood concentration of sulfathiazole over 10 mg per hundred cubic centimeters is undesirable unless the aforementioned precautions are observed.

6 Sulfathiazole should be used only when definitely indicated and should not be continued longer than is absolutely necessary.

## ACTIVE IMMUNITY

PREVENTIONS AGAINST SMALLPOX, DIPHTHERIA,  
WHOOPING COUGH, TETANUS AND TYPHOID

JOHN A. TOOMEY, M.D.

CLEVELAND

The ultimate objective of both general practitioner and public health official is the same. The former must as far as possible bring about perfect protection of his individual patient, while the latter is satisfied with such immunity as will protect the greatest possible number with the least possible effort.

Most active immunizing principles have been described but few have stood the test of time. Perhaps the most successful have to do with smallpox, diphtheria, typhoid, tetanus and whooping cough. These will be described in detail.

A compilation of routine prophylactic procedures against infectious diseases may be found in the report of the Committee on Therapeutic Procedures for Acute Infectious Diseases and on Biologicals of the American Academy of Pediatrics and in the 1940 revised report of a Committee of the American Public Health Association on "The Control of Communicable Diseases" (reprint 1697, Public Health Reports 1940).

### SMALLPOX

*Diagnostic Test*—There is no diagnostic test. The specific neutralizing titer of the blood serum can be determined but this procedure is not practical.

*Active Immunity*—This is accomplished when a susceptible individual is successfully vaccinated with smallpox vaccine.

(a) What is the Vaccinating Material? Smallpox vaccine is obtained from calves.

The seed virus is planted in the abdominal skin of a calf, when ripe, the vaccine is found in the semisolid mass at the base of the lesions and in the surrounding serum exudate.

The vaccinated animal is killed immediately before the vaccine is harvested and a careful autopsy is done

to discover any disease. Freshly harvested vaccine is not sterile. It may contain many types of organisms, but most of these are easily controlled by putting the virus in glycerin. Some firms even add a dye, such as brilliant green. Smallpox vaccine is thoroughly tested to insure that it is free from tetanus spores and other pathogens.

Vaccine is extremely sensitive to temperature changes and it should not be kept in a warm room. It should be placed in the freezing compartment of a refrigerator or actually on ice at a temperature well below 40 F, the colder the better. When vaccine material is shipped, it should be packed in solidified carbon dioxide. It should never be used after the expiration date, which is stamped on the outside of each package. Vaccine is never sold in bulk but only in individual capillary tubes, which once broken, must be used immediately or discarded. The potency of vaccine from various commercial houses may differ.

(b) Who Should Be Vaccinated? Any one who never has had the disease, the individual successfully vaccinated previously who has lost his immunity, and all those recently exposed to smallpox should be vaccinated. When a susceptible person has been exposed to smallpox, it is best to vaccinate him at once with vaccine obtained from different lots if possible in three or four places about an inch apart. This is done in the hope he will develop enough immune antibodies either to ward off an attack of the disease or to modify its character.

(c) How to Release the Virus from the Capillary Tube. Thrust the capillary tube through the middle of the narrow end of the rubber bulb. Cover the exposed end of the tube with sterile gauze and break it off below the vaccine level. Then bend and break the end in the bulb. When the finger tip is placed over the opening of the bulb and pressure exerted, the contents of the capillary tube are evacuated.

(d) Methods of Inoculation. The skin is first gently cleansed with soap and water, dried, wiped clean with some solution like acetone, alcohol or alcohol combined with ether, and the area allowed to dry. Do not rub the skin. The vaccinated area should never be over  $\frac{1}{8}$  inch in diameter and should not be directly exposed to sunlight for a few hours after vaccination.

There have been many methods of inoculation described in the past, scarification, linear incision, the drill method, intradermal, subcutaneous, by threading and so on. The idea was merely to pierce the epidermis and to avoid drawing blood.

The U. S. Public Health Service recommends the multiple acupressure method (multiple pressure method). The left arm is grasped and the skin put on the stretch between the forefinger and the thumb of the left hand. A drop of vaccine material is placed on the skin, and a sharp pointed needle, placed tangential to the tightly stretched skin, is raised up and down quickly, the body of the needle always parallel to the arm, pressing down each time it reaches the taut skin. This makes a small prick in the epidermis. Ten to twenty pressures confined to an area  $\frac{1}{8}$  inch in diameter are enough to get a good take, thirty will usually result in a take even if the vaccine is less potent. All remaining vaccine should be wiped off at once with sterile gauze and the sleeve pulled down. Immediately after vaccination the area appears red. Within six hours all evidence of the punctures will have faded and there will

From the Division of Contagious Diseases, City Hospital, and the Department of Pediatrics, Western Reserve University School of Medicine. Owing to lack of space this article is abbreviated by omission of the literature to be studied. The complete article appears in the author's reprints.

be no evidence of bleeding. Shields and other dressings should never be used since they retain moisture and create conditions favorable to secondary infection.

(c) Place of Inoculation. The area over the insertion of the deltoid of the left arm is the best place to vaccinate.

One must be cautious when vaccinating an eczematous patient. In nonepidemic periods it might be well to wait until skin lesions are healed. During epidemics the patient should be vaccinated despite the eczema.

(f) Course of Vaccination. The results of vaccination are a full take, no take, a vaccinoid or accelerated reaction and a reaction of immunity.

If the vaccinated person has no take whatever the vaccine material has become inert and the procedure must be repeated. It does not indicate that the subject is immune but that the vaccine virus used is weak.

A primary vaccinia or take gradually passes through the stages of maculation, papulation, vesiculation and pustulation within three to nine days, with subsequent desiccation and scabbing followed by healing of the lesion by the twenty-first day. The first reaction is a macule. This type of lesion progresses so quickly into the papular lesion as to be sometimes missed. The papule enlarges for three to five days. There may be subjective sensations of burning and itching. By five to seven days a gray pearl colored vesicle appears which soon becomes umbilicated. About the seventh or eighth day the vesicle has become pustular, averaging  $\frac{1}{2}$  to  $\frac{3}{4}$  inch in diameter, surrounded by a red areola. The area about the lesion may itch intensely. The local glands are enlarged. Clinical symptoms now appear such as headache, backache, general malaise, a fever and a leukocytosis, which may last three to four days.

About the eleventh or twelfth day the pustule begins to dry and form a crust. The scab thus formed drops off somewhere between the twentieth and twenty-fifth day, leaving the exposed area red. This gradually changes to pink and then to a dead white appearance—all during the period of about six months to one year.

If a person has some but not sufficient antiviral immunity, he may develop an accelerated take or vaccinoid reaction which passes through the stages mentioned—maculation, papulation, vesiculation and pustulation, quickly, within four to seven days. Sometimes the lesion may not even get to the stage of pustulation. Occasionally the lesion may become hard, elevated and wine colored and subside slowly without going on to the stage of vesiculation.

Some persons successfully vaccinated may retain their immunity and, when revaccinated, will have what is termed a 'reaction to immunity' or an immediate or accelerated reaction of local redness and induration. This may be nothing more than redness and induration or perhaps a glassy vesicle, coming on usually within twenty-four to forty-eight hours after vaccination. This indicates that the person cannot be revaccinated and probably will not get the disease. Sometimes vesicles may appear within twelve hours after vaccination in these immune persons.

The vaccine may be so potent and the patient so lacking in immunity and susceptible to the vaccine that a positive take with a varioloid condition is produced with which one has all the symptoms and signs of mild smallpox. The lesions are typical if they go on to the stage of pustulation, but usually there is a tendency for these lesions to become hard vesicles and to be absorbed at this stage. They may, however, go on to the stage of pustulation. The symptoms will be

the same as those of a mild smallpox infection. This reaction is rare.

(n) Dangers of Vaccination. The chief danger is infection, such as crissipelas, other coccoid infections and tetanus. Postvaccinal encephalitis occurs rarely. The vaccinated individual should be instructed not to touch the lesion as virus may get on the finger tips and be spread by scratching. If the scab is disturbed the underlying lesion may develop a weeping surface. The area should be covered with sterile gauze. If infection occurs sulfonamide drugs are given internally. The latter drugs do not prevent a vaccination take.

(h) When to Vaccinate. It is best to vaccinate as soon after birth as possible, but not before the umbilical cord drops off. Few complications occur at this time; the procedure is well borne and the reactions are inconsequential. The lesion can be easily kept dry and cool and the chances for cross infection with tetanus germs and the like are minimal. To my knowledge no cases of postvaccinal encephalitis have been described during infancy. If the child is not vaccinated in infancy he should be vaccinated at least before the age of 3 and during the cold weather if possible. The Committee on Therapeutic Procedures for Acute Infectious Diseases and on Biologicals of the American Academy of Pediatrics recommends that the child should be vaccinated at any age during an epidemic but routinely at any time between 3 to 12 months. All children should be routinely revaccinated at 6 and 12 years of age. Every one should be vaccinated susceptible and previously successfully vaccinated persons alike immediately after exposure.

(i) Results of Immunization. Vaccination is probably one of the most successful of active artificial immunization procedures, but like all such procedures it may fail to protect. There may be failures because the vaccine is old because it has become attenuated by some physical factor, because it is actually impotent or because the vaccination has not been done properly. Occasional persons may even lose their immunity quickly.

(j) Duration of Protection. The duration of protection which follows a successful take is variable. Usually a good take will protect at least five to seven years. It may even protect for the whole lifetime of the individual. Since a certain percentage of vaccinated persons lose their immunity, it is best during the course of an epidemic to consider all persons as having lost their protection and to revaccinate all exposed persons despite previous successful vaccinations. The individual who has immunity will have a reaction of immunity and no discomfort other than a slight local induration which follows within twenty-four hours after vaccination, while the few who have lost their immunity may have an accelerated reaction or definite take.

#### DIPHTHERIA

*Diagnostic Test*—The Schick test is one of the most accurate of all biologic tests but like other biologic tests is not an infallible measure of immunity. To perform it, inject 0.1 cc of diluted diphtheria toxin intradermally (not subcutaneously) into the skin of the forearm. Some biologic manufacturers make up their material so that 0.2 cc is required for the test. Before proceeding, one should read the literature which accompanies each package of toxin to determine what the dose should be. The diluent is usually physiologic solution of sodium chloride. If properly administered, a small,

white raised wheal-like lesion will immediately appear at the site of injection.

From a public health point of view it is unnecessary to do Schick or control tests on young children before immunization, the tests will nearly all be positive anyway. In private practice, however, it may occasionally be desirable for some reason or other, it is thought best by some not to give another injection unless it is necessary.

Volk now believes that Schick testing as a routine procedure need not be encouraged because antitoxin levels change from time to time. He with Bunney now believe that, when a previously immunized child has been exposed to diphtheria and the status of immunity is unknown the child should be reimmunized with a dose of alum precipitated toxoid. Volk, however, does not rule out the use of the Schick test occasionally to determine immunity.

The test should be read ten or five days after injection. Pseudoinflammatory reactions which appear twelve to forty-eight hours after the injection can be ignored. An area of redness or brownness with desquamation 0.5 cm. or larger in diameter indicates that the test is positive. The size of the reaction is no absolute indication of the amount of antitoxin possessed by the tested individual. An infant may acquire some passive immunity from the mother. Hence he may be a negative reactor for six to eight months after birth. Such immunity is usually lost within the year after birth.

Older children and adults should have a Schick test before being immunized. Many individuals may be sensitized to the materials in which the diphtheria organisms grow and they will have an apparent persistently positive Schick test. A control test becomes necessary to detect such a condition.

To do this, heat the same Schick toxin solution used for the test to 70 to 80 C (158 to 176 F) for ten minutes and inject comparable amounts (0.1 or 0.2 cc., as the case may be) intradermally into the opposite forearm. The bilateral reactions should be comparable if the patient has become sensitized. If both sides respond, but the side getting the Schick material has a larger reaction it is questionable whether the patient is sensitized or immunized.

One-tenth cc. of a 1:20 dilution of toxoid is sometimes used as the control in the Schick test instead of the heated toxin (Moloney reaction). Heated toxin, however, is a better control mixture for the Schick test.

There is only one way inferentially to determine susceptibility, i. e. by testing the blood serum for its antitoxin content. This procedure is too difficult and impractical.

**Active Immunity**—One cannot give all the credit for the recent drop in the diphtheria morbidity rate to active immunization, for a decline in morbidity and mortality rates has occurred in American cities where no programs of immunization have been in progress. Even the decrease in cities which have employed active immunization is much beyond that which might have been expected with any such program of protection. Despite these facts we know that animals can be protected by vaccination against diphtheria and the susceptible human being rendered Schick negative. We know that most persons acquire immunity as they grow older and if we can keep the majority of the childhood population immunized the disease will be controlled (See U. S. P. H. S. opinion later).

(a) **Place of Inoculation** The injection is usually made in the deltoid or triceps area of the arm or in the back between the shoulder blades, but it could be made anywhere. All injections are given subcutaneously.

Diphtheria toxoid has also been injected intradermally. I have compared the differences in reactions between intradermal injections of alum precipitated and the plain fluid toxoids in children in an orphan home and in nurses at Cleveland City Hospital. There are local reactions about both injections, but they are definitely greater about the fluid toxoid. Intradermal immunization is not recommended because it is not always easy to do, and it has no decided advantage over the much easier subcutaneous method of injection.

(b) **Immunization Materials** Three materials are prepared commercially to produce active immunity, they are toxin antitoxin, toxoid and alum precipitated toxoid.

The toxoids are very stable. Aging does not cause them to deteriorate much, freezing does not destroy them, even heat affects them but little. Unlike toxin antitoxin, they never revert and become toxic again.

The present tendency in private practice is to learn how to use one type of material for everybody.

All of these immunizing agents come in vials and before using the stopper is cleaned with alcohol or alcohol ether or acetone, the plunger of a syringe is withdrawn up to the 0.5 or 1 cc. mark, as the dose may be, the needle is thrust through the rubber stopper, the barrel is slowly plunged to the hilt, and the air is expelled into the vial. The fluid is sucked into the syringe to the proper marking desired. The vial is then drawn away from the needle and the syringe barrel is tapped lightly to get rid of air bubbles.

(NOTE—This preliminary procedure is common for all preparations held in vials or bottles with rubber caps. Alum precipitated toxoid preparations must be shaken before use.)

1 **Toxin antitoxin** This is toxin underneutralized by horse, goat or sheep antitoxin. It has been recommended for persons over 10 years of age.

This antigen is a clear fluid. Reject cloudy fluid. Injections are given subcutaneously in doses of 0.5 cc., 1 cc. and 1 cc. at two to four week intervals. The objections to its use are (a) Immunity is produced too slowly, since a year may elapse before the Schick test will become reversed, (b) the individual injected may become sensitized to animal serums.

2 **Diphtheria toxoid (plain toxoid, Ramon's Antitoxine)** This is recommended for children under 10 years of age. It is a clear fluid. Reject cloudy fluid. It is injected subcutaneously in doses of 0.5 cc., 1 cc. and 1 cc. at intervals of at least two weeks. The tendency is to prolong the time interval between doses about one month so that a physician need not be concerned about a strict time interval. Serum sensitization will not occur after these injections.

Adults may be susceptible to the diphtheria bacillus protein. When either toxoid or alum precipitated toxoid is used, it may be advisable to inject 0.1 cc. of the toxoid material intradermally. This indicates the amount of hypersensitivity (Moloney reaction). My practice has been to inject 0.1-0.2 cc. subcutaneously and to consider this as part of the immunization procedure. The amount of reaction determines the amount injected subsequently.

3 **Alum precipitated toxoid** This preparation is gradually supplanting all other diphtheria immunizing

agents. It is more slowly absorbed, more slowly excreted and effects immunization more promptly. It is a milky white substance. The Committee on Therapeutic Procedures for Acute Infectious Diseases and on Biologicals of the American Academy of Pediatrics recommends three doses, 0.5, 1 and 1 cc., to be given subcutaneously at intervals of two to four weeks, although the time interval between doses may be preferably longer, i. e. from two or more months.

To avoid reactions in nurses, doctors and other persons to whom antitoxin has been recommended. It is this very group, however, that occasionally has reactions following the injection of this biologic preparation. It is questionable whether these persons should be immunized thus and possibly sensitized to animal serums. They are the very ones who are continuously exposed to infectious diseases, which require therapeutic treatment with horse serum products and it is most important not to sensitize them. I myself believe that alum precipitated toxoid will supplant the use of both toxoid and toxin antitoxin even for this group. For the past four years I have used it to immunize all of our nurses (City Hospital Cleveland).

The number of injections is important from a practical point of view.

It has been demonstrated that the amount of antigen necessary varies with communities and is probably correlated with the prevalence of diphtheria bacillus infection.

The final conclusions of Volk and Bunney in their recent study for the A. P. H. A. was that the most effective immunizing procedure was two doses of alum precipitated toxoid, their second choice was three injections of fluid toxoid.

It is the opinion of clinicians that one dose of alum precipitated toxoid is not sufficient to immunize a person. It is also their opinion that, although two doses might immunize most persons, three doses would probably be best for more complete protection.

4. Reactions. Each of the three materials may cause reactions. Toxin antitoxin causes few or none in children and some in adults. Toxoid and the alum precipitated toxoid cause local as well as general reactions in both children and adults. The severity is relatively less in children. It is unusual in my experience not to have at least a slight local reaction, such as a faint pink lesion, deep red erythema, some deep induration, nodular formation or a brawny swelling of the arm around the area injected. Any one of these local reactions may be accompanied by all the signs of inflammation—local pain, heat and so on. There may be general reactions also, such as fever, headache, malaise or occasionally some prostration. Urticaria and local allergic responses have been described.

The toxoids always cause some local and often general reactions in an adult. The adult may have some immunity, and less of the toxoid product need be given. One can begin by injecting 0.1 cc. subcutaneously to determine the type of reaction to expect and then 0.2 cc. and 0.5 cc. at intervals of two to four weeks to two months apart. An additional 1 cc. is given a few months later if the reactions have not been too severe.

Within four or five hours after an injection of toxoid, a local reaction may be apparent. The reactions after toxin antitoxin, when present, are about the same as after toxoid. Within twelve to twenty-four hours any

reaction is usually at its height and the fever, malaise, and so on are then most prominent. The localized reaction begins to recede within twenty-four hours, and by forty-eight hours, although the area may still be painful to touch or manipulation, the greater part of the inflammatory response has receded and the generalized reaction has disappeared. It may take a week, however, for the local induration to subside completely and to absorb. In fact, the antigen remains in the body long enough to act as an autostimulus. Occasionally a small nodule is formed at the site of injection and it may be months before this is completely gone. Sometimes a sterile abscess will follow.

(c) Result of Immunization. The Subcommittee of Evaluation of Administrative Practices of the American Public Health Association does not feel that as a public health measure a test is necessary after the routine inoculation of children in infancy although it may be desirable in private practice and under some other conditions of contact exposure. The private practitioner will want to do a Schick test within six months after immunization has been completed. (See opinion of Volk and Bunney stated subsequently.) The patient should be reimmunized if found to be positive.

(d) Age When Injected. It is preferable not to immunize before 9 months of age and not to inject routinely after 10 years of age without some good reason.

One should routinely immunize adults only if they belong to a group which will be definitely and intimately exposed to this infection such as doctors, nurses or teachers. Persons in this group should never be immunized unless first tested and the Schick test found to be positive. Most adults, especially if living in an area of prevalent infection, immunize themselves by subclinical attacks and by the time they reach adult life, they may have become negative reactors to the Schick test.

(e) Duration of Protection. Reports vary. Some say that protection lasts as short as five or six years and as long as ten years after immunization with toxin antitoxin and that about 70 per cent are immunized after three injections.

The toxoids have been introduced too recently to have afforded accurate long term statistics, but the trend is toward the sole use of alum precipitated toxoid.

Two doses of toxoid are said to be 20 to 30 per cent more effective than three of toxin antitoxin. It is stated that about 70 to 90 per cent of those vaccinated will be immunized as soon as two months after two doses of toxoid, but that one third will have lost their immunity within five years.

The alum precipitated toxoid introduced by Glenny and his co-workers and reported in this country in 1933 by Havens and Wells was carefully studied by Volk and Bunney. Volk demonstrated that after one injection there were some 83 to 86 per cent Schick test reversals, depending on the number of 1/2 alum precipitated units injected. It is believed that the increased antigenic efficiency of the alum precipitated toxoid is due to the fact that the molecules are held in the subcutaneous tissue for a long period of time and absorption is slow, as evidenced by the persistence of the nodular masses mentioned previously.

Bundesen, Fishbein and White state that at least 94.9 per cent were Schick negative two years after injection, although only 43.4 per cent of the persons immunized had more than 1/2 unit of antitoxin.

From a public health point of view a single dose of alum precipitated toxoid is preferred to two doses of toxoid or toxin antitoxin. It may be advisable to give another injection of the toxoid just before the child enters school. The reinforcing dose given at school age is recommended to be half the size of the initial dose. This is enough to provide the secondary antigenic stimulation. In private practice it is advisable to repeat the Schick test at 6 and 12 years of age or at the age coinciding with the age group getting clinical diphtheria in that particular community. The United States Public Health Service has directed my attention to the fact that the persistence of Schick negativity is due less to the original antigen than to previous and subsequent experience of an individual with the diphtheria bacillus. They call attention to the fact that one dose of alum precipitated toxoid is at present sufficient for 85 to 95 per cent in Alabama (where carrier prevalence is high), while two doses are necessary in Michigan where the prevalence is low. In addition, children in Michigan need a stimulating dose at about school age.

(1) *Place of Remuculation*—If remuculation is necessary, one should give the vaccine at some place other than where injections were made previously. I have noticed that too many injections of active immune products at any one point cause severe local reactions.

*Lifelines*—Exposed persons may be passively immunized with 1000 units of antitoxin. This passive immunity lasts from ten days to several weeks. It is unnecessary to inject exposees unless the physician practices in an inaccessible place. Should a person get diphtheria, the children in the family should be observed closely. Many of them will not get the disease anyway and do not need passive protection, if they do get the disease, it is seen early enough and can be aborted quickly by the use of antitoxin. Some advise passive protection of children under 3 years of age on the belief that adequate examination of infants is difficult. If one wishes to immunize a child actively after injecting antitoxin, some time should elapse before the injections are given. There are reports, however, where simultaneous administration of prophylactic antitoxin and toxoid were followed by Schick negativity.

If the patient contracts diphtheria during the course of active immunization, he should be treated with antitoxin.

As mentioned previously, in country practice one may wish to give the exposee 1000 or 2,000 units of antitoxin intramuscularly. Never inject the antitoxin subcutaneously; the area about the injection may later become painfully indurated. In some instances the area around the site of injection may become brawny and indurated and a modified Arthus phenomenon observed with local sloughing of the tissues.

*Multiple Vaccination*—Diphtheria toxoid or alum precipitated toxoid has been combined with (a) alum precipitated whooping cough bacilli or (b) tetanus toxoid or alum precipitated tetanus toxoid. Neither of these combinations is said to interfere with the production of diphtheria immunity.

One commercial firm combines an alum precipitated vaccine (*Hemophilus pertussis* bacillus) containing 40 billion killed organisms per cubic centimeter with alum precipitated diphtheria toxoid standardized at 40 Lf units per cubic centimeter and advises the injection of three doses of this combined vaccine subcutaneously in amounts of 0.2, 0.3 and 0.5 cc.

Another firm has standardized this mixed vaccine at 10 billion organisms per cubic centimeter and advises the physician to give 1 cc of the combined mixtures at intervals of one to two months for three to four doses. There are the usual reactions after these injections. The evidence seems promising, but it cannot be finally evaluated at the moment and hence cannot be recommended for routine use.

(a) *Alum Precipitated Diphtheria and Tetanus Toxoids*—The respective toxoids have been combined and used in immunization. They are injected in the same manner (subcutaneously) as are other toxoids. One cc of the combined mixture is given and, about a month later, another dose of 1 cc.

These doses are not fixed entities, the amount is variable. Some persons, especially adults, are sensitive to the diphtheria bacillus protein. Here, as with diphtheria alum precipitated toxoid, 0.2 cc may be injected subcutaneously and the reactions observed (Moloney reaction). If no severe reaction is noted, 0.3 cc and 0.5 cc at intervals of two weeks may be injected and then 1 cc about three months later. If there are severe reactions, smaller amounts may be used—perhaps 0.2 cc at intervals of two weeks until 1 cc is given.

If the immunized susceptible person subsequently receives a deep and contaminated wound, especially about the face, or an extensive wound of the body, a stimulating dose of 0.5 cc of tetanus alum precipitated toxoid must be given. (See Tetanus.)

The reactions are the same as those seen after toxoid injection. These may be an occasional rash, urticaria, or the like. According to Cooke and his co-workers some reactions are allergic in character. They do not seem too important, especially since Peshkin and his co-workers were able to immunize 186 allergic children with two doses of 0.5 cc each of the combined toxoids with excellent results and no severe reactions.

The reports in the literature seem promising, but the U. S. P. H. S. does not approve of the use of combined tetanus and diphtheria toxoids at the present time.

#### PERTUSSIS, OR WHOOPING COUGH

*Diagnostic Test*—Many cutaneous tests have been described, none of which have any proved value.

*Active Immunity*—There are several biologic preparations used to immunize. They are (1) Sauer's vaccine, (2) old fashioned vaccine, (3) Krueger's endoantigen, (4) Topagen, (5) pertussis detoxified antigen and (6) Bell's alum precipitated whooping cough toxoid.

In general, do not inject any of the vaccines into a blood vessel or in areas previously inoculated with toxoid or smallpox vaccine. Do not use frozen vaccine, but keep in a refrigerator at 2 to 10 C.

When the vaccine is contained in vials, go through the preliminary step as described under diphtheria. Stoppers should never be removed, as the vaccine may become contaminated.

(a) *Immunization Materials*—1 Sauer's vaccine (*H. pertussis* organisms grown on human blood agar). This is standardized at 10 billion organisms per cubic centimeter. Eight to 10 cc (80 billion or more organisms) is the total dose injected, 1 cc being injected subcutaneously in the deltoid area of each arm, 0.5 to 2 cc in the biceps area of each arm, and 1.5 to 2 cc in the triceps area of each arm at weekly intervals. Do not inject the same arm twice. Recently Sauer intro-

duced a double strength vaccine standardized at 20 billion organisms per cubic centimeter. The injections consist of three single doses of 1, 2 and 2 cc weekly in two deltoid and one triceps areas.

If the reactions are severe after any injection, decrease the amount given with each succeeding dose and increase the number of injections.

TABLE 1—*Dosage Schedule*

| H. Pertussis<br>Bacillus per Cc | 10 Billion  | 20 Billion                       |
|---------------------------------|---|----------------------------------|
| Dose 1                          | 1 cc upper deltoid<br>left arm<br>1 cc upper deltoid<br>right arm       | 1 cc deltoid region<br>left arm  |
| Dose 2                          | 1 cc biceps region<br>left arm<br>1 cc biceps region<br>right arm       | 2 cc deltoid region<br>right arm |
| Dose 3                          | 1.5 cc triceps region<br>left arm<br>1.5 cc triceps region<br>right arm | 2 cc triceps region<br>left arm  |

2. Old fashioned vaccine (H. pertussis of questionable phase characteristics). This is injected weekly in doses of 1 cc each four to five times.

3. Krueger's endoantigen. This is the clear extract obtained after subjecting the organisms to ball mill grinding. One cc is injected and then 1.5 to 2 cc every other day for six doses. All injections are made subcutaneously. During epidemic periods 2 to 3 cc may be given subcutaneously once weekly for four weeks.

4. Topagen is somewhat similar to Krueger's endoantigen, the endoantigen being chemically separated. This material is put up in a vial. The physician is advised to drop the fluid into the nostril with an eye dropper two or three times daily for a few weeks.

5. Pertussis detoxified antigen utilizes the products of bacterial metabolism and not the bacteria itself. One cc of this material may be given for three doses at intervals of two or three weeks. The inoculations are made subcutaneously in the biceps area of the arm.

6. Alum precipitated whooping cough toxoid contains 10 billion organisms per cubic centimeter. Two doses of 1 cc are given about a month apart. This is not on the market as yet.

(b) Clinical Course of Vaccination. Local and general reactions may follow injections of Sauer's vaccine. The severity depends somewhat on the age. The younger the person the less apt will be the occurrence of reactions. The local ones are redness, induration, pain and swelling. Occasionally there may be slight adenitis.

General reactions such as fever and malaise may occur, but they are not ordinarily severe. Death has been referred to. It is questionable in my mind whether this vaccine has ever caused a fatality. A few patients have had convulsions.

Fewer reactions follow the injection of Krueger's endoantigen and the old fashioned vaccine. Sneezing may follow the local application of topagen.

Pertussis detoxified antigen does not usually cause reactions, but it may. When these occur, they are similar to those seen after Sauer's vaccine.

The local reactions come on shortly after injection, i. e. within six to twenty-four hours. Usually by the end of twenty-four hours these as well as the general reactions, have begun to subside, although the area of inoculation may be indurated for a few weeks.

(c) Results of Vaccination. This has been the subject of debate. Sauer's vaccine is not so effective as is diphtheria toxoid, although no active immune procedure is 100 per cent efficient. It may not prevent the disease in every vaccinated person but there is evidence to show that if the attacks should occur after vaccination they are much milder in character. Both the Committee on Therapeutic Procedures for Acute Infections Diseases and on Biologicals of the American Academy of Pediatrics and that of the American Public Health Association feel that from a public health standpoint this vaccine is still in the experimental stage, although the members of the academy group favor the use of Sauer's vaccine in private practice.

A compilation of the results on Sauer's vaccine appearing in the literature has been made by Wickoff.

These reports, together with the recent experiences of Perkins et al. in Binghamton, N. Y., and despite the adverse findings of Doull, seem to confirm the experience of Kendrick et al., Sauer, Miller and Faber, Mishulow and others. The percentage of established protection in the Binghamton experiment was not so high as in the other reported series. Faber and Miller believe that the percentage of success following the use of vaccine is high enough to include it in the routine program of immunization for infants and young children.

There is no evidence that either Krueger's endoantigen or Topagen is of any proved value. The old fashioned vaccine apparently gave some results in the past (Huenekens). Pertussis detoxified antigen is still being used experimentally. It is said that the immunity lasts from five months to two and one-half years. One author claims 81 per cent protection in 183 exposed. Bell believes that two injections of alum precipitated whooping cough toxoid give as good results as those which follow the injection of Sauer's vaccine.

(d) Where and When Injected. Injections are made subcutaneously. Intradermal injections were tried, but they were discontinued because of severe reactions and the many number of injections necessary. Intranasal injections are of questionable importance at the moment. The vaccine may be injected from two to four weeks apart.

TABLE 2—*Results Appearing in Literature*

| Author            | Year | Dose 1000<br>M per Cc | Test Group |          |                  | Control Group |        |          |                  |

| Singer Brooks     | 1939 | 80                    | 272        | 42       | 16               | 256           | 71     | 62       | 87               |
| Doull and others  | 1936 | 80                    | 42         | 61       | 496              | 71            | 71     | 22       | 46               |
| Selgel and others | 1937 | 80                    | 101        | 17       | 9                | 52            | 110    | 47       | 22               |
| MacLean           | 1939 | 16-20                 | 513        | 46       | 0                | 0             | 134    | 115      | 89               |

(e) Duration of Protection. It has been stated that it probably takes four or five months for immunity to develop after injection of Sauer's vaccine. The actual duration of protection is not known definitely although clinical experience of the many workers indicates that this may be at least two years. It is not settled whether it might not be a wise procedure to give a stimulating dose each year after active immunization is complete.

(f) Age of Vaccination. I have seen infants who had contracted whooping cough as early as ten days after birth, yet the total number of cases in the first

six months of life is relatively low and some passive immunity may be present. For this reason it is considered best to vaccinate against pertussis between the ages of 6 and 9 months. Reactions are also less apt to occur at this age.

*Exposures*—Exposures may be given any of the material mentioned under Active Immunity. The results are questionable.

Ten to 20 cc of convalescent serum may be injected intramuscularly. It likewise is of doubtful value.

Ten to 15 cc of hyperimmune serum, i. e. serum of persons who have had whooping cough and who have been repeatedly inoculated with whooping cough vaccine over some period of time, may be injected intramuscularly, especially in infants. The laboratory reports are favorable, and the clinical reports appear to be promising.

*Mixed Vaccines*—See under Diphtheria.

*Addenda*—It may be mentioned that there are those who believe that the matter of whooping cough prevention has not been completely settled. Toxins have been described, whether they are exotoxins or endotoxins is a moot point. A sticky exudate is referred to the exudate which produces the cough in this disease. It has been thought that the bacteria initiate the disease, that the toxins sensitize the patient and cause the typical lymphocytosis and that acquired immunity is formed against the sticky exudate. None of these beliefs, however, have reached the stage of acceptance.

All we know at present is that the bacteria actually initiate the disease and that all the printed evidence favors the use of H. pertussis in the "disease producing" phase of its existence (phase I) or its alum precipitated toxoid to produce active immunity.

#### TYPHOID

*Diagnostic Test*—There is no diagnostic test that determines susceptibility to typhoid. The Widal test is a laboratory test and is found positive only some time after a susceptible person has become infected.

*Active Immunity*—The vaccine has been tried on a large scale in military circles. Its efficiency was demonstrated during the first world war and its continued use justified.

It is unnecessary to vaccinate persons living in large cities where the water supply and sanitary conditions are very good. It should be used for individuals usually above 2 years of age living in those localities where typhoid is endemic, where the water supply is unpurified and the sewerage system primitive, for travelers, for members of the patient's family, for institutional personnel and for persons living in an epidemic area and for the military forces.

Vaccine comes in packages of three vials for individual requirements and also in bulk. It should be shaken before withdrawal.

The usual preliminary procedure should be followed in withdrawing the vaccine from the vials. (See Diphtheria.) Small doses have been recommended for children. This is not felt to be practical, since the child can endure a larger dose than the adult. If the reaction is extremely severe after the first injection, the individual dose should be decreased and the total number of injections increased. The antigen should never be injected in the same area in which other antigens have been recently injected. It is wise to vaccinate only healthy people and in the evening, occasionally it has

been recommended to avoid vaccinating females during the menstrual period.

The antigen vaccines are killed typhoid organisms. These are injected subcutaneously in 0.5, 1 and 1 cc doses every two to four weeks, the doses containing one-half, one and one billion organisms, respectively.

Protection may last a long time, but in many instances it is lost within a year or two and some believe that one reinjection should be made each year in the spring time or at least every two years. It should be stated that reinoculations may be followed by reactions. The amounts recommended for reinoculation have ranged from 0.1 cc to 1.0 cc.

(a) *Site of Injection*—It is recommended that all injections be given subcutaneously. They have also been given intradermally, but the efficacy of this method has not been evaluated. The vaccine has been given by mouth in capsules. Although agglutinins may be produced in the test animals and protection develops against enteric organisms, the agglutinins are never so high as after parenteral injections.

(b) *Clinical Course of Vaccination*—This depends on the type of vaccinating material and the concentration of the injection. Recruits in the first world war were often inoculated with one injection of triple typhoid vaccine in oil which contained the number of organisms present in all three ordinary injections. The reactions, both local and general, were severe. Even after enteric ingestion of capsules of enteric organisms, there may be nausea, some distress, some abdominal pain and fever.

After the subcutaneous injection there will be some local reaction—redness, fever and induration. This comes on within two to twenty-four hours. Nodulation may form or the arm may become intensely swollen and indurated and all the signs of inflammation may appear. In addition there may be severe malaise, backache, general muscle pain and weakness. However, these reactions are not the common ones and, when they do occur, they do not last longer than thirty-six to forty-eight hours after the injection. After inserting the hypodermic needle subcutaneously, one must always withdraw the plunger before injecting the antigen. If there is blood present, the needle must be withdrawn and the injection made elsewhere. Should the vaccine be injected into the blood stream, the patient may have a violent chill from twenty minutes to a few hours after. This may last approximately twenty minutes and the temperature may go up to 106 F. Do not give such patients hydrotherapy for the temperature, but cover them with blankets and surround them with hot water bottles. Occasionally one of these patients may become unconscious, but this occurrence is rare.

*Mixed Vaccines*—Typhoid vaccine is sometimes combined with paratyphoid A and paratyphoid B organisms. They are used extensively. One cc of the vaccine contains one billion *Eberthella typhosa* organisms, one-half billion each of paratyphoid A and B (one biologic house has three-fourths billion each of the latter). The doses are the same as for typhoid, 0.5, 1 and 1 cc given every seven to ten days for three injections. The methods of administration and preparation are the same as those for typhoid vaccine. The reactions are usually more severe and are similar to those following typhoid inoculation. This combination of three organisms causes the same local and general reactions as does the vaccine containing only typhoid vaccine. Within the past few months the Army has started again to use the triple vaccine routinely.

*Exposures*—One may inject typhoid vaccines immediately after known exposures, although even a high agglutinin titer produced by the vaccine at this time may not abort the disease in the well exposed individual

#### TETANUS

*Diagnostic Test*—There is no biologic test for tetanus

*Active Immunity*—Tetanus toxoid is injected subcutaneously in doses of 0.5, 1 and 1 cc every four weeks or at longer intervals of two months

(a) *Clinical Course* The reactions are fairly mild in character, consisting of some redness and soreness about the injection. Occasionally a severe local inflammatory and general response may occur, and the whole arm may become swollen and the patient may have general malaise. All these reactions begin to subside within twenty-four to forty-eight hours. A small nodule may appear under the skin and persist for months. An occasional individual may be sensitized to tetanus and diphtheria toxoid, but this is easily recognized by cutaneous tests

(b) *Site of Injection* All injections are made subcutaneously. Intradermal vaccination against diphtheria or tetanus has some disadvantages and no evident superior advantages over conventional measures

(c) *Results of Inoculation* Tetanus toxoid was introduced so recently that it is impossible to say how long immunity will last, but the unanimous opinion is that it does immunize

(d) *Reinoculation* The protective antibody content of the blood serum possessed by the patient decreases as time goes on. For this reason, a second immunization of 0.5-1.0 cc should be given one year later (Leake). Persons who have been previously vaccinated with tetanus toxoid and who are subsequently wounded so that there is real danger of tetanus infection must get another "stimulating" dose of 0.5-1 cc of tetanus toxoid. This takes the place of the usual antitoxin injection. Because this toxoid might sensitize an occasional individual, it is advisable to make a cutaneous test before injecting the stimulating dose

(e) *The Age of the Patient* The patient should be vaccinated in early childhood when the local and general responses will be minimal and when the danger of tetanus first occurs, i. e. approximately between the ages of 9 months and 3 years. Reinoculation depends on reexposure and occurs at any age

*Exposures*—Persons who have received contaminated wounds and who have not been vaccinated within a month previously should receive from 1,000 to 2,000 units of tetanus antitoxin intramuscularly. This may not always prevent the disease if the lesion has been near the head or if the injury and exposure are massive. In these patients the dose should be repeated in seven to ten days. Most practitioners inject a combination of tetanus and gas gangrene antitoxin. The person who has been previously actively immunized and is injured is treated as in paragraph d

*Special Precautions*—Most physicians who have had some experience in the prophylaxis of tetanus feel that, more important than anything else, even more important than the use of antitoxin, is the physical, free removal of all foreign matter as early as possible by wide incision and excision and an early evacuation of the foreign matter under anesthesia if necessary. Some of the older practitioners (Abt) state that they would rather have such a procedure followed than to have antitoxin

## Clinical Notes, Suggestions and New Instruments

### INFANTILE TYPHOID WITH CONVULSIONS

MERRICK R. BRECK, M.D.  
Captain M. C. U. S. Army  
A. D.

JOSEPH MOSSBERGER, M.D.  
First Lieutenant M. C. U. S. Army  
Camp Barkeley, Texas

Because of the infrequent reports of typhoid in infants and its relatively low mortality rate, we are reporting this case, which terminated in death twenty-nine hours after the onset of symptoms. The severe neurologic manifestations throughout the short clinical course so camouflaged the true condition that, without findings of a postmortem examination, correct diagnosis may not have even been guessed.

Fatal infantile typhoid is rare at the present time. Of 30,000 admissions to the Bellevue Hospital, New York City, covering a period of fifteen years up to 1940, 1 case of typhoid fever was recognized under the age of 2 years.<sup>1</sup> Recent reports indicate that approximately 2 per cent of typhoid cases are in infants<sup>2</sup> and that out of this group a negligible percentage is fatal as compared to a reported 12.5 per cent mortality a few years ago.<sup>3</sup>

Typhoid is essentially a disease or injury of the lymphogenous and hematogenous organs produced by the blood borne *Eberthella typhosa*. Accumulation in the typhoid lesions of large, pale mononuclear cells with strong phagocytic activity has been a constant histologic finding. Whether these are endothelial cells, wandering macrophages or specialized mononuclears produced by the body in response to a specialized stimulus is a question not yet answered.<sup>4</sup> The mechanism by which the organism produces the disease is likewise a much controverted subject. Possibly the virus—V<sub>1</sub> antigen—associated with *Eberthella typhosa* is responsible for the virulence accredited to the organism itself. Apparently this thermolabile filtrable substance, when injected intracerebrally into the rabbit, is capable of producing typhoid with severe terminal diarrhea. This same virus also appears capable of stimulating the common intestinal saprophytes to a degree of pathogenicity.<sup>5</sup>

The pathway of the organism from the mouth to the blood stream is briefly thus:

1. Passage through the upper part of the gastrointestinal tract in food or drink contaminated with feces from a typhoid patient or a healthy carrier
2. Invasion of lymphoid tissue of the small bowel
3. Transport of the bacilli to the regional mesenteric lymph nodes draining the small intestine
4. Multiplication of the bacilli in these nodes
5. Passage up the thoracic duct
6. Liberation of the organisms into the venous blood of the left innominate vein<sup>6</sup>

#### REPORT OF CASE

*Illness*—E. M., a boy aged 21 months, ate his supper Aug. 16, 1941 and played with other children until 8 o'clock. At this time he began hiccuping, fell to the floor unconscious and rolled his eyes directly upward, where they "set" for approximately one minute. The parents gave him a warm enema and plunged him into a tub of hot water—acts which apparently terminated the first attack. An hour later the baby was attacked in a similar manner, having acted normally in the meantime. The

third attack, seen by the physician at 10 30 p m, resulted in bilateral convulsions of all extremities and stopped spontaneously after approximately thirty seconds. At 1 a m the patient had a convulsion involving the entire left side. After one minute the left side became semiflaccid, and the convulsion became a persistent right-sided one.

*History*—Inquiry into the baby's family history revealed that two cousins were interned in an institution for the epileptic. The mother and grandmother admitted having occasional "fits." A sister had died in infancy of "acute colitis." The mother stated that the child had been passing "worms", but her description of these was hazy and colored with a great deal of imagination. The baby had been well until the present sudden illness.

*Examination*—The boy was well nourished and developed. The right eyelids, right facial muscles, right side of the tongue, right thoracic and abdominal muscles, right cremasteric muscle and right extremities were in clonic convulsions occurring regularly at the rate of 60 per minute. The left extremities were flaccid. The skin was moist clammy and remarkably pale with beads of cold perspiration covering the forehead and neck. The eyes were open. Nystagmus movements were seen to accompany each convulsion the slow movement of the eyeballs carrying the pupils from midposition to the upper left quadrant of the orbits, thence a rapid movement bringing them back to midposition. In addition to the right eyelid convulsions, both lids blinked at approximately normal intervals. Both pupils were regular, dilated—the left larger than the right—and showed no reaction to light. The tympanic membranes were shiny and normal in appearance. The tonsils and pharynx showed no evidence of inflammation.

The heart rate was 180 and regular. The breathing was rapid but not particularly labored. The temperature was 101 F. Auscultation and percussion of the chest revealed nothing of significance. The blood pressure was 150 systolic and 60 diastolic.

The abdomen, somewhat generally distended and tympanic, showed a puffing out of the right midabdominal region. Peristalsis was at no time observed. All the deep reflexes were exaggerated on the right side.

*Course*—At 3 a m the patient was removed to the hospital. Fluoroscopy revealed no foreign body in the trachea, however, it did show a great deal of gas throughout the abdomen. Blood count at this time revealed white blood cells 10,000, red blood cells 4,500,000, blood calcium 10.1 mg per hundred cubic centimeters. The stool showed 4 plus blood and pus but no ova or parasites. Medium was inoculated for the culture of *Eberthella typhosa* and dysentery bacilli.

At 5 a m the white blood count was 6,000 with 28 per cent lymphocytes and 5 per cent mononuclears. Stool examination revealed a great quantity of blood, pus and mucus. The child at this time seemed exhausted. The convulsions continued. There was a spontaneous semiliquid bowel movement.

At 3 p m a spinal puncture was done. The pressure, although not measured, was evidently greater than normal. The cell count was 1 lymphocyte and 2 neutrophils per cubic millimeter. (Culture of spinal fluid showed no growth after three days' incubation.) The sedatives and fluids administered up to this time had apparently little effect. Blood was taken for the Widal examination. (This proved negative.)

At 5 p m August 17 the convulsions ceased, only to begin at 8 o'clock on the left side. The right pupil became larger than the left and the clonic convulsions shifted to the left side with involvement of the same corresponding sets of muscles. The right extremities became flaccid with a complete shift of the neurologic signs from the right to the left. The neck became moderately rigid, the temperature advanced to 107 F. The heart rate increased to 230. The baby became cyanotic and died at 1 45 a m.

*Autopsy*—The mucosa of the entire sigmoid region was seen to be dotted with minute ulcers, each with a yellow center and a red periphery. The largest of these ulcers was  $\frac{1}{3}$  cm in diameter. This area of ulceration and inflammation ended rather abruptly at the upper limit of the sigmoid. The trans-

verse and ascending colon appeared normal. The mesentery was studded with innumerable large purplish lymph nodes, some of which were 2 cm in length. These were larger and more numerous adjacent to the sigmoid and distal part of the ileum.

The lumen of the distal ileum was filled with blood. Its mucosa was remarkably injected and showed longitudinal, raised oval elevations. These elevations—apparently Peyer's patches—were highly inflamed but not ulcerated. In addition to these patches there were small ulcerations similar to those observed in the sigmoid. This ileitis extended 3 feet above the ileocecal junction. Except for a tense splenic capsule, no other gross pathologic condition was encountered in the thorax or the abdomen.

Gross examination of the cranial contents showed the cerebral gyri to be flattened and the sulci between them narrowed. The brain was pallid and on multiple section gave the appearance of mild edema.

*Bacteriologic Examination*—With sterile precautions, fluid was aspirated from the cisterna magna before the autopsy was begun. A small vessel was punctured in the process with resultant contamination of the fluid with blood. Culture of this material on blood agar, cosin-methylene blue and desoxycholate mediums produced numerous round, small, translucent colonies which on gram stain showed slender gram-negative bacilli. On bismuth sulfite medium the colonies were black. These bacilli were highly motile, produced no acid or gas in lactose mediums and agglutinated with Eberthella antiserum diluted to 1:16,000. Autoagglutination or agglutination with Salmonella and Shigella antisera was not observed.

*Microscopic Examination*—Nothing significant could be demonstrated in the spleen or liver. The mucosa of the sigmoid and ileum showed the surface necrosis in the ulcerated areas. The mesenteric lymph nodes and Peyer's patches contained large, pale staining mononuclears in their sinuses. It was noted also that the germinal centers of Peyer's patches were packed with these cells, many of which appeared to be making their way through the germinal center wall of lymphocytes to the cortical lymph sinuses. Some of these large mononuclears had ingested lymphocytes. Typhoid bacilli could not be demonstrated in the lesions. The cerebrum showed greatly dilated perineuronal and perivascular spaces, vessels devoid of blood, a vacuolated cortex and the general picture of cerebral edema.

#### COMMENT

Farrell<sup>7</sup> insists that the incidence of typhoid in infancy and childhood is much more frequent than is generally thought. He suggests that the failure to recognize the possibility of typhoid in differential diagnosis and a consequent failure to make adequate laboratory studies has resulted in diagnostic errors. This in turn has caused a paucity of reported cases. Naturally, this has led to the belief that typhoid in infants is so rare as to be worthy of little consideration in differential diagnosis.

That the lesion of typhoid in this case could be studied in its early stage is a rare opportunity. The fact that the large pale mononuclear cells, so abundant in the germinal centers of Peyer's patches, are seen apparently passing through the germinal center wall of lymphocytes into the lymph node sinuses suggests a possibility as to the origin of these cells. The relative scarcity of these cells in the mesenteric lymph nodes and their absence in the spleen and liver lend further weight to this suggestion as to origin.

The convulsions in this uncomplicated case of typhoid were probably due to the overwhelming toxemia with cerebral inflammation and edema.<sup>8</sup> The family history of epilepsy lent materially to the diagnostic confusion and emphasizes further the necessity of careful laboratory studies, in addition to thorough histories, in these cases of infantile convulsions.

THROMBOSIS OF RENAL ARTERY SIMULATING  
CORONARY THROMBOSIS

JOSEPH B. WOLFFE, M.D. AND DAVID J. DONNELLY, M.D.  
PHILADELPHIA

We wish to report this case for the following reasons. The patient presented a diagnostic problem on admission. Few cases of thrombosis of the renal artery have been reported in the literature. The clinical manifestations of renal artery thrombosis are as yet not well recognized and therefore not thought of. Early recognition of the syndrome and proper therapy may prevent extensive renal pathologic changes.

While many cases of renal infarction due to emboli and thrombosis of the small branches of the renal artery secondary to nephritis,<sup>1</sup> trauma<sup>2</sup> and periarteritis<sup>3</sup> have been reported we found in the literature only an incomplete description of the syndrome, reported by one of us<sup>4</sup> and 3 cases of renal thrombosis of the renal artery<sup>5</sup> associated with general vascular disease.

There is no complete description as far as we can find, in any textbook or periodical of the clinical manifestations of thrombosis of the renal artery.

The case we are about to present simulated to some extent coronary thrombosis.

REPORT OF CASE

F. D., a white man aged 58 the manager of a garage was seized with severe pain below the left nipple while walking in the street. He was admitted to Temple University Hospital in a state of shock. The pain was agonizing and only slightly relieved following the administration of  $\frac{1}{2}$  grain (0.032 Gm) of morphine subcutaneously. He perspired profusely and had the desire to defecate.

The pulse was full and 90 a minute, the respiratory rate was 30 and the blood pressure was 190 systolic and 100 diastolic. He had an ashen gray appearance. The peripheral vessels were slightly thickened. The size of the heart was within normal range and the muscle tone of the heart was good. The supracardiac area of dullness was slightly increased. There was a short systolic murmur at the apex which was not transmitted. The second aortic sound was accentuated. There was no evidence of congestive cardiac failure and the lungs were resonant. The left rectus muscle was slightly rigid. There was some left sided abdominal tenderness and increased rigidity of the left lumbar muscles.

Because the patient experienced a slight attack of precordial pain following effort several weeks prior to this episode coronary thrombosis was suspected. An electrocardiogram taken on admission failed to reveal any definite abnormalities.

A few hours later the pain shifted more to the region of the left kidney. Despite the fact that the patient was under the influence of morphine the left lumbar muscles became more rigid and there was definite tenderness of the kidney.

Because of the localization of the pain its severity, well defined shock and prostration, a renal disorder was suspected and a provisional diagnosis of renal calculus or thrombosis of the renal artery was made.

Examination of the urine revealed occult blood and many red blood cells. The pain soon became localized over the region of the left kidney. The abdomen became distended but there was still some precordial pain present. The temperature was elevated for four days ranging between 99 and 100.2 F.

There was definite leukocytosis (19,700) with a polymorphonuclear count of 86 per cent.

After several days the urine cleared up. The patient commenced to feel more comfortable and after four days he was apparently free of pain. The abdominal distention diminished and the blood pressure on the fourth day was 150 systolic and 90 diastolic.

A second electrocardiogram was taken which failed to reveal any abnormalities.

On the sixth day intravenous urography was done which revealed the following. The upper calices on the left side filled out well and were of normal appearance. The middle and the lower calices filled out poorly and suggested an area of infarction. No renal calculus were visualized. We therefore felt by exclusion that the diagnosis of thrombosis of a lower main branch of the left renal artery was justified. An embolic phenomenon was ruled out since there was no evidence of systemic disease to predispose the patient to it.

One of us (J. B. W.) has been studying cases of this type for the past six years and the following remarks are based on observations made on 11 cases.

Renal artery thrombosis is not an uncommon manifestation of generalized atheromatosis. In most of the observed cases there was a fairly typical syndrome which would lead one to suspect the lesion.

The attacks are ushered in with severe pain over the kidney region or in the loin depending on the site of the lesion, and resemble renal colic in many respects.

Frontal headache, backache, nausea, generalized abdominal pain and shock are characteristic symptoms in this vascular catastrophe.

In the majority of cases the blood pressure was elevated, although 4 cases did not show any elevation in pressure. The temperature tended to fluctuate for a few days between 99 and 102 F. In several cases there was frank hematuria. Eight cases showed occult blood in the urine. In 3 cases the urine was not examined until the third and fourth days following the attack. In these specimens of urine blood was not found.

In most cases there was radiation of the pain to the lower part of the abdomen and the back. In 4 cases the pain radiated to the thighs. Six cases showed definite vasovagal disturbances—faintness and dizziness. Five of these cases also showed evidence of a sympathetic paralytic ileus.

On intravenous urography all the cases we studied showed definite filling defects on the affected side. Retrograde pyelography, however, which was done in 5 of these cases, failed to show any abnormalities.

Eight cases, seen immediately following the acute catastrophe, showed definite leukocytosis fluctuating from 19,000 to 34,000 cells with a high polymorphonuclear count averaging 89 per cent.

All these cases showed definite evidence of atheromatous changes particularly involving the proximal portion of the aorta.

In 2 cases the follow-up intravenous urography done six and nine months respectively following occlusion of the renal artery showed normal configuration of the calices.

Intravenous urography in 1 case, done eleven months after the attack revealed an unchanged filling defect in the affected kidney.

One patient, seen in consultation, died in shock due to urinary suppression. Thrombosis of a main branch of the renal artery was found at autopsy. (It is quite possible that the administration of mercurial diuretics and failure to combat shock by available methods might have contributed to the fatal outcome.)

CONCLUSION

A syndrome associated with severe pain over the kidney region, frontal headache, nausea, shock, leukocytosis, hematuria, backache and abdominal tenderness seen in persons who present evidence of atheromatous cardiovascular disease should make one suspect thrombosis of the renal artery.

The prognosis is favorable if the treatment is similar to that used in coronary thrombosis. In all the cases that we observed an uneventful recovery was made, with the exception of the 1 seen in consultation.

It is possible that unrecognized and untreated lesions of this type may be responsible for many cases of hypertension complicating atheromatosis.

Its recognition and proper management may be an important step in the prevention of this complication as well as of extensive renal damage.

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION  
OF THE FOLLOWING REPORTS

HOWARD A. CARTER, Secretary

### ABSTRACT OF MINUTES OF MEETING OF COUNCIL ON PHYSICAL THERAPY, DEC 12 AND 13, 1941

The seventeenth annual meeting of the Council on Physical Therapy was held at the headquarters of the American Medical Association, Dec 12-13, 1941. Dr. Harry E. Mock, Chairman, presided. The following members were in attendance: Dr. H. E. Mock, Dr. Eben J. Carey, Dr. Anthony C. Cipollaro, Dr. W. W. Coblentz, Dr. I. S. Conley, Dr. A. U. Desjardins, Dr. W. F. Garvey, Dr. Frank H. Kinsen, Dr. Frank R. Ober, Dr. Ralph Pemberton, Dr. H. B. Williams and Mr. Howard A. Carter, Secretary.

#### GRANTS FOR RESEARCH

After reviewing the report of the Committee on Research, it was the opinion of the Council that the grants had yielded excellent results in basic scientific work. Not only has much work been accomplished by the investigators, who have been assiduous in their application, but the papers which have been published redound to the credit of the Council.

Revisions of the Official Rules of the Council occupied considerable time. The revised rules will be published at an early date.

#### ARTIFICIAL LIMBS

The question of whether the Council was prepared to consider artificial limbs with the object of including them on the list of accepted devices, was discussed. Since making and fitting an artificial limb is a matter of physician-patient-manufacturer relationship and since much depends on the art of fitting by the leg maker, the Council decided not to consider individual makes of artificial limbs but to deal with the subject in a more general way. Since the meeting, the Handbook on Amputations has been published.

#### EDUCATION

Several years ago the Council appointed a group of Consultants on Education. These consultants were asked to encourage local medical societies to reserve at least one program during the year for subjects dealing with physical therapy. Consultants were available for speaking engagements, and they suggested to local program chairmen speakers specialized in physical therapy to appear on programs. Efforts of the consultants are now beginning to bear fruit, the Council surveys with pleasure the activities of these consultants. Many more schools of medicine are making provisions for instruction in physical therapy for the undergraduate student. It is gratifying for the Council to know that articles on internal medicine, surgery, dermatology and in fact all branches of medicine more and more contain references to physical agents and their therapeutic value. It was reiterated by the Council that the important agents employed in physical therapy are heat, massage and therapeutic exercise and that 90 per cent of the therapeutic value was obtained from them, while only 10 per cent was realized from mechanical apparatus.

#### ARTIFICIAL RESPIRATION

Evidence regarding automatic appliances for administering mechanical respiration was considered most carefully. There was evidence to indicate that artificial respiration applied by means of positive and negative pressure was effective in reviving asphyxiated victims, no evidence was presented to indicate that burst lungs and other pathologic conditions were caused by this form of resuscitation. At the same time the Council pointed out that life saving crews should have a complete knowledge of manual artificial respiration and reaffirmed its previous statements on the importance of giving instruction in the Schafer prone pressure method of artificial respiration to the general public. Apparatus for aiding in life saving, whether inhalator or resuscitator, is usually not on the scene of the accident and it might take anywhere from five minutes to one-half hour before the apparatus is applied to the patient.

It is vitally important that artificial respiration be administered immediately. A report was made on the Council's survey of artificial respiration, in which many industrial organizations, police and fire departments and government agencies are cooperating. Data are being received on many forms of artificial respiration, both manual and mechanical. That further laboratory evidence might be made available, the Council voted to ask the Board of Trustees for substantial funds to aid in research in this important field.

#### RESPIRATORS

Activities of the Consultants on Respirators were reported. The Council observed that the term "iron lung" had crept into the literature as a substitute name for respirator. It was felt that this term was scientifically inaccurate and that devices for giving prolonged artificial respiration should not be accepted under this name.

The Council voted to express its appreciation to Mr. M. K. Reynolds for his specifications on how to assemble a simple workable respirator in case of a poliomyelitis epidemic.

#### PHYSICAL THERAPY TECHNICIANS

Medical preparedness as related to physical therapy was discussed at length. It was pointed out that there was a shortage of trained physical therapy technicians to supply any army needs. The present plan in the army during war time calls for three hundred general hospitals of one thousand beds each. This means that two thousand one hundred physical therapy technicians will be needed. Then the question arose as to the proper method of training technicians. It was decided that the Council on Physical Therapy should cooperate with the Council on Medical Education and Hospitals to arrange for streamlining the curriculums in the several accepted schools so that the technicians might be trained in six months instead of nine. This means that technicians will not receive the requisite amount of clinical practice but that this instruction will be obtained in the course of active duty in the army. After the necessary hours have been put in at practical work a diploma will be awarded, provided the student's record is otherwise satisfactory. Between one thousand four hundred and one thousand six hundred registered physical therapy technicians are now available, this is inadequate to supply the demand. Hence the Council concurred with the suggestion of the technicians that a number of physical therapy assistants be trained. The training, however, will be much less—six weeks, for example—than that given to regular technicians. The Council adopted the motion that publicity be given to the fact that there is an extreme need for training physical therapy aids in the army and that those students who have had two years of college work, including courses in physics and biology, be especially approached and encouraged to enter courses of physical therapy in schools approved by the Council on Medical Education and Hospitals.

The Council stands ready to give advice to any physician who is interested in special training in physical therapy in order to head a department in a medical school or army hospital. A new publication of the Council, "Manual on Physical Therapy" which will consist of terse monographs relating to physical therapy, may be used by civilian physicians and army medical officers. It is expected to be published serially in *War Medicine* and later collected for distribution as a small manual.

#### RADIO INTERFERENCE

A report was read before the Council concerning the activities in eliminating radio interference by short wave diathermy equipment. It now appears that the most satisfactory way of avoiding interference will be the selection of three radio bands in harmonic relationship and that the tolerances of the high frequency energy generated be confined to these channels at approximately the same tolerance as that of the broadcasting stations. Those devices not designed to operate on set frequencies will have to be screened. Research and tests on sample apparatus which have been submitted to the Council and to the National Bureau of Standards have proved that diathermy apparatus can be made to meet the requirements, although it appears that the cost will be somewhat more. The Federal Communications Commission, with which the Council is cooperating, has not as yet assigned the frequencies or established the tolerances.

## ULTRAVIOLET LAMPS FOR DISINFECTION

The Council reviewed its activities in connection with the acceptance of ultraviolet lamps for disinfecting purposes. It is the opinion of the Council that the publication of a report on the subject was as far as it cared to go at the present time.

## APPARATUS ACCEPTED

The 1942 edition of "Apparatus Accepted" was presented and announced as now ready for distribution.

## AN APPRECIATION

The Council on Physical Therapy desires to take this opportunity to express its feeling of gratitude and appreciation of the services of the following consultants whose assistance in carrying out the work of the Council has been given so freely.

Drs. Fred L. Adair, Walter M. Boothby, Milton B. Cohen, W. Allen Conroy, Alexander Day, Gertrude Takats, Samuel Feinberg, Hart Fisher, Alexander Hollander, Archibald Hovne, K. K. Jones, Leland McKittick, Harry L. Mock Jr., Stuart Mudd, Tell Nelson, S. L. Osborne, Winthrop Phelps, O. H. Robertson, E. C. Stakman, Lauriston Taylor, Ralph Waters, W. F. Wells and Mr. J. C. Stenberg.

*Audiometers and Hearing Aids*—Drs. C. C. Bunch, George M. Coates, E. P. Fowler, W. E. Grove, Isaac Jones, Douglas Macfarlan, C. Stewart Nash, Horace Newhart, Paul Sabine, B. R. Shurly and W. P. Wherry.

*Educational Work*—Drs. Frances Baker, Benjamin Boynton, Muriel Case Downer, Earl C. Elkins, F. H. Fwerhardt, Richard Kovacs, Fred B. Moor, W. H. Northrup, William Schmidt, Walter M. Solomon, Arthur L. Watkins and Walter J. Zetter.

*Artificial Limbs*—Drs. S. Perry Rogers, Paul Steele and Philip Wilson and Messrs. McCarthy Hanger Sr., W. L. Isle, J. B. Korrad, Joseph Spivak and David E. Stolpe.

*Electrocardiographs*—Drs. A. R. Barnes, George Fahr, Harold L. B. Pardee, W. D. Stroud, Carl J. Wiggers and Frank N. Wilson.

*Respirators*—Drs. W. B. Cannon, Edward L. Compere, Charles McKham and James Wilson.

WESTINGHOUSE CONSTANT INTENSITY  
STERILAMPS

(Operating Room, Hospital Nursery and  
Hospital Ward Models)

## ACCEPTABLE

Manufacturer: Westinghouse X-Ray Company, Long Island City, N. Y.

The Westinghouse Constant Intensity Sterilamp Units, Operating Room, Hospital Nursery and Hospital Ward Models, are designed to provide a more favorable environment for the care of patients by lowering the bacterial contamination level of the air surrounding the patient. These lamps produce essentially monochromatic ultraviolet radiation, wavelength 2,537 angstroms, and are mounted in fittings of various types for installation in operating rooms, nurseries and in isolation and contagious wards.

In appearance the Sterilamp is a slender rod-shaped glass tube flaring slightly at each end where the electrodes are located. The high emission cold electrodes and mercury vapor combined with certain rare gases under very low pressure are contained in the high transmission glass envelop having a radiation cut-off at approximately wavelength 2,200 angstroms. In the table is the energy distribution of a standard Sterilamp operating at 40 milliamperes.

Sterilamp units are self contained and operate on 115 volt, 60 cycle alternating current circuits. Essential parts are the sockets and transformer housings, intensity adjusting control, louvers (where needed) and one or more straight or curved Sterilamps. These parts comprise the chassis, which can be wall or ceiling mounted or attached directly to existing illuminating fixtures.

Nursery-type Sterilamp units, installed over or near bassinets, are equipped with adjustable baffles to prevent exposure of the infants to ultraviolet radiation. The baffles permit arrangement to shade the bassinets the radiation falling on the area above and below them.

Lamps installed in isolation and contagious wards are similar to those used in the nursery, each equipped with baffles to shade the beds. An irradiated field is maintained above and below the beds, the aisles ways used by nurses and attendants are also irradiated. Two Sterilamp units may be used on either side of the ward entrance as a barrier to the passage of pathogenic organisms in or out of the ward.

For use in operating rooms the Sterilamps are arranged to suit varying requirements. A typical arrangement shows a unit attached to the central surgical lighting fixture or mounted on either side of it and four auxiliary Sterilamp units mounted on each of the three walls and one over the entrance.

Sterilamp installation includes a control cabinet containing a compensator for maintaining the radiation intensity of the central unit throughout the life cycle of the tubes and an adjustable regulator equipped with a pointer handle and graduated dial, for varying the intensity. The control cabinet is

## Energy Distribution

| Wavelength in Angstrom Units | Intensity Radiated in Microwatts per Square Centimeter at 1 Meter |
|------------------------------|---|
| 2,537                        | 26.00   |
| 2,552                        | 0.793   |
| 2,804                        | 0.027   |
| 2,891                        | 0.017   |
| 2,967                        | 0.135   |
| 3,022                        | 0.066   |
| 3,129                        | 0.510   |
| 3,654                        | 0.135   |
| 4,047                        | 0.514   |
| 4,359                        | 1.560   |
| 5,461                        | 0.850   |
| 5,780                        | 0.195   |

equipped with two mercury switches, one for the central Sterilamp circuit and the other for the auxiliary Sterilamp circuit. The control may be set for the approximate time allotted to the operation and this is designed to vary the intensity of the central unit to that recommended as safe tissue tolerance for the time of the operation.

The term "Constant Intensity" in the name of the unit refers to a plan of contract inspection carried out by the firm. The plan of inspection is carried on in this manner. At the time of installation each unit is calibrated by the firm's representative with an SM-200 Ultraviolet Meter (Council accepted). The unit is inspected at periodic intervals thereafter, and the replacement of the tube is ordered when the compensator will no longer restore the constant intensity. When operated at their rated currents, the Sterilamps lose their output of radiation at 2,537 angstroms with age and reach 50 per cent of their initial output after four thousand to six thousand hours of continuous burning (six to nine months).

In its investigation of the Sterilamp, the Council found that the ultraviolet output of a single tube ranges from 16.5 to 18.2 microwatts per square centimeter, since two tubes are used in a unit, the ultraviolet output is doubled or is 33 to 36 microwatts per square centimeter at 1 meter from the lamp unit. These measurements show that the ultraviolet output of the lamps complies with the Council's requirements of 20 microwatts per square centimeter at 1 meter from the unit. The requirements are set forth in the Council article "Acceptance of Ultraviolet Lamps for Disinfecting Purposes."

The production of ozone is probably not "controlled" intentionally as claimed by the firm, and if it is generated intentionally in an amount sufficient to disinfect or "protect" areas "not directly irradiated" it will be injurious or at least objectionable to the occupants.

The Council on Physical Therapy voted to accept the Westinghouse Constant Intensity Sterilamp Units—Operating Room, Hospital Nursery and Hospital Ward Models—for inclusion on its list of accepted devices.

SAURDAY, MAY 2, 1942

## THE ATLANTIC CITY SESSION

Nowhere in this issue (p 37) appears the special information relative to the ninety-third annual session of the American Medical Association, which will be held in Atlantic City, June 8 to 12. The reservations already made by many of the leading hotels in Atlantic City indicate that an excellent attendance may be anticipated. Indeed several of the hotels are already reserved to their capacity. The appreciation of the medical profession should be extended to the Local Committee on Arrangements for its continuous effort to insure the usual smooth running arrangements associated with the conduct of a session in Atlantic City. Many alumni and fraternity organizations have planned special functions, and the Woman's Auxiliary has developed an extensive program with a number of distinguished guests and speakers. Many officials of the federal government associated with the war effort are scheduled to participate in some of the programs.

Attention is called particularly to the program of the general scientific meetings, which appears on page 48. It will be observed that one session is an Inter-American meeting with participants from some of our neighboring countries. Another session is devoted largely to military-medical problems and still another session is designed to bring to the attention of visitors recent advances in medical practice.

The programs of the scientific sections are replete with papers of current interest in the field of public health and the war effort. There are symposiums on the newer methods in the treatment of infections of the sinuses and of poliomyelitis. There are round table discussions and question and answer periods, which proved so popular in previous meetings. Special attention should be called also to the program of the Section on Industrial Medicine and Public Health (p 56) as an example of the contribution of the American medical profession to the war.

The meetings of the Section on Miscellaneous Topics are designed particularly to cover the fields of general practice and legal medicine. Here are two unusual programs which should have great appeal.

Applications for the Scientific Exhibit were well beyond the capacity of the available space. Special lectures and demonstrations have been planned on poliomyelitis, diabetes, the work of the Selective Service and on civilian defense. The motion picture program (pp 78 and 79) is a further indication of the vast progress that has been made in visual education. Certainly few physicians can fail to find in the material thus made available much that will prove of exceeding value.

## FIVE THOUSAND PHYSICIANS NEEDED IMMEDIATELY FOR THE ARMY MEDICAL DEPARTMENT

Under the heading of Medicine and the War in this issue of THE JOURNAL appears an official announcement from the Procurement and Assignment Service indicating that five thousand physicians are needed immediately for the Army Medical Department. The plan under which recruitment will proceed was developed at a meeting held in Washington on April 24. To this meeting all the state chairmen of the Procurement and Assignment Service of the states east of the Mississippi River were invited. A second meeting will be held in Omaha on May 8 for all the state chairmen of the Procurement and Assignment Service and representatives of the Army Medical Department of states west of the Mississippi River.

The enrollment forms and questionnaires have been going steadily into the mails for more than a week. If, therefore, any physician fails to receive his enrollment form and questionnaire before May 9 he should write at once on that date to the National Roster of Scientific and Trained Personnel in Washington, requesting a duplicate form together with the letters of instruction. Reports from Washington indicate that those physicians who have received the enrollment forms have in a tremendous number of cases filled them out immediately and returned them, and the forms are pouring into the Washington headquarters. The complete functioning of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians demands the complete cooperation of the medical profession. Since this organization was created to aid the medical profession in meeting the needs of the Army, the Navy and the civilian population, physicians should accept the responsibility and enroll immediately.

The new form of recruitment does not apply to dentists and to veterinarians, since there does not exist any immediate shortage in these groups. It does apply particularly to the medical profession, since the Army still demands 65 doctors for every thousand men enlisted and since it will require more than eleven thousand physicians by Jan 1, 1943 in addition to the five thousand that must be enlisted immediately.

The outline published under the heading of Medicine and the War gives information as to the rank which

physicians may anticipate in relation to their ages and special qualifications. It will be observed that special clearance will be required on all physicians who are to receive advanced rank. For this purpose the special evaluations and classifications developed by the special committees of the Division of Medical Sciences of the National Research Council, the headquarters of the American Medical Association, the certifying boards and the special societies are being utilized.

The winning of the war is a race against time. Among the agencies involved in the procurement and assignment of medical personnel are the headquarters of the Procurement and Assignment Service for Physicians, Dentists and Veterinarians, the consultant office in the headquarters of the American Medical Association, the personnel divisions of the offices of the Surgeon Generals of the Army and the Navy, the division concerned with the Air Force, the Corps Area Headquarters, the Corps Area offices of the Procurement Service and the state chairmen. There is much interlocking and intercommunication of these various agencies, which have been evolved rapidly to meet the current emergency. The complete cooperation of the individual physician is vital in securing the best results as far as concerns the provision of medical service for the armed forces and the civilian population.

#### SULFANILAMIDE FAST GONOCOCCI

Since the discovery of the phenomenon of artificially acquired serum fastness and arsenic fastness by spirochetes the possibility of the spread of drug resistant strains of pathogenic micro-organisms to the general population has been of epidemiologic interest. About three years ago demonstration was made that the gonococcus readily acquires an *in vitro* resistance to the newly introduced sulfonamides. Boak,<sup>1</sup> Westphal<sup>2</sup> and others, for example, showed that all strains of the gonococcus tested by them readily acquired a tolerance to relatively high concentrations of sulfanilamide or sulfapyridine if cultivated in a medium to which gradually increasing amounts of these drugs were added. The Bangs<sup>3</sup> showed that this acquired drug fastness may be returned for at least a year on subsequent cultivation on mediums free from the drug. Working with experimental gonococcal infection of the chorioallantoic membrane of embryo chicks the Bangs<sup>3</sup> also showed that the minimum dose of sulfanilamide adequate for the cure of routine gonococcal infection of the chick embryo is wholly ineffective when tested against sulfanilamide tolerant strains, approximately ten times the routine concentration of the drug being necessary to effect a cure.

Following laboratory<sup>3</sup> and clinical<sup>4</sup> evidence that sulfathiazole is more effective therapeutically than the earlier sulfonamide compounds, Carpenter, Charles and Allison<sup>5</sup> of the School of Hygiene, Johns Hopkins University, tested the power of the gonococcus to acquire resistance to sulfathiazole. In control tests they found that within fourteen days all strains of gonococci grown on gradually increasing concentrations of sulfanilamide acquired at least a tenfold sulfanilamide tolerance. This acquired tolerance was apparently specific, since the adapted micro-organisms were still fully susceptible to sulfathiazole. Attempts made to grow the same strains in gradually increasing concentrations of sulfathiazole, however, were unsuccessful. After seventy-four days' growth in their minimum concentration of this drug (0.002 per cent), none of the strains had acquired the ability to grow in their next higher concentration.

The failure of the gonococcus to develop resistance to sulfathiazole suggests that sulfathiazole fast strains are not likely to be developed in the clinic or to be spread to the general population. Dissemination of sulfanilamide or sulfapyridine fast strains, however, is a theoretical possibility. Carpenter and his colleagues believe that the inability of the gonococcus to develop a tolerance to sulfathiazole accounts for the relative clinical efficiency of this drug. Titration in the chick embryo convinced the Bangs that sulfathiazole is three times more effective therapeutically than sulfanilamide.

### Current Comment

#### FAMILY NUTRITION

As a part of its contribution to the campaign for improved nutrition the Philadelphia Child Health Society has published a monograph, with the aid of a grant from the Beneficial Industrial Loan Corporation, entitled 'Family Nutrition'. This monograph covers the general subject of nutrition, methods of measurement of nutritional status, the dietary value of common foods, nutritional needs, the relationship of food intake and appetite to the nutritional status and some considerations of balanced diets and balanced budgets. The pamphlet concerns even the child who will not eat what he needs because the dinner table is too often a battleground or an amusement park. Menus for each of five groups of families covering two week periods are provided based on family income. As a war measure the pamphlet is offered for free distribution to those teaching nutrition in formal school classes, those holding nutrition classes or meetings as a part of the war program, Red Cross workers, women's

club leaders and others who may need a monograph of this kind. The monograph is obtained by writing to the Philadelphia Child Health Society, 311 South Juniper Street, Philadelphia.

### THE KILLING OF BACTERIAL SPORES BY AGITATION

Bacterial spores are notoriously resistant to injurious influences. Heat, disinfectants and desiccation, which are fatal to the vegetative forms of bacteria, fail to kill the spores of the same or other species of organisms. The use of the shaking machines in bacteriologic laboratories for the killing of spores has been almost unnoticed although Meltzer apparently observed this phenomenon nearly a half century ago. Last year an observation led Curran and Evans<sup>1</sup> to undertake experiments to demonstrate the effect of agitation on spores. In the presence of abrasives they subjected suspensions of spores of test organisms to agitation in the shaking machine at 430 shakes per minute with a stroke amplitude of 1.8 inches. The samples of spores and vegetative cells were suspended in distilled water or broth in 8 ounce bottles. Among the several abrasives used in the experiments were sand, emery, silicon carbide, pyrex chips, aluminum and small glass beads. The criterion of germicidal activity was the number of spores that survived five hours of shaking. The difference between the number of colonies that developed on glucose extract agar plates before and after prolonged shaking with abrasives was regarded as a measure of the test influence. The sporicidal efficiency of the glass beads was remarkable. The result was that bacterial spores and the vegetative forms were progressively destroyed by long and vigorous shaking. The spores died at a rate which corresponded with the unimolecular law for chemical reactions. The rapidity with which spores were destroyed differed with the nature and quantity of the abrasive used, the size of the particles and the species and density of the spore formation. Sporicidal efficiency was progressively increased as the speed of shaking was increased between 330 and 570 revolutions per minute. Foam producing substances, such as broth in which the organisms were cultivated, reduced the germicidal efficiency of this procedure. The resistance of the spores to shaking was not correlated with their thermal resistance. There may be, however, a danger inherent in the practice, as the organisms agitated may not only be killed but their functions may be changed. Brown, of the U. S. Department of Agriculture, has repeatedly obtained invertase from yeast suspensions shaken with sand. Shaking procedures, therefore, may offer promise in the production of endoenzymes of micro-organisms. This procedure will require further trial. It seems to offer a simpler and more economical method for the killing of bacterial spores.

### THE INDEX NUMBER

Last week's issue, *THE JOURNAL* for April 25, was the Index Number. This was in accordance with an action taken by the Board of Trustees of the American Medical Association providing that hereafter *THE JOURNAL* shall be published in three volumes each year, covering the respective periods of four months each. This makes three index numbers annually instead of two, as was formerly the case. The content of *THE JOURNAL* is now so large that binding in two volumes makes a book so bulky that it is difficult to handle under ordinary conditions of work in libraries. Thus volume 118, which ended with the issue for April 25, contained 1,578 pages of reading matter. This incidentally is from two to four times the amount of material made available in any other weekly medical publication.

### PLANTS AND MALARIA CONTROL

The control of malaria involves procedures directed against the parasite or its anopheline vector, as well as measures designed to protect the human host from the bite of infected mosquitoes. Aquatic plants are concerned in this malarial triangle, for they provide food and shelter for the larvae of the vector. Plant scientists may thus aid in the control of malaria by determining the relation of each type of plant to anopheline propagation and by devising methods for holding objectionable species in check. An example of this type of work is described by Penfound<sup>1</sup> in a recent report on plant investigations carried on by the Tennessee Valley Authority during the summers of 1937 to 1940. One object of this study was to minimize the breeding of mosquitoes through proper preparation and maintenance of reservoirs. This involves complete clearing to insure reasonable mosquito control after impoundage and strict curbing of objectionable shoreline vegetation. Herbaceous plants in particular present a definite mosquito problem, the most offensive have been delineated and their life histories investigated. Plant control methods at the present time include removal, recurrent cutting and the application of herbicides. As pointed out by Penfound, the study of obnoxious plants is fundamental to adequate maintenance of reservoirs and permits the subsequent undertaking of an intensive campaign to prevent or limit the colonization of certain critical species. The importance of aquatic and semiaquatic vegetation and of flottage in connection with the problem of malaria control in the Southeastern states has been emphasized.<sup>2</sup> The attention being paid to this aspect of the problem by plant scientists constitutes a significant, albeit inconspicuous, service in the interest of public health.

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## PROCUREMENT AND ASSIGNMENT SERVICE FOR PHYSICIANS, DENTISTS AND VETERINARIANS

### NEW METHOD FOR IMMEDIATE RECRUITMENT OF MEDICAL OFFICERS

The army has streamlined its method of commissioning medical officers. Five thousand physicians are needed at once. Eleven thousand additional will be needed by Dec 31 1942. Army officers' recruiting boards will proceed at once to the office of each state chairman for physicians of the Procurement and Assignment Service to get in touch with physicians personally and commission them immediately.

#### INSTRUCTIONS FOR PHYSICIANS WISHING TO ENLIST

1 Return the procurement and assignment enrolment form and questionnaire which reached you last week. If you didn't get one, write immediately to the National Roster of Scientific and Specialized Personnel 916 G Street N W, Washington, D C, for your forms.

2 Contact your state chairman of physicians for Procurement and Assignment Service at once, stating that you want to get into the service. Do this regardless of whether or not you have written to the Washington office of the Procurement and Assignment Service or the Surgeon General or have enrolled on the emergency enrolment form of last December. If you applied for commission more than thirty days ago, tell the state chairman you want to see the recruiting board.

3 The Surgeon General will not commission a physician unless he is certified as available by his state chairman of physicians for the Procurement and Assignment Service.

#### HOW COMMISSIONS WILL BE SECURED

1 The Surgeon General and the Adjutant General have named teams of two officers and two clerks, who will procure the names of all available physicians who have volunteered from the state chairman for physicians of the Procurement and Assignment Service in your state.

2 These teams will have the authority to make final decisions on the application forms, to procure and make final decisions on the physical findings and to administer the oath of office immediately to those who qualify physically and professionally who are under the age of 45 and who are to be given the rank of lieutenant or captain.

3 These teams have the authority to initiate the applications and physical examinations and forward the papers with their recommendations direct to the Surgeon General for commission for all physicians under the age of 45 who might apparently be qualified for rank above that of captain.

4 These teams will have the authority to initiate the applications and physical examinations and to forward

to the Surgeon General direct the papers and their recommendations on all physicians 45 to 54 inclusive. The Surgeon General will make the final decisions and commission those for whom there are vacancies in this age group.

#### WHAT RANK MAY BE EXPECTED?

In order that all concerned in the procurement of additional medical department officers may give uniform advice to all applicants the following summary of the policies which broadly govern the recommendations to be made to the Adjutant General are published for your information and guidance.

(a) *Basic Considerations* — (1) Appointments in the Army of the United States (medical department) will be recommended by the Surgeon General to fill authorized position vacancies for which no qualified medical department officers are available. The recommended applicants must possess the special qualifications required for such positions.

(2) Since no training or experience in civil life is analogous to that afforded by active military duty no initial appointments will be recommended in grades above the lowest for assignment to tactical units.

(3) Position vacancies calling for grades above the lowest will, so far as possible, be filled by the promotion of qualified officers on active duty.

(b) *Policy Governing Grades for Various Sections* — (1) Medical Corps. All appointments will be recommended in the grade of first lieutenant with the following exceptions:

(a) *Captain*. 1 Eligible applicants between the ages of 37 and 45 will be appointed in the grade of captain by reason of their age and general unclassified medical training and experience.

2 Below the age of 37 the following recognized training and experience will be considered in recommending initial appointments in the grade of captain: certification by an American specialty board, fellowship, American College of Surgeons or American College of Physicians, membership in other nationally recognized qualifying society or association, or the formal hospital training equivalent to that required by an American specialty board or other recognized training appropriate to the assignment for which recommended.

3 Eligible applicants who previously held commissions in the grade of captain in the Medical Corps (Regular Army, National Guard of the United States, Officers' Reserve Corps) may be appointed in that grade provided they have not passed the age of 45.

(b) *Major* 1 Eligible applicants between the ages of 37 and 55 for whom there exist appropriate position vacancies, who are qualified for appointment as captain as outlined in paragraph (1)(a)2 and whose additional training and experience justify initial assignment as chief of service or section or executive officer in a large military hospital or other appropriate position, may be appointed in the grade of major

2 Applicants previously commissioned as major in the Medical Corps (Regular Army, National Guard of the United States, Officers' Reserve Corps) whose train-

#### Rate of Pay

|                    | With Dependents | Without Dependents |
|--------------------|-----------------|--------------------|
| Lieutenant Colonel | \$5,588         | \$4,676            |
| Major              | 4,848           | 3,936              |
| Captain            | 3,792           | 3,336              |
| First Lieutenant   | 3,152           | 2,696              |
| Second Lieutenant  | 2,196           | 2,196              |

ing and experience qualify them for an appropriate assignment may be appointed in the grade of major, provided they have not passed the age of 55

(c) *Lieutenant Colonel and Colonel* 1 In view of the small number of assignment vacancies in the grades of lieutenant colonel and colonel and the large number of reserve officers of these grades who have not been ordered to active duty, such appointments will be limited to specially qualified applicants required for specific position vacancies which cannot be filled by promotion or by the activation of qualified reserve officers

### DIRECTORS OF AFFILIATED UNITS URGED TO ENCOURAGE IMMEDIATE ACTIVE DUTY ON INDIVIDUAL MEMBERS

The office of the Surgeon General of the Army has just sent the following letter to directors of affiliated units

1 As you are aware appointments made in the Officers' Reserve Corps or in the Army of the United States for the purpose of assignment to a specific affiliated unit may be terminated on the request of the institution or that of the individual officer. Accordingly, these officers are not considered available for active military duty prior to the activation of the unit without their request and the approval of the institution authorities. This policy has resulted in the immobilization of a very large number of highly trained officers at a time when the shortage of medical officers is assuming serious proportions.

2 The Surgeon General requests that you urge officers assigned to your unit to consider seriously extended active duty at this time, for temporary assignment to named general hospitals or to station hospitals in this country, pending the activation of the unit to which they will then be reassigned.

3 It is not possible to anticipate the rate at which affiliated medical department units will be ordered into active military service. The use of unit personnel until such activation will, however, go far to alleviate the situation now existing in the majority of corps areas, the active duty training received by the individual officer will make him of greater value to the unit when it is called on to function.

4 Requests for extended active duty should be addressed to the Surgeon General and should state the date on which available. Each request should be endorsed by you and should show the date and place at which final type physical examination was made and the positions in the unit for which appointed. Your endorsement will be to the Surgeon General, through the surgeon of the corps area in which the officer resides.

5 The need for officers is acute. Your sincere cooperation is desired.

For the Surgeon General

FRANCIS M. FITTS,  
Lieutenant Colonel, Medical Corps, Assistant

NOTE—*a* There are in the age group 24-45 more than a sufficient number of eligible qualified physicians to meet medical department requirements. It is on this age group that the Congress, through the Selective Service Act, has imposed the definite obligation of military service. Applicants beyond this age will be considered for appointment only if they possess the special qualifications required for assignment to positions appropriate for the grade of major or above.

*b* Appointments for assignment to affiliated medical department units are made under special War Department authorization, and in grades authorized by appropriate tables of organization on recommendation of the authorities of the sponsoring institutions.

#### HOW SOON MAY ONE EXPECT TO ENTER SERVICE?

Immediate cooperation with the officers' recruiting boards will result in a commission sooner than it could otherwise be obtained. A slightly longer period of time will obtain in the case of those referred to the Surgeon General for decision. In each case a period of fourteen days is granted between the administration of oath of office and the date of reporting for duty. If an officer desires to report before this fourteen day period has expired, he may do so by appropriate statement to the recruiting board. It is advised that no steps be taken to close one's office until after one has taken the oath of office.

SAM F. SEELEY, M.D.,  
Executive Officer,  
Procurement and Assignment Service

### DISCHARGE RESERVE OFFICERS WHO FAIL TO RECTIFY CORRECTABLE DEFECTS

Any reserve officer, disqualified for active duty with the Army only because of a physical defect which is correctable who fails to correct the defect within a reasonable period of time or states that he does not intend to correct it, will be discharged from the service, the War Department announced on April 17. This policy does not apply to reserve officers who are disqualified because of a physical defect which is not correctable. Such officers may be separated from the service only by resignation. Formerly a reserve officer, declared ineligible for active duty because of disqualifying but correctable defects, continued to hold his commission even though he took no steps to correct the defects and thus fit himself for active duty. Within the past few months all reserve officers have been ordered to take physical examinations to determine their availability for active duty. When correctable physical defects disqualify the officer for active duty a reexamination is held at a set date, based on a reasonable length of time in which the defect might be corrected.

### HOW TO ADDRESS MAIL TO SOLDIERS

In keeping with its policy of prompt and certain delivery of soldier mail, the War Department has announced the following instructions designed to enable families and friends of soldiers to send their letters so that they will be delivered promptly.

#### OUTSIDE CONTINENTAL UNITED STATES

Mail addressed to army personnel serving outside the continental United States should clearly show

Grade, first name in full, middle initial and last name of person addressed, followed by his army serial number, if known.

Letter or number of the company or other similar organization of which the addressee is a member.

Designation of the regiment or separate battalion, if any, to which the company belongs.

Army postoffice number in care of the appropriate postmaster  
The location of the overseas station should not be used  
Name and address of the sender in the upper left corner

#### WITHIN CONTINENTAL UNITED STATES

Mail addressed to army personnel within continental United States should show the same information except that the postoffice address of the post or camp will be used preceded in appropriate cases by the APO number if applicable

Mail addressed to army personnel on maneuvers within the continental United States should show the same information as prescribed for outside continental United States. Prior to beginning of maneuvers the Post Office Department with the concurrence of the Army will designate the postmaster in whose care mail for personnel involved will be addressed

#### CORRECT FORMS

The following are examples of correctly addressed envelopes

1st Lieut Willard J Roe Med Corps U S Army  
167th Evacuation Hospital  
APO 801 c Postmaster  
New York N Y

Lieut (j g) Willard J Roe Med Corps U S Army  
U S S Texas  
% Postmaster  
San Francisco California

### THE ARMY NEEDS BACTERIOLOGISTS, BIOLOGIC CHEMISTS, SANITARY ENGINEERS AND ENTO- MOLOGISTS

The Surgeon General's Office has announced that there are vacancies in the Sanitary Corps of the Army for bacteriologists biologic chemists sanitary engineers and entomologists. Applicants desiring to apply for commissions in the Sanitary Corps should write to the Office of the Surgeon General and state their college training and civilian experience in detail.

Applicants must have had at least four years' actual experience, and in the case of bacteriologists this must be in medical diagnostic and public health bacteriology, in the case of biologic chemists, in diagnostic and public health biologic chemistry including blood urine, food, water and sewage chemistry, and toxicology, in the case of sanitary engineers, experience must include at least two of the following activities: mosquito control, rodent control, water supplies and sewage treatment. Applicants also must have completed a four years course in college during which special emphasis was laid on studies in the field in which they desire to be commissioned in the Sanitary Corps. The receipt of a higher degree, Master of Science or Doctor of Philosophy may be substituted for a part of the four years actual experience required. A professional examination is not required. Additional details concerning the qualifications of applicants for commissions in the Sanitary Corps may be obtained on request to the Surgeon General's Office, U S Army Washington, D C.

### RUSH MOBILE MEDICAL UNITS TO BURMA

To protect United Nations troops on the Burma front from malaria and cholera which are endemic in the spring, the Chinese Red Cross has sent nine mobile medical units to serve as close to the fighting front as possible. Each unit has a surgeon, two assistants, several dressers, eight or more stretcher bearers and two chauffeur-mechanics. The medical supplies are carried in trucks given by the American Red Cross, other equipment was furnished by the American Bureau for Medical Aid to China an agency of United China Relief. Dr Robert K S Lim of the Chinese Red Cross and Dr Chi-Teh-Loo, director of the Army Medical Corps, have flown from Chungking to Burma to supervise the inauguration of the antiepidemic program. Already on the Burma front are six ambulances and a surgical team manned by British and American Friends under the leadership of Dr Robert B McClure of Canada. A second group of six ambulances is on its way from the headquarters of the Friends Ambulance Unit.

### FUNCTION OF MEDICAL ADVISORY BOARDS

It has been brought to the attention of the National Headquarters of the Selective Service System, Washington D C that in some corps areas registrants are being referred back to local boards and medical advisory boards by the examining and induction stations for additional examinations, including laboratory and x-ray tests to determine their physical qualifications for induction.

The medical advisory board is an element of the Selective Service System. There is no objection to the use by the Army of the specialists on such boards provided the cost is borne by the Army and it is distinctly understood that such services are rendered to and for the Army. In no event should a registrant be referred back to local boards for an additional examination prior to a final action by the examining and induction stations.

A problem arises not infrequently at the examining and induction stations where the registrant declares that he suffers from epilepsy asthma or other conditions and yet presents no proof other than his bare statement. Because of lack of acquaintance with the registrant the examiner naturally is uncertain as to the truth or falsity of the statement. If such cases are rejected and returned to the local board a statement will be made by the examining and induction stations under Remarks on the 'Report of Physical Examination and Induction' (form 221) giving the basis for the cause of rejection. If the local board or its examining physician has reason to believe that the registrant has falsified such a statement, it may accumulate evidence to justify its belief and return the registrant at a subsequent date accompanied by such evidence.

LEWIS B HERSHEY, Director

### ST LOUIS PREPARES

More than a hundred thousand persons in St Louis are in training or have been assigned to duty in the community services of civilian defense and other protective functions, according to the *Star-Times*. By April 9 about three thousand members of the protective organization had already completed their training, however, the national Office of Civilian Defense recently increased their period of training from ten to twenty hours, making it necessary for these members to resume their studies. Of the total number mentioned, 58,871 were enrolled in Red Cross work and the community services. Among the others enrolled were 4,000 in the drivers corps, 450 in the rescue squads, 461 fire watchers, 2,438 auxiliary firemen, 5,350 air raid wardens, 3,160 in the emergency medical services, 213 nurses aides and 3,705 in the food and housing corps.

### BUREAU TO HANDLE PERSONAL PROPERTY LEFT BY UNITS GOING OVERSEAS

An Effects Bureau to handle storage and disposal of personal property left at camps and stations or on trains by military personnel on departure for overseas duty has been established by the War Department. The new bureau has begun operations at the Quartermaster Depot Kansas City, Mo. Units are sometimes required to leave home stations for duty abroad on short notice. Personnel of these units often leave personal effects behind. All such property, other than automobiles and household effects, will be shipped by station and camp commanders to the Effects Quartermaster at the Kansas City Depot. Station and camp commanders will have all containers or packages opened and examined in the presence of a commissioned officer, and all government property found thereon will be turned over to the appropriate local supply officer. Property of individuals will then be repacked, each in a separate container, for shipment to the depot.

The Effects Bureau is also charged with disposition of effects of personnel who may die overseas. The 112th Article of War provides that the Quartermaster Corps shall transmit the effects of deceased persons to the next of kin or beneficiary. When it is impossible to determine ownership of any property left, the property will be inventoried and shipped to the Depot, where it will be held until ownership can be determined.

### REQUEST FOR INCREASE IN RED CROSS BLOOD RESERVE

An additional 350,000 pints of blood from American volunteer donors has been requested by the Army and Navy, Chairman Norman H. Davis of the American Red Cross announced on April 22.

The blood, which will be collected by the Red Cross at its blood donor centers, is to be delivered during the year ending June 30, 1943. A total of 1,280,000 pints now has been requested by the Army and Navy, of which 380,000 is to be delivered by July 1. More than 250,000 pints already has been delivered and total donations are running around 17,000 a week. On this basis the Red Cross expects to exceed the amount requested for delivery by July.

It should be remembered, Chairman Davis stated, that our ability to make steady deliveries as requested by the Army and Navy depends on the willingness of those living near the eighteen Red Cross blood donor centers to volunteer as blood donors. Only with their continued cooperation shall we be able to supply the blood so badly needed by America's armed forces.

Red Cross blood donor centers are located in New York, Philadelphia, Baltimore, Buffalo, Rochester, N. Y., Indianapolis, Detroit, Pittsburgh, St. Louis, Boston, Cleveland, San Francisco, Milwaukee, Los Angeles, Chicago, Cincinnati, Brooklyn and Washington, D. C. Blood collected by these centers is shipped daily in refrigerated containers to laboratories designated by the Army, where it is processed into dried plasma to be used by the Army and Navy for emergency transfusions. Arrangements also have been made whereby limited amounts of dried plasma are being allocated to the Red Cross by the Army to be held for use in event of civilian disaster caused by enemy action in this country.

### THE GOVERNMENT NEEDS NURSING CONSULTANTS

The U. S. Civil Service Commission, Washington, D. C., announces that, while applications have been accepted for some time for public health nursing consultants in the lower grades, now the commission is seeking also consultants in the three higher grades with salaries of \$3,800, \$4,600 and \$5,600 a year. No age limits have been set.

Positions exist both in the United States and in foreign countries. The war service appointments will be made to extend generally for the duration of the war and not more than six months after. The duties are to plan and carry out nursing or nursing education programs and to act in an advisory capacity to federal agencies or to state, county or municipal organizations. There will be no written test. Applicants must have completed a four year course in a recognized college, with one year's special program of study in public health nursing, must have graduated from an accredited school of nursing, be registered nurses in some state and have had appropriate general public health nursing supervisory experience. Some positions are in the Children's Bureau and in the U. S. Public Health Service. Forms for applying may be obtained at post offices or from the commission in Washington.

### DR. BAEHR ADDRESSES DISTRICT SOCIETY

Dr. George Baehr, chief medical officer of the Office of Civilian Defense, addressed the District of Columbia Medical Society on April 1. Dr. Baehr is reported to have said that already three hundred hospitals throughout the country have banks for liquid plasma for emergencies, and that depots for dried blood plasma are being set up in strategic points for civilian use. Dr. Oscar B. Hunter, assistant chief medical officer of the District of Columbia, said that questionnaires had been sent out to medical technicians to determine how many are capable of typing and matching blood for transfusions and that nearly a thousand physicians in the District had already been classified and assigned to duties in cases of emergency.

### WANT STUDENT NURSES FOR ST. ELIZABETHS HOSPITAL

The U. S. Civil Service Commission has announced that fifty student nurses will be enrolled for training at St. Elizabeths Hospital School of Nursing, Washington, D. C., about Sept. 15, 1942 and March 15, 1943. Forms for applying may be obtained at post offices throughout the country or from the commission in Washington. Applications must be filed before May 13, 1942. The age limits are from 18 to 30 years, graduation from high school is required, although applications will be accepted from senior high school students who will complete the course not later than Jan. 31, 1943. They must be in good health and capable of performing arduous duties. St. Elizabeths Hospital is a government institution for the treatment of mental disorders. The training period will cover a three year course, including a probationary term of six months. Graduates of the course will be eligible for promotion to higher positions on the nursing staff.

### ILLINOIS MEDICAL ADVISORY COMMITTEE

Governor Green of Illinois appointed on March 29 a medical advisory committee to the committee on public health of the Illinois State Council of Defense. The members appointed were Drs. Charles H. Phifer of Chicago, president of the Illinois Medical Society, chairman, Edward H. Weld, Rockford, president-elect of the Illinois Medical Society, vice chairman, Roland R. Cross, director of public health, H. L. Pettitt, Morrison, Arlington Ailes, LaSalle, Robert S. Berghoff, Chicago, Harold M. Camp, Monmouth, E. S. Hamilton, Kankakee, James H. Hutton, Chicago, Raymond W. McNealy, Chicago, Paul L. Schroeder, Chicago, Bertha Shafer, Chicago, Herman M. Soloway, Springfield, Conrad Sommer, Springfield, Walter D. Stevenson, Quincy, Bert W. Caldwell, Chicago, Thomas G. Hull, Ph.D., Chicago, and Rodney Brandon, director state department of public welfare.

### MOBILE EMERGENCY UNITS IN WISCONSIN

Public health officials and physicians representing sixteen counties in southern Wisconsin have planned to establish county mobile medical units which will operate out of wartime casualty stations to be established at key points. One of the complete units was shown at a meeting in Madison, April 6. The unit was equipped with bandages, tourniquets, flashlights, medicines, a stove and other equipment for emergency first aid treatment.

### TRAINING NURSES' AIDES IN NEW YORK

Eight hundred and ten women had completed training as volunteer nurses' aides in New York City as of April 13, 1,031 were in training and 295 were waiting for class instruction. According to the *New York Times*, a campaign is under way to train 10,000 women as volunteer nurses' aides. Bellevue Hospital, which alone can use more than 300, is one of eighty-four hospitals needing nurses' aides. A survey conducted at Bellevue by the director of volunteer service, Miss Lois Mills, disclosed that women from 30 to 50 years of age are best equipped to fill these posts. In the campaign to obtain nurses' aides, 400 women were interviewed and accepted for service the second week in April.

### VIRGINIA ORGANIZES EVACUATION HOSPITAL

Arrangements are practically complete for Evacuation Hospital No. 8, being organized by the University of Virginia Department of Medicine, Charlottesville, under the direction of Dr. Staige D. Blackford of the faculty of medicine. A unit is being organized for foreign service, according to the *Richmond Times Dispatch*. In the first world war the University of Virginia Unit, Base Hospital No. 41, served in France.

## THE ATLANTIC CITY SESSION

AMERICAN MEDICAL ASSOCIATION, NINETY-THIRD ANNUAL SESSION

ATLANTIC CITY, JUNE 8 12, 1942

### OFFICIAL CALL

#### TO THE OFFICERS, FELLOWS AND MEMBERS OF THE AMERICAN MEDICAL ASSOCIATION

The ninety-third annual session of the American Medical Association will be held in Atlantic City, June 8-12, 1942

The House of Delegates will convene at 10 a m Monday, June 8 In the House the representation of the various constituent associations for 1941, 1942 and 1943 is as follows

|                      |   |                     |    |
|----------------------|---|---------------------|----|
| Alabama              | 2 | New Hampshire       | 1  |
| Arizona              | 1 | New Jersey          | 5  |
| Arkansas             | 2 | New Mexico          | 1  |
| California           | 8 | New York            | 19 |
| Colorado             | 2 | North Carolina      | 3  |
| Connecticut          | 2 | North Dakota        | 1  |
| Delaware             | 1 | Ohio                | 7  |
| District of Columbia | 1 | Oklahoma            | 2  |
| Florida              | 2 | Oregon              | 1  |
| Georgia              | 3 | Pennsylvania        | 11 |
| Idaho                | 1 | Rhode Island        | 1  |
| Illinois             | 9 | South Carolina      | 2  |
| Indiana              | 4 | South Dakota        | 1  |
| Iowa                 | 3 | Tennessee           | 2  |
| Kansas               | 2 | Texas               | 5  |
| Kentucky             | 3 | Utah                | 1  |
| Louisiana            | 2 | Vermont             | 1  |
| Maine                | 1 | Virginia            | 2  |
| Maryland             | 2 | Washington          | 2  |
| Massachusetts        | 6 | West Virginia       | 2  |
| Michigan             | 5 | Wisconsin           | 3  |
| Minnesota            | 4 | Wyoming             | 1  |
| Mississippi          | 2 | Alaska              | 1  |
| Missouri             | 4 | Hawaii              | 1  |
| Montana              | 1 | Isthmian Canal Zone | 1  |
| Nebraska             | 2 | Philippine Islands  | 2  |
| Nevada               | 1 | Puerto Rico         | 1  |

The sixteen scientific sections of the American Medical Association, the Medical Corps of the Army, the Medical Corps of the Navy and the Public Health Service are entitled to one delegate each

The Scientific Assembly of the Association will open with the general meeting, to be held at 8 p m Tuesday, June 9 The sections will meet Wednesday, Thursday and Friday, June 10, 11 and 12, as follows

| CONVENING AT 9 A M THE SECTIONS ON     |                                  |
|--|----------------------------------|
| Surgery, General and Abdominal         | Dermatology and Syphilology      |
| Ophthalmology                          | Gastro-Enterology and Proctology |

## ATLANTIC CITY

## INFORMATION ABOUT THE CONVENTION PLANS AND THE CONVENTION CITY

The thousands of doctors and their wives who have attended previous sessions in Atlantic City need little encouragement to make them want to visit Atlantic City again.

The city's convention facilities are the best in the country. Past performances show that Atlantic City presents the finest convention facilities both from business and from entertainment points of view.

THE JOURNAL has carried many previous stories telling of the resort's natural attractions and its many made diversions. With the country at war this year it is necessary to throw a somewhat different light on the picture. Here are answers to some of the questions which have probably come to mind as plans have been made to attend the session.

It any of the thousands who are making arrangements to go to Atlantic City expect to find war's excitements they will be disappointed. There is plenty of excitement but not of the war variety. The only evidence of the military is in the uniforms of the men with their wives on week end furloughs.

A close inspection of the beach for evidence of barbed wire entanglements, guns or trenches reveals only a wide smooth strand, 8 miles long on which sun seekers rest in the beach chairs or on the beach itself. There will also be found the usual bathers out to get a coat of tan.

The Boardwalk lights are somewhat dimmer. Like other cities Atlantic City has a well organized civilian defense army.

Atlantic City would like to be able to boast that it has a host of defense industries turning out war materials for the armed forces but there just aren't any there. The resort makes its contribution by providing health and entertainment for those who are closely allied with the all out effort.

There are no priorities on sunshine or recreation and even if there were this greatest of all resorts is well supplied. Consequently, Atlantic City its hotels, large and small its many theaters, its auditoriums, its Boardwalk, its beach, its ocean, its golf courses, its cottages and rooming houses and all its hundred and one other features are combining to make a contribution toward national defense. They've signed a pledge to do everything possible to make an estimated fifteen million visitors hale Americans during 1942.

The great Municipal Convention Hall, world's largest, which in the past has provided such a fine setting for the convention sessions will again be the center of activities. The many exhibits will be seen in the huge main arena and in the lower hall, the larger meetings will be held in the ball room seating five thousand three hundred with many committee rooms set aside for smaller meetings.

Fine highways lead into the resort from Philadelphia and New York for those who plan to motor in, while fast trains and busses are available for others. Transportation is no problem once one arrives in Atlantic City as all the hotels are within walking distance of the convention hall. Those who prefer to ride will find the taxi rates reasonable with jitneys running along Pacific Avenue and trolley cars on Atlantic Avenue the city's two principal streets.

There are also some two thousand rolling chairs ready to carry sightseers along the Boardwalk at a leisurely pace. Special rates will be granted those wearing convention badges. This is just one of the many things that are being done to make the visit to Atlantic City more enjoyable. Those who go there for the first time will be glad to add their voices to those of the others in singing the praises of the famous seashore metropolis as the nation's number 1 convention city.

## SOMEWHAT HISTORICAL

Atlantic City, ninety-third meeting place of the American Medical Association, is situated on Absecon Island between Great Egg Harbor and Absecon inlets on the New Jersey coast.

The name Absecon is a corruption of the real Algonquian Indian name Absconum which designated the bay which lies between Atlantic City and the mainland. Absc is the common Algonquian word for 'small' or 'little'. Kitchi in the Indian tongue, means 'great' and Lake Superior for instance, was known to the Indians as Kitchi gami—the 'great water'. The true Indian etymology of Absecon Island therefore is Absc gami meaning 'little water' and refers to the smooth salt water lake inside the sand bar on which Atlantic City is built. Present day Absecon is merely a more euphonious corruption of the original Indian 'little water'—Absconum.

## THE CONVENTION HALL

Modern Atlantic City is America's greatest resort investment. It is also the prototype convention city. Beautiful hotels, bizarre in color and form stand at the very edge of the surf their loftiness sharply accented against the clear, smokeless sky. The Atlantic City skyline is one of America's dramatic architectural spectacles as it rises majestically from the ocean's edge. To its distinction as the world's greatest health and pleasure resort Atlantic City has also added the honor of possessing the largest convention hall.

The Atlantic City convention hall is literally colossal in its proportions covering an area of 7 acres. It is 350 feet wide by 650 feet deep, and the main auditorium has a seating capacity of forty-one thousand. The floor of the main auditorium is 168,000 square feet in area, while an additional space of 96,000 square feet is provided on the ground floor. Adjacent to the main auditorium and fronting the Boardwalk is another large hall with a seating capacity of five thousand three hundred. The main auditorium houses the world's largest pipe organ, and some idea of the immensity of this auditorium may be gained from the fact that a fourteen story building could be erected within its walls. In season football is played regularly in this mammoth hall on a regulation playing field.

Physicians who attended the 1935 and 1937 Atlantic City sessions of the Association will recall the convenient arrangement of all meetings and exhibits in Convention Hall. This year, however, the facilities of this splendid building will be used to even better advantage. Three large new meeting rooms each well lighted and ventilated, will make it possible for all of the nine sections to meet simultaneously in Convention Hall. In addition, a much enlarged area will this year be occupied exclusively by the Scientific Exhibit. The Technical Exhibit will be located on the arena floor and all meetings, including the general sessions, will be held in rooms immediately adjacent to the Scientific and Technical exhibits.

In view of prevailing conditions, it is likely that many doctors will avail themselves of the opportunity to combine a family holiday with their attendance at the annual meeting. Atlantic City's hotels are comfortable and from every standpoint are recognized as among the best. Hotel rooms are large and most of them overlook the sea. Lobbies and sun decks are spacious and colorful. All hotels are convenient to Convention Hall.

## DIVERSION

Apart from the many reunions and other social gatherings that are a delightful perennial feature of every A. M. A. convention Atlantic City itself offers a variety of wholesome diversion. The rolling chair, for instance is indigenous to the Boardwalk. Patrons of this unique form of transportation experience a decided "lift" as they move noiselessly along the miles of surf girded walk. The deep sea net haul and the amusement piers are also distinctly Atlantic City. But the quality that "types" Atlantic City and makes it attractive to fifteen million visitors each year is the all pervading atmosphere of seaside serenity and calm that prevails on the Boardwalk and in the hotels, theaters and restaurants. This desirable quality is achieved largely through the complete absence of automobiles on the Boardwalk—no traffic noises or gasoline fumes. Likewise there is no smoke nor dirt—there are no industries.

PANORAMA OF THE BOARDWALK IN ATLANTIC CITY SHOWING BOARDWALK HOTEL

Certain facts about Atlantic City will be of special interest to the physician. Its water supply, for instance comes mainly from artesian wells. In fact each large hotel has its own wells supplying pure cold fresh water drawn from a stream 1200 feet below the salty sea.

Another fact of more than passing interest is Atlantic City's geographic location. It is below the Mason and Dixon line

and, although it fronts on the Atlantic Ocean, it faces almost directly south. Its main axis, the Boardwalk, parallels the ocean yet runs almost due east and west. The prevailing breeze is southwest—clean, fresh and ozone laden from the sea.

Atlantic City is different. Although many have tried to define this difference, Atlantic City must be experienced to be fully appreciated.

## REGISTRATION

The Bureau of Registration will be located at the north end of Technical Exhibition Hall in Convention Hall, Boardwalk between Georgia and Mississippi avenues. Members of the Subcommittee on Registration of the Local Committee on Arrangements will be on hand to assist those who desire to register. A branch postoffice in charge of government post-office officials will be available for visitors, and an information bureau will be operated in connection with the Bureau of Registration.

### Who May Register

Only Fellows Affiliate, Associate and Honorary Fellows and Invited Guests may register and take part in the work of the sections. Fellows of the Scientific Assembly are those who have, on the prescribed form, applied for Fellowship, subscribed to *THE JOURNAL* and paid their Fellowship dues for the current year. Fellowship dues and subscription to *THE JOURNAL* are included in the one annual payment of \$8, which is the regular subscription price of *THE JOURNAL*. Fellowship cards are sent to all Fellows after payment of annual dues and these cards should be presented at the registration window. Any who have not received cards for 1942 should secure them at once by writing to the American Medical Association, 535 North Dearborn Street, Chicago.

### Members in Good Standing Eligible to Apply for Fellowship in the Association

Members in good standing in the American Medical Association are those members of component county medical societies and of constituent state and territorial medical associations whose names are officially reported for enrolment to the Secretary of the American Medical Association by the secretaries of the constituent medical associations. All members in good standing may apply for Fellowship in the Scientific Assembly and are urged to qualify as Fellows before leaving home in order that pocket cards may be secured and brought to Atlantic City so that registration can be more easily and more promptly effected.

Application forms may be had on request.

Those subscribers to *THE JOURNAL* who have not received pocket cards for 1942 should write to the American Medical

Association in order to obtain application blanks and information as to further requirements.

### Register Early

Fellows living in Atlantic City, as well as all other Fellows who are in Atlantic City on Monday and Tuesday, should register as early as possible.

The names and local addresses of those who register will be included in the issue of the *Daily Bulletin* appearing the next day, and this will enable visiting physicians to find friends who have registered.

### Suggestions That Will Facilitate Registration

Fellows should fill out completely the spaces on both sections of the front of the *white* registration card, which will be found on the tables in front of the Registration Bureau.

Physicians who desire to qualify as Fellows should fill out completely the spaces on both sections of the front of the *blue* registration card and sign the application on the back. These cards will be found on the tables.

Entries on the registration card should be written plainly, or printed, as the cards are given to the printer to use as "copy" for the *Daily Bulletin*, which appears on Tuesday, Wednesday, Thursday and Friday mornings during the week of the session.

Fellows who have their pocket cards with them can be registered with little or no delay. They should present the filled out *white* registration card, together with the pocket card, at one of the windows marked "Registration by Pocket Card." There the clerk will compare the two cards, stamp the pocket card and return it and supply the Fellow with a badge, a copy of the official program and other printed matter of interest to those attending the annual session.

As previously stated, it will assist in registering if those who desire to qualify as Fellows will file their application and qualify as Fellows by writing directly to the American Medical Association, 535 North Dearborn Street, Chicago so that their Fellowship may be entered not later than May 10. Any applications that are received later than May 10 will be given prompt attention, but the Fellowship pocket card may

CONVENTION AUDITORIUM IS LOCATED AT A CONVENIENT DISTANCE FROM MOST OF THE LARGE HOTELS

not reach the applicant in time for him to register at the Atlantic City session

It will be possible for members of the organization to qualify as Fellows at Atlantic City. In order to do this applicants for Fellowship will be required to fill out both sections of the front of the blue registration card and to sign the formal application that is printed on the reverse side of the card. It is suggested that those members who apply for Fellowship at Atlantic City bring with them their state membership cards for the year 1942. The state membership card should be presented along with the filled in blue registration card at the window in the booth marked "Applicants for Fellowship and Invited Guests"

As already stated registration can be effected more easily and more promptly if members will qualify as Fellows before leaving home

### Registration for General Officers and Delegates at Hotel Traymore

General Officers of the American Medical Association and members of the House of Delegates may register for the Scientific Assembly outside the American Room of the Hotel Traymore. This arrangement is made for the convenience of the members of the House of Delegates which will convene on Monday morning at 10 o'clock in the American Room of the Hotel Traymore. Delegates are requested to register for the Scientific Assembly before presenting credentials to the Reference Committee on Credentials of the House of Delegates. Registration of delegates for the Scientific Assembly will begin at 8 o'clock Monday morning June 8 and delegates are urged to register early so that all members of the House of Delegates may be seated in time for the opening session of the House.

## TRANSPORTATION

### Railroad Rates to Atlantic City

Because of the reduction in one way fares effective June 1, 1936 the use of convention fares has been discontinued in the territories of railway passenger associations.

In the territory of the Central Passenger Association and in that of the Trunk Line Association the fares vary for travel in sleeping or parlor cars and in coaches. The suggestion is offered that members of the Association traveling to Atlantic City from the territories of the Central Passenger and Trunk Line associations consult their ticket agents a week or so in advance of the time at which they expect to start to Atlantic City for the exact rates that will be in effect then, not only for individuals but also for parties that may be traveling together.

In the territory of the Southern Passenger Association low round trip fares are in effect to Atlantic City for travel in sleeping or parlor cars on payment of usual charges for space occupied with return limit of thirty days in addition to date of sale. If a longer limit than thirty days is desired, tickets with six months limit may be obtained at reduced fares on a slightly higher basis. Moreover, reduced fares are in effect on a slightly lower basis from all points in the Southern Passenger Association territory to Atlantic City for tickets which are good for transportation in coaches and which bear a limit of fifteen days in addition to the date of sale. Local ticket agents will be able to furnish more complete information at the time tickets are purchased.

In the territory of the Southwestern Passenger Association daily round trip fares are in effect to Atlantic City on the basis of fare and one half of the one way fare to its gateways added to the reduced fares of Southern Passenger, Central Passenger and Trunk Line associations tickets at these fares

offering limit of sixty days in addition to date of sale. Six month limit tickets may also be obtained at slightly higher fares the usual charges being made for space occupied in sleeping and parlor cars. Lower fares are available to those desiring to travel in coaches. The suggestion is offered that members of the Association traveling from points in the territory of the Southwestern Passenger Association consult their local ticket agents for details of arrangements that apply from starting points.

In the territory of the Trans-Continental and Western Passenger associations low round trip fares will be in effect daily for travel in sleeping and parlor cars on the payment of the usual charges for the space which is occupied. In a part of these territories low intermediate class fares, good for transportation in tourist sleeping cars, will also be available on the payment of charges for the space occupied.

In the territory of the Canadian Passenger Association in addition to one way tickets round trip tickets may be purchased which are computed on the basis of a rate 10 per cent less than double the rate for one way fares, which bear a limit of six months from the date of sale and which are available for stop over privileges. Moreover, summer or other reduced fares are in effect during certain parts of the year, details of which are available on application to any railway agent.

For information regarding specific fares and the most advantageous arrangements from starting points, all members who expect to attend the annual session in Atlantic City are urged to consult their local ticket agents.

### Air Travel

Your nearest Airline Ticket Office, Travel Bureau or Hotel Transportation Desk will gladly give information regarding air travel and arrange your itinerary.

## Local Transportation

Trolley cars operate the entire length of the Island on Atlantic Avenue, which parallels the Boardwalk, and the fare is 7 cents.

Taxicabs operate the entire length of Pacific Avenue, which parallels the Boardwalk, and the fare is 10 cents.

Taxis operate at the rate of 50 cents for one person, 75 cents for two persons and 10 cents for each additional person.

Persons with convention badges will be entitled to a special rate for the rolling chairs on the Boardwalk. Between the Seaside Hotel and Convention Hall or between the Chelsea Hotel and Convention Hall in either direction, the charge will be 50 cents for one, two or three passengers. This rate is for a direct trip to or from the Convention Hall only.

It is suggested that prospective attendants to the Atlantic City session secure transportation prior to May 15.

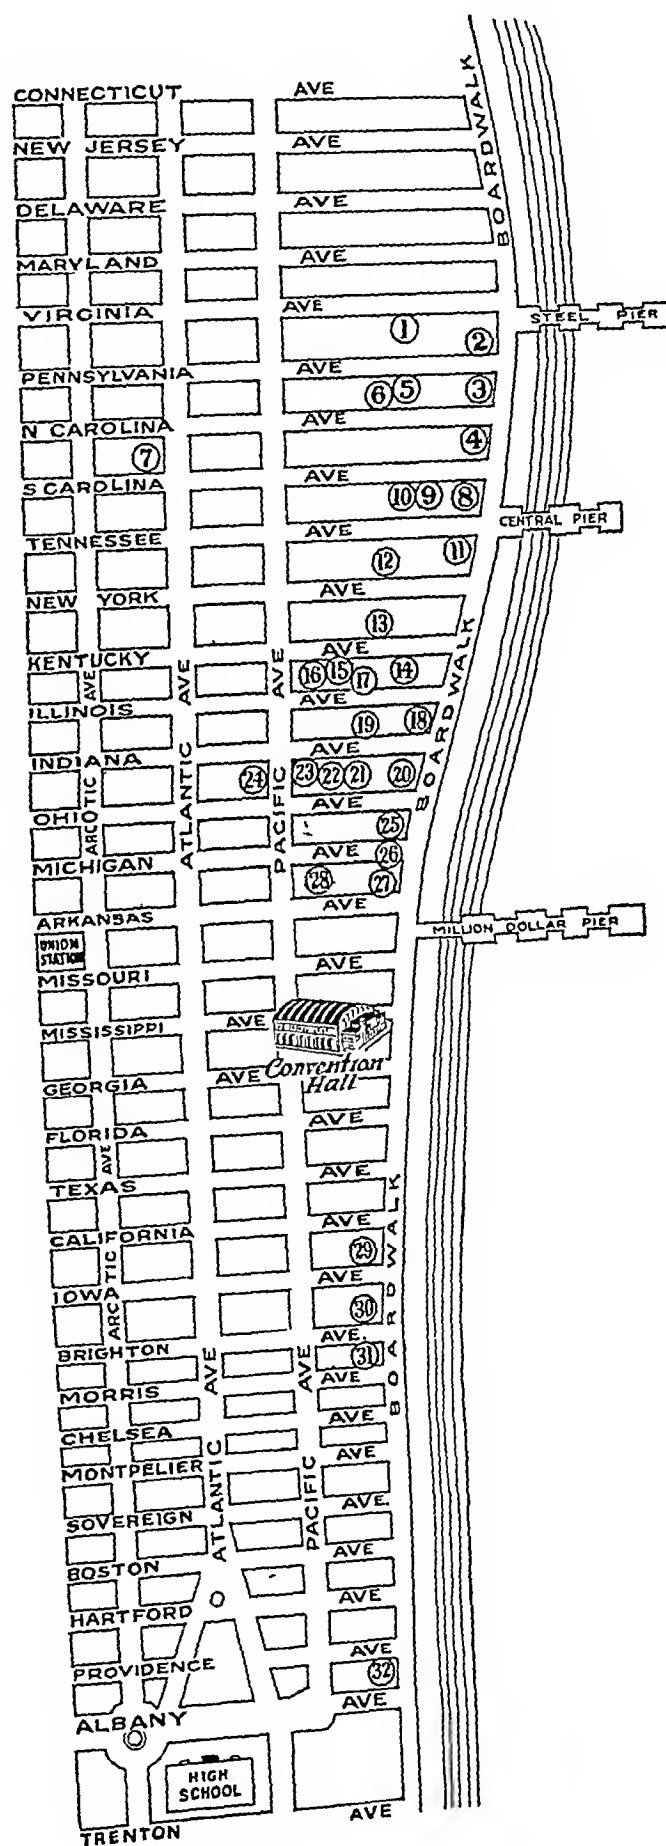

## ATLANTIC CITY HOTELS AND MAP

A list of Atlantic City hotels is presented for the benefit of those who expect to attend the annual session of the American Medical Association, June 8-12. Dr. V. Earl Johnson is chairman of the Subcommittee on Hotels of the Local Committee on Arrangements and may be addressed at 16 Central Pier, Atlantic City, N. J. The advertising announcement and a coupon to be used for making reservations appear on advertising page 108 of this issue.

Since reservations are cleared through the subcommittee on hotels, it will greatly expedite matters if requests for reservations are addressed directly to Dr. Johnson, who, as stated, may be reached at 16 Central Pier, Atlantic City, N. J.

## Schedule of Rates

| BOARDWALK HOTELS |  | European Plan |                |

## WOMAN'S AUXILIARY

The Chairman of the Committee on Local Arrangements of the Woman's Auxiliary, Mrs David B Allman, and the hostesses the Woman's Auxiliary to the County Medical Society and the Woman's Auxiliary to the Medical Society of New Jersey extend a most cordial invitation to all women who are auxiliary members or guests of physicians attending the annual session to participate in all social functions and to attend the general sessions. Whether auxiliary members or not wives of doctors will be most welcome.

Auxiliary headquarters will be on the Lounge Floor of Haddon Hall. All meetings and functions will be held at Haddon Hall unless otherwise stated in the program. Please register early and obtain your badge and program of the sessions and social functions.

All tickets should be purchased soon after arrival. Members of the Hospitality and the Information Committees will be at the hotels and at the guests' registration desk at Convention Hall. Committee members will gladly help plan for an interesting visit in Atlantic City. Tickets will be sold only at auxiliary headquarters in Haddon Hall. All meetings and social affairs will begin at the time scheduled. Please be prompt.

Registration hours are from 11 a m to 4 p m Sunday, June 7 and 8 30 a m to 4 p m Monday, June 8 through Friday, June 12. Auxiliary members may register only at headquarters in Haddon Hall. Guests may register at headquarters or at the woman's registration desk in Convention Hall.

- Monday, June 8, 2 p m, Ball Room, Convention Hall
- 2 00 p m The Influence of Anoxemia on Hepatopoietic Activity *AMIRIO HURTADO, Lima, Peru*
- 2 30 p m Manson's Schistosomiasis  
*ENRIQUE KOPPISCH, San Juan, Puerto Rico*
- 3 00 p m Lymphoid Myocarditis Its General Conception and Treatment  
*ENRIQUE SALADRIAS ZAYAS Havana, Cuba*
- 3 30 p m Aviation Medicine in the Royal Canadian Air Force  
*G F HALL, Ottawa, Canada*
- 4 00 p m Address *IGNACIO CHAVEZ Mexico City, Mexico*
- 4 30 p m The Clinical Consideration of the Chemical Mechanisms Underlying the Formation of Urinary Calculi  
*JOHN MCINTOSH, Montreal, Canada*

## Tuesday, June 9, 9 30 a m, Ball Room, Convention Hall

- 9 30 a m Selective Service and the Medical Profession in Total War  
*LEWIS B. HIRSHEY, Washington, D C*
- 10 00 a m The Venereal Disease Problem  
*C S STEPHENSON, Washington D C*
- 10 30 a m Progress in the Army's Fight Against Malaria  
*JAMES S. SIMMONS, Washington, D C*
- 11 00 a m Sylvatic Plague of Today and Tomorrow  
*KARI F MEYER San Francisco*
- 11 30 a m The Present Status of the Influenza Problem  
*FRANK L. HORSFALL, New York*
- 12 00 m The Effects of the Sulfonamide Drugs on the Blood  
*ROY R. KRACAR, Emory University, Ga*

## Tuesday, June 9, 2 p m, Ball Room, Convention Hall

- 2 00 p m The Role of Physical Therapy in the Rehabilitation of Disabled Soldiers  
*RALPH PIMBERTON, Philadelphia*
- 2 30 p m Studies in Hypertension  
*IRVING H. PAGE, Indianapolis*
- 3 00 p m Newer Knowledge of Epilepsy  
*WILLIAM GORDON LENNON, Boston*
- 3 30 p m Painful Backs The Diagnosis and Treatment  
*PHILIP LEWIN, Chicago*
- 4 00 p m An Evaluation of the Kenny Treatment of Polio-myelitis  
*W H COLE, St Paul*

## THE OPENING GENERAL MEETING

Ball Room, Second Floor, Convention Hall

Tuesday, June 9—8 p m

- Music *MISS LOIS MILLER at the Console*
- Introduction of the President, *FRANK H LAHEY* *ROBERT A BRADLEY, President, Atlantic County Medical Society*
- Call to Order by the President, *FRANK H LAHEY*
- Presentation of Colors
- Our National Anthem
- Invocation *REV GEORGE W LAWRENCE*
- Welcome from Medical Profession of New Jersey *ELIAS J MARSH, President, Medical Society of New Jersey*
- Welcome to Atlantic City  
*HON THOMAS D TAGGART JR, Mayor of Atlantic City*  
*HON CHARLES EDISON, Governor of New Jersey*
- Music

Announcements *WILLIAM J CARRINGTON, Chairman, Local Committee on Arrangements*

Introduction of Distinguished guests

Introduction and Installation of President-Elect *FRED W RANKIN, Lexington, Ky*

Address *FRED W RANKIN, President*

Presentation of Medal to Retiring President *FRANK H LAHEY*  
*ARTHUR W BOOTH, Chairman of the Board of Trustees*

Presentation of Distinguished Service Medal *FRED W RANKIN, President*

Benediction *RT REV MONSIGNOR MAURICE R SPILLANE*

## THE PROGRAMS OF THE SECTIONS

Outline of the Scientific Proceedings—The Preliminary Program and the Official Program

The following papers are announced to be read before the various sections. The order here is not necessarily the order that will be followed in the Official Program, nor is the list complete. The Official Program will be similar to the programs issued in previous years and will contain the final program of each section with abstracts of the papers, as well as lists of committees, program of the Opening General Meeting, list of entertainments, map of Atlantic City and other information. To prevent misunderstandings and protect the interest of advertisers, it is here announced that this Official Program will contain no advertisements. It is copyrighted by the American Medical Association and will not be distributed before the session. A copy will be given to each Fellow on registration.

## SECTION ON PRACTICE OF MEDICINE

MEETS IN BALL ROOM, SECOND FLOOR, CONVENTION HALL

## OFFICERS OF SECTION

- Chairman—*ROY W SCOTT, Cleveland*
- Vice Chairman—*G K FENN, Chicago*
- Secretary—*W D STROUD, Philadelphia*
- Executive Committee—*WILLIAM S McCANN, Rochester, N Y*  
*FRED M SMITH, Iowa City, ROY W SCOTT, Cleveland*

## Wednesday, June 10—2 p m

The Effect of Meat and Meat Fractions on the Fatty Liver of Denervated and Pancreatic Duct Ligated Dogs (Lantern Demonstration)

*ELAINE P RALLI and SAUL H RUBIN, New York*

Insulin Resistance in Diabetes Mellitus in Man (Lantern Demonstration) *JAMES A GREENE, Iowa City*

Bilhings Lecture Advances in the Diagnosis and Treatment of Pancreatic Disease (Lantern Demonstration)  
*JOSEPH H PRATT, Boston*

The Role of Estrogenic Substances in the Management of Diabetes (Lantern Demonstration)  
*JOSEPH T BEARDWOOD JR, Philadelphia*

Etiology of Peptic Ulcer *RUSSELL S BOLFS, Philadelphia*

## Thursday, June 11—2 p m

## Election of Officers

Modern Treatment of Pneumococcal Pneumonia (Lantern Demonstration)

*HARRISON F FLIPPIN, LEON SCHWARTZ and ALBERT H DOMM, Philadelphia*

Discussion to be opened by *ADOLPH S RUMRICH, Chicago*

Chairman's Address (Lantern Demonstration)  
*ROY W SCOTT, Cleveland*

- Sulfonamide Toxicity as a Cause of Death in New York City in 1941 (Lantern Demonstration)  
W D SUTLIFF and MILTON HILPERN New York  
Discussion to be opened by PERRIN H LONG Baltimore and RUSSELL L CECIL New York
- Psychosomatic Studies in Hypertension (Lantern Demonstration)  
EDWARD WEISS Philadelphia
- Intrathoracic Tumors (Lantern Demonstration)  
FRANK S DORLEY Los Angeles

Friday, June 12—9 a m

JOINT MEETING WITH SECTION ON EXPERIMENTAL MEDICINE  
AND THERAPEUTICS IN SECTION ROOM 1 FIRST  
FLOOR CONVENTION HALL

- Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Its Pharmacologic and Therapeutic Action in Man (Lantern Demonstration)  
IRVING S WRIGHT and ANDREW G PRANDONI New York
- Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Experimental Studies (Lantern Demonstration)  
JESSE L BOLLMAN and F W PRESTON Rochester Minn
- Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Clinical Studies (Lantern Demonstration)  
EDGAR A ALLEN NELSON W BARKER and JOHN M WALGH, Rochester, Minn  
Discussion on papers of DRS WRIGHT and PRANDONI DRS BOLLMAN and PRESTON and DRS ALLEN, BARKER and WALGH to be opened by SHEPARD SHIMIZU, New York, and K K CHEN, Indianapolis
- Address (Lantern Demonstration)  
IGNACIO CHAVEZ Mexico City Mexico
- The Response of Experimental and Clinical Gallbladder Infections to Sulfonamide Compounds (Lantern Demonstration)  
LESTER M MORRISON WILLIAM A SWALM, W EMERY BLUNETT, FRANK W KONZELMANN and EARLE H SPAULDING, Philadelphia
- An Analysis of the Operative Treatment of Patent Ductus Arteriosus (Lantern Demonstration)  
M J SHAPIRO and ANCEL B KEYS Minneapolis
- Discussion of Electrocardiograms (Lantern Demonstration)  
HOWARD B SPRAGLE Newport R I, and HAROLD E B PARDEE New York

## SECTION ON SURGERY, GENERAL AND ABDOMINAL

MEETS IN SECTION ROOM C, FIRST FLOOR CONVENTION HALL

### OFFICERS OF SECTION

- Chairman—ARTHUR W ALLEN Boston  
Vice Chairman—WILLIAM L ESTES JR, Bethlehem Pa  
Secretary—ALTON OCHSNER New Orleans  
Executive Committee—THOMAS M JOYCE Portland Ore, LLOYD NOLAN Fairfield, Ala ARTHUR W ALLEN Boston

Wednesday, June 10—9 a m

- Succinyl Sulfathiazole as an Adjuvant in Surgery of the Large Bowel (Lantern Demonstration)  
EDGAR J POTH Baltimore  
Discussion to be opened by SAMUEL C HARVEY New Haven Conn, and JOHN S LOCKWOOD Wynnewood, Pa
- Lesions of the Right Colon Involving Right Colectomy  
FRANK H LAHEY Boston
- Resection and Immediate Anastomosis for Carcinoma of the Colon (Lantern Demonstration)  
HARVEY B STONE and SAMUEL McLANAHAN Baltimore  
Discussion on papers of DR LAHEY and DRS STONE and McLANAHAN to be opened by C W MAYO Rochester Minn HENRY W CAVE New York and ARTHUR W ALLEN Boston

- Complications of the Combined Abdominoperineal Operation Based on Over Five Hundred Cases (Lantern Demonstration)  
THOMAS E JONES Cleveland  
Discussion to be opened by FRIDRICK A COFFEY Ann Arbor, Mich and I PARKER HAYDEN Boston

- Experimental and Clinical Studies of Intestinal Motility and Postoperative Distention (Lantern and Motion Picture Demonstration)  
CHARLES B PLESTOW, Chicago  
Discussion to be opened by J PAUL NORTH Philadelphia and C G JOHNSTON Detroit

- The Prevention of Liver Damage and the Facilitation of Repair in the Liver by Diet (Lantern Demonstration)  
I S RADIN Philadelphia  
Discussion to be opened by ALLEN O WHITTE, New York and WALTER L LEE, Philadelphia

Thursday, June 11—9 a m

- The Prevention of Pulmonary Complications Following Thigh Amputations by High Ligation of the Femoral Vein (Lantern Demonstration)  
I ROSS VEA, Washington, D C

- Pulmonary Embolism A Clinical and Experimental Study (Lantern Demonstration)  
W J POTTS, Oak Park, Ill  
Discussion on papers of DR VEA and DR POTTS to be opened by GIZA M TAKATS Chicago and FRANK THIELS, Chicago and E A ALLEN, Rochester, Minn

- Chairman's Address Subtotal Gastrectomy for Stenosing Duodenal Ulcer (Lantern and Motion Picture Demonstration)  
ARTHUR W ALLEN, Boston

- Management of Skull Fractures and Brain Injuries (Lantern Demonstration)  
HARRY E MOCK and HARRY E MOCK JR, Chicago

- Discussion to be opened by MAX M PEFT Ann Arbor, Mich and FRED M DOUGLASS Toledo, Ohio

- Pulsating Exophthalmos (Lantern Demonstration)  
J D MARTIN JR, Atlanta Ga

- Discussion to be opened by HARRY H KERR, Washington D C and MICHAEL E DEBAKEY, New Orleans

- Blast Injuries to the Lungs (Lantern Demonstration)  
GEORGE M CURTIS, Columbus Ohio

- Discussion to be opened by CASPER F HEGNER Denver

- Panhysterectomy A Consideration of a New Operative Technique (Lantern Demonstration)  
HAROLD L FOSS, Danville Pa

- Discussion to be opened by JAMES C MASSON, Rochester, Minn, and CONRAD G COLLINS New Orleans

Friday, June 12—9 a m

### Election of Officers

- Classification of Primary Cases of Cancer of the Breast (Lantern Demonstration)  
U V PORTMANN, Cleveland
- The Role of Surgery and Radiation in Cancer of the Breast (Lantern Demonstration)  
FRANK E ADAIR New York

- Discussion on papers of DR PORTMANN and DR ADAIR to be opened by SHIELDS WARREN, Boston and C D HAACENSEN and WILLIAM C WHITE New York

- Acute Protein Deficiency in Shock, Burns, Intestinal Obstruction and Peritonitis (Lantern Demonstration)  
ROBERT ELMAN, St Louis

- Discussion to be opened by ALEXANDER BRUNSCHWIG Chicago and H N HARKINS, Detroit

- Acute Cholecystitis (Lantern Demonstration)  
ELLIOTT C CUTLER and ROBERT ZOLLINGER, Boston

- Discussion to be opened by FRANK GLEN, New York, and HENRY F GRAHAM Brooklyn

- Is the Asthmatic Patient a Good Surgical Risk (Lantern Demonstration)  
F W GAARDE L E PRICKMAN and H J RASZKOWSKI Rochester, Minn

- Discussion to be opened by L N GAY Baltimore

- Intraspinal Administration of Ammonium Sulfate  
WILLIAM BATES, Philadelphia

- Discussion to be opened by ROBERT A GROFF, Philadelphia and JACOB GOFFLER Irvington N J

Nicotine Excretion in Breast Milk and Urine from Cigaret Smoking, Its Effect on Nursing (Lantern Demonstration)

A. M. DANNENBERG and H. HARRIS PRIMAN, Philadelphia

Management of Male Pubescence (Lantern Demonstration)

WILLIAM A. SCHONITZ, New York

Friday, June 12—9 a m

JOINT MEETING WITH SECTION ON LARYNGOLOGY,  
OTOLOGY AND RHINOLOGY

Bronchiectasis and Sinusitis in Children Their Interrelationship and Treatment (Lantern Demonstration)

D. F. STANTON WISHART, Toronto, Canada

A Survey of Two Thousand Cases of Otitis Media and Mastoiditis in Children (Lantern Demonstration)

ADOLPH G. DI SANCTIS, New York

Atypical Laryngeal and Vocal Changes in Adolescence

JAMES SONNITT GREENE, New York

Fractures and Dislocations of the Outer and Inner Nasal Framework in Infants and Young Children and Orthopedic Methods for Their Correction (Lantern Demonstration)

MYRON I. MITZENBAUM, Cleveland

## SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

MEETS IN SECTION ROOM F, FIRST FLOOR,  
CONVENTION HALL

### OFFICERS OF SECTION

Chairman—WALLACE M. YATER, Washington, D. C.

Vice Chairman—JESSIE R. HARRISON, Winston-Salem, N. C.

Secretary—FRED A. ALLEN, Rochester, Minn.

Executive Committee—IRVING S. WRIGHT, New York, C. M. GILBER, Philadelphia, WALLACE M. YATER, Washington, D. C.

Wednesday, June 10—9 a m

Prognosis in Hypertension

ROBERT M. DAVIS and HARRY E. UNGERLIDER, New York, and RICHARD S. GILNER, Brooklyn

The Causes and Prevention of Sudden Death in Coronary Disease (Lantern Demonstration) O. P. J. FAIR, St. Louis

Therapeutics of Pneumonia on a Statewide Basis (Lantern Demonstration) EDWARD L. BORTZ, Philadelphia

Effect of Gastric Resection on Gastric Acidity (Lantern Demonstration)

MORRIS T. FRIEDLI and C. M. SHAAR, Philadelphia

Observations on Renal Blood Flow and Glomerular Filtration Rate as Influenced by Environmental Temperature Changes (Lantern Demonstration)

GEORGE V. BAYFIELD and ROBERT W. KEETON, Chicago

Clinical Use of Amino Acids for the Maintenance of Nitrogen Equilibrium (Lantern Demonstration)

SAMUEL S. ALTSHULER, Detroit

Thursday, June 11—9 a m

### Election of Officers

Chairman's Address What's Wrong with Modern Therapeutics? WALLACE M. YATER, Washington, D. C.

Treatment of Asthma A Survey of the Value of Treatment During Twenty Years (Lantern Demonstration)

LEON UNGER and A. ALVIN WOLF, Chicago

Treatment of Anemia Associated with Uncorrected Vitamin Deficiency Beneficial Effects of Iron (Lantern Demonstration)

CARL V. MOORE, St. Louis, and RICHARD W. VILTER and TOM D. SPIES, Cincinnati

Discussion to be opened by M. M. WINTROBE, Baltimore

Treatment of Pain and Disability of Shoulder and Arm by Intramuscular Injection of Procaine Hydrochloride (Lantern and Motion Picture Demonstration)

JANET G. TRAVELL and SEYMOUR H. RINZLER, New York

Treatment of Syphilis with Clorarsen (Lantern Demonstration)

R. H. KAMPMEIER and H. B. HENNING, Nashville, Tenn.

Treatment of Arthritis with Vitamin and Endocrine Preparations Emphasis of Their Limited Value (Lantern Demonstration)

R. H. FREYBERG, Ann Arbor, Mich.

The Treatment of Portal Cirrhosis Physiologic Considerations (Lantern Demonstration) CARL H. GREENE, New York

Discussion to be opened by WILLIAM S. McCANN, Rochester, N. Y., and SEYMOUR J. GRAY, Chicago

Friday, June 12—9 a m

JOINT MEETING WITH SECTION ON PRACTICE OF MEDICINE

Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Its Pharmacologic and Therapeutic Action in Man (Lantern Demonstration)

IRVING S. WRIGHT and ANDREW G. PRANDONI, New York

Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Experimental Studies (Lantern Demonstration)

JESSIE L. BOITMAN and F. W. PRESTON, Rochester, Minn.

Dicoumarin [3,3'-Methylene-Bis-(4-Hydroxycoumarin)] Clinical Studies (Lantern Demonstration)

EDGAR V. ALLEN, NELSON W. BARKER and JOHN M. WALGH, Rochester, Minn.

Discussion on papers of DRS. WRIGHT and PRANDONI, DRS. BOITMAN and PRESTON and DRS. ALLEN, BARKER and WALGH to be opened by SHEPARD SHAPIRO, New York, and K. K. CHEN, Indianapolis

Address (Lantern Demonstration)

IGNACIO CHAVEZ, Mexico City, Mexico

The Response of Experimental and Clinical Gallbladder Infections to Sulfonamide Compounds (Lantern Demonstration)

LISTER M. MORRISON, WILLIAM A. SWALM, W. EMERY BURNETT, FRANK W. KONZELMANN and EARLE H. SPALDING, Philadelphia

An Analysis of the Operative Treatment of Patent Ductus Arteriosus (Lantern Demonstration)

M. J. SHAPIRO and ANCEL B. KEYS, Minneapolis

Discussion of Electrocardiograms

HOWARD B. SPRAGUE, Newport, R. I., and HAROLD E. B. PAROFF, New York

## SECTION ON PATHOLOGY AND PHYSIOLOGY

MEETS IN SECTION ROOM E, FIRST FLOOR,  
CONVENTION HALL

### OFFICERS OF SECTION

Chairman—J. P. SIMONDS, Chicago

Vice Chairman—FRANK C. MANN, Rochester, Minn.

Secretary—J. J. MOORE, Chicago

Executive Committee—FRANK W. HARTMAN, Detroit, CARL J. WIGGERS, Cleveland, J. P. SIMONDS, Chicago

Wednesday, June 10—2 p m

Chairman's Address Clinical Interpretation of Renal Pathology in Hypertension and Glomerulonephritis (Lantern Demonstration) J. P. SIMONDS, Chicago

Treatment of Experimental Renal Hypertension with Renin (Lantern Demonstration)

GEORGE E. WAKERLIN, Chicago

Effect of Splanchicectomy on Renal Blood Flow in Arterial Hypertension (Lantern Demonstration)

PIERO PIO FOA, WARD W. WOODS and MAX M. PEET, Ann Arbor, Mich.

Chronic Altitude Sickness ALBERTO HURTADO, Lima, Peru

Characteristics of Food Poisoning Outbreaks of Bacterial Origin GAIL M. DACK, Chicago

Irregular Isoagglutinins (Lantern Demonstration)

ISRAEL DAVIDSOHN, Chicago

Thursday, June 11—2 p m

### Election of Officers

Clinical Experiences with 3,3'-Methylene-Bis-(4-Hydroxycoumarin) (Lantern Demonstration)

WINFIELD L. BUTSCH, Buffalo

Experimental Studies Concerning Heparin (Lantern Demonstration)

DAVID I. MACHT, Baltimore

The Evaluation of Antiseptics

ALBERT C. HUNTER, Washington, D. C.

The Effects of Sulfonamide Drugs on the Blood (Lantern Demonstration)

ROY R. KRACKE, Emory University, Ga., and ELFVOR W. TOWNSEND, Atlanta, Ga.

Address

OLYMPIO DA FONSECA, Rio de Janeiro, Brazil

The Presence of Avirulent Tubercle Bacilli in Pulmonary Tuberculosis in Man (Lantern Demonstration)

HARRY J. CORFF, Denver

Pectin Intravenously (Lantern Demonstration)

FRANK W. HARTMAN, Detroit

Friday, June 12—9 a m

JOINT MEETING WITH SECTION ON GASTROENTEROLOGY  
AND PROCTOLOGY IN SECTION ROOM F FIRST  
FLOOR CONVENTION HALL

SIMPOSIUM ON LIVER

J P SIMONDS Chicago, Conducting

The Gastrointestinal Tract and the Liver  
FRANK C MANN Rochester Minn  
Liver Function Tests (Lantern Demonstration)

JOHN G MATTER Detroit  
The Significance of Mild Hyperbilirubinemia in Gastrointestinal  
Patients (Lantern Demonstration)  
THOMAS A JOHNSON and HENRY L BOCKUS Philadel-  
phia

The Clinical Prevention and Diagnosis of Liver Dysfunction  
(Lantern Demonstration) SIDNEY A PORTIS Chicago  
Cirrhosis of Liver (Lantern Demonstration)

ARCH H MOON Philadelphia  
Primary Carcinoma of the Liver (Lantern Demonstration)  
DWIGHT L WILBUR, DAVID A WOOD and FORREST M  
WILLETT, San Francisco

The Concept of Liver Deaths (Lantern Demonstration)  
CHARLES GORDON HEID New York  
Discussion on papers of DR MANN, DR MATTER, DR  
JOHNSON and BOCKUS, DR PORTIS, DR MOON, DR  
WILBUR, WOOD and WILLETT and DR HEID to be  
opened by CHESTER M JONES Boston and HOWARD T  
KARNER Cleveland

SIMPOSIUM ON GASTRITIS

WALTER L PALMER Chicago Conducting

Correlation of Gastroscopic and Pathologic Findings in Gastritis  
(Lantern Demonstration)

EDWARD B BENEDICT and TRACY B MALLORY Boston  
The Significance of Hemorrhagic or Pigment Spots as Observed  
by Gastroscopy (Lantern Demonstration)

JULIAN M RUFFIN Durham N C  
The Early Diagnosis of Carcinoma of the Stomach (Lantern  
Demonstration) C WILMER WIRTS Philadelphia  
Relation of Atrophic Gastric Mucosa to Carcinoma of the  
Stomach (Lantern Demonstration)

I R JANKELSON and C W MCCLURE Boston, and  
HARRY FREEDBERG Salem, Mass

Gastroscopic Observation in Duodenal Ulcer (Lantern Demon-  
stration)

J B CAREY and R S YLISAKER Minneapolis  
Discussion on papers of DRs BENEDICT and MALLORY,  
DR RUFFIN, DR WIRTS, DRs JANKELSON, MCCLURE  
and FREEDBERG and DRs CAREY and YLISAKER to be  
opened by SHIELDS WARREN, Boston and RUDOLF  
SCHINDLER, LEONIDAS H BERRY and LEO L J HARDT,  
Chicago

## SECTION ON NERVOUS AND MENTAL DISEASES

MEETS IN SECTION ROOM D, FIRST FLOOR,  
CONVENTION HALL

### OFFICERS OF SECTION

Chairman—STANLEY COBB Boston

Vice Chairman—A R VONDERAHE Cincinnati

Secretary—J M NIELSEN, Los Angeles

Executive Committee—PAUL C BLEY, Chicago TOM B  
THROCKMORTON, Des Moines, Iowa, STANLEY COBB Boston

Wednesday, June 10—9 a m

Chairman's Address (Motion Picture Demonstration)

STANLEY COBB, Boston

Critical Review of Shock Therapies (Lantern Demonstration)  
FRANKLIN G EBAUGH and CHARLES A RYMER Denver  
Discussion to be opened by HANS H REESE, Madison  
Wis and A E BENNETT Omaha

Conditioned Reflex Treatment of Chronic Alcoholism (Motion  
Picture Demonstration)

WALTER L VOEGTLIN, FREDERICK LEMERE WILLIAM R  
BROZ and PAUL F O'HOLLAREN, Seattle

Discussion to be opened by W E ASH Council Bluffs,  
Iowa and JAMES P KING, Radford Va

Personality Changes and Behavior Disorders of Children Due  
to Pertussis A Report Based on the Study of Five  
Hundred Problem Children LOUIS A LURIE Cincinnati  
Discussion to be opened by A R VONDERAHE, Cincinnati  
and S SPAFFORD ACKERLY Louisville Ky

Mesencephalic Tricotomy A Method for the Relief of Uni-  
lateral Intractable Pain (Motion Picture Demonstration)

A LARL WALKER Chicago

Discussion to be opened by FRANCIS C GRANT, Philadel-  
phia, and MAX M PIET, Ann Arbor Mich

Location of the Superior Longitudinal Sinus (Lantern and  
Motion Picture Demonstration)

J RUDOLPH JAEGER Denver

Discussion to be opened by JAMES L POLLEN, Boston  
and I W WATTS, Washington D C

Thursday, June 11—9 a m

### Election of Officers

Massive Hemorrhage into Brain Tumor Its Significance and  
Probable Relationship to Rapidly Fatal Termination and  
Antecedent Trauma

JOSEPH H GIBBS New York and MITTON R SAPER  
STEIN Bellerose N Y

Discussion to be opened by ELICH OLBIECH Chicago

Epidemiologic Studies of Encephalitis Eastern and Western  
Equine and St Louis Types, in Several Western States  
(Lantern Demonstration)

W MCD HANCOCK, San Francisco, and FREDERICK B  
BANC Princeton N J

Epidemic of Encephalitis of 1941

JAMES P IFAKE, Bethesda Md

Discussion on papers of DRs HANCOCK and BANC and  
DR LIANG to be opened by CARL TILBROECK Princeton  
N J

Physiologic and Pathologic Amoeboid Motions of Motor End  
Plates (Lantern and Motion Picture Demonstration)

ELLEN I CAREY, Milwaukee

Discussion to be opened by ARTHUR STEINDLER, Iowa  
City, and FRANK R OBER, Boston

Nontraumatic Effusions (Hygromas) of the Subdural Space as  
a Cause of Obscure Cerebral Symptoms (Lantern Demon-  
stration)

MICHAEL SCOTT, Philadelphia

Discussion to be opened by ERNEST A SPIEGEL Phila-  
delphia

Meniere's Syndrome and Migraine Observations on a Common  
Causal Relationship ERIC MILLS ATKINSON New York

Discussion to be opened by BAYARD T HORTON Roches-  
ter, Minn, and MARY ELIZABETH O'SULLIVAN New  
York

Friday, June 12—9 a m

JOINT MEETING WITH SECTION ON ORTHOPEDIC SURGERY

PANEL DISCUSSION ON POLIOMYELITIS

STANLEY COBB Boston, Moderator

Experimental Work on Muscular Atrophy (Lantern Demon-  
stration)

D Y SOLANDT, Toronto Canada

Pathology and Pathogenesis of Human Poliomyelitis (Lantern  
Demonstration)

ALBERT B SABIN, Cincinnati

Effects of Immobilization and Activity on Neuromuscular  
Regeneration (Lantern Demonstration)

H M HINES, Iowa City

The Role of Physical Therapy in the Early Treatment of Polio-  
myelitis (Lantern Demonstration)

H R MCCARROLL, St Louis

Pain and Tenderness During Acute Stage of Poliomyelitis,  
with Comments on Kenny Treatment

FRANK R OBER Boston

## SECTION ON DERMATOLOGY AND SYPHILOLOGY

MEETS IN SECTION ROOM 12 THIRD FLOOR CONVENTION HALL

### OFFICERS OF SECTION

Chairman—C F LEHMANN San Antonio, Texas

Vice Chairman—Paul E BECHET New York

Secretary—NELSON PAUL ANDERSON Los Angeles

Executive Committee—JOHN G DOWNING, Boston, J GARD-  
NER HOPKINS New York, C F LEHMANN, San Antonio,  
Texas

Wednesday, June 10—9 a m

Chairman's Address C F LEHMANN, San Antonio, Texas

Leprosy The Correlation of Its Clinical Immunologic, Patho-  
logic and Bacteriologic Aspects (Lantern Demonstra-  
tion)

V PARDO CASTELLO and FRANCISCO R TRIANT, Havana,  
Cuba

Discussion to be opened by HOWARD FOX New York

The Place of Dermatology in the Armed Forces of the United States  
WILLIAM H. GUY, Pittsburgh  
Discussion to be opened by MARION B. SUZZURGER, New York

Cutaneous Changes in the Spine Syndrome (Lantern Demonstration)  
WILLIAM H. KAUFMAN and DUBOIS C. SMITH, Charlottesville, Va.  
Discussion to be opened by J. LAMAR CATTAWAY, Durham, N. C.

Sarcoid Disease (Lantern Demonstration)  
CARMIN C. THOMAS, Philadelphia  
Discussion to be opened by CHATLAND J. WHITE, Chicago

Scrofula (Lantern Demonstration)  
ADOLPH H. CONRAD and ADOLPH H. CONRAD JR. and RICHARD S. WEISS, St. Louis  
Discussion to be opened by FRED D. WHIMMAN, Philadelphia and FRANCIS A. ELLIS, Baltimore

Primary Relapsing Eczematous Nodular Panniculitis (Lantern Demonstration)  
J. LOWRY MILLER, New York  
Discussion to be opened by STUART C. WAX, San Francisco and LORRY J. CUMMINS, Boston

Thursday, June 11—9 a. m.

The Complement Fixation Test for Lymphogranuloma Venereum (Lantern Demonstration)  
ARTHUR W. GRACE, Brooklyn, and GREGORY W. RAKI, New Brunswick, N. J.  
Discussion to be opened by DAVID BLOOM and HELEN O. CLETH, New York

Reporting Serologic Tests for Syphilis (Lantern Demonstration)  
WILLIAM A. CLARK, Houston, Texas  
Discussion to be opened by JOHN H. STOKES, Philadelphia and BENJAMIN S. KLINE, Cleveland

Biologic False Positives in Serologic Tests of Syphilis (Lantern Demonstration)  
RICHARD L. KAHN, Ann Arbor, Mich.  
Discussion to be opened by CHARLES R. REIN, New York

Bismuth in the Treatment of Syphilis: A Review of Fourteen Years' Experience  
HERMAN BIERMAN and BERTRAM SHAFER, Philadelphia, and CLARENCE S. LIVINGOON, Indianopolis, Pa.  
Discussion to be opened by ARTHUR G. SCHUCH, Dallas, Texas

The Use of Bismuth Compounds in Syphilotherapy: II Results of Treatment of Latent Syphilis by Bismuth Compounds Combined in Part with Arsenicals (Lantern Demonstration)  
DAVID KAHN and S. WILLIAM BECKER, Chicago  
Discussion to be opened by C. J. LUNSFORD, Oakland, Calif., and HARRY C. SAUNDERS, New York

Bismuth Hepatitis: A Survey of 121 Cases (Lantern Demonstration)  
GEORGE V. KUCHAR, San Francisco, and WILLIAM J. RYLANDS, San Anselmo, Calif.  
Discussion to be opened by JOHN E. DALTON, Indianapolis, and BERNARD APPL, Lynn, Mass.

Mapharsen in the Treatment of Congenital Syphilis (Lantern Demonstration)  
GERSCH D. ASTRACHAN and VAN ALSTYNE H. CORNELL, New York  
Discussion to be opened by NORMAN R. INGRAHAM, Philadelphia, and JOHN E. RAUSCHKOLB, Cleveland

Friday, June 12—9 a. m.

#### Election of Officers

The Treatment of Cutaneous Melanomas (Lantern Demonstration)  
JAMES R. DRIVER, Cleveland  
Discussion to be opened by H. FORD ANDERSON, Washington, D. C., and EUGENE F. TRAUB, New York

Shock Proof X-Ray Apparatus in Dermatology (Lantern Demonstration)  
ANTHONY C. CIPOLIARO and ARTHUR MUTSCHELLER, New York  
Discussion to be opened by C. GUY LANE, Boston, and GEORGE C. ANDREWS, New York

Microaerophilic Streptococcus Infection Causing Destruction of the Nose  
MAURICE J. COSTELLO, New York  
Discussion to be opened by FRANK L. MELLNEY, New York

Phenomenon of Black Dermographism (Lantern Demonstration)  
ERICH URBACH and DONALD M. PILLSBURY, Philadelphia  
Discussion to be opened by SAMUEL M. PECK, New York

Hydroa Estivale: A Successful Treatment  
FRANCIS M. THURMON, Boston  
Discussion to be opened by JOHN H. LAMB, Oklahoma City

Thrombocyte Deficit (Lantern Demonstration)  
MERLIN T.-R. MAYNARD, San Jose, Calif.  
Discussion to be opened by THEODORE CORNBLEET, Chicago

### SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

MEETS IN SECTION ROOM B, FIRST FLOOR, CONVENTION HALL

#### OFFICERS OF SECTION

Chairman—HAVEN EMERSON, New York  
Vice Chairman—JOSEPH W. MOUNTIN, Washington, D. C.  
Secretary—W. A. SAWYER, Rochester, N. Y.  
Executive Committee—HAROLD S. DIEHL, Minneapolis, Minn.; LANCE D. SELBY, Detroit; HAVEN EMERSON, New York

Wednesday, June 10—2 p. m.

Gastrointestinal Disease Among Industrial Workers (Lantern Demonstration)  
LEMUEL C. MCGEE, Wilmington, Del.  
The Berkeley Plan for Industrial Health Service  
ROBERT T. LEGGE, Berkeley, Calif.

Postgraduate Education in Industrial Health  
WALTER L. BIERRING, Des Moines, Iowa  
Results of Use of Multiple Vitamins for Prevention of Colds  
HAROLD S. DIEHL, Minneapolis

Rehabilitation in Selective Service System  
L. G. ROWNTREE, Washington, D. C.

Thursday, June 11—2 p. m.

Chairman's Address  
HAVEN EMERSON, New York  
Yellow Fever  
WILBUR A. SAWYER, New York  
Health Problems in Connection with War Housing Projects  
DONALD K. FREEDMAN, Washington, D. C.  
Civilian Measures for the Control of the Venereal Diseases in World War II  
A. J. ASELMAYER, Washington, D. C.  
The Problem of Transfusion Syphilis (Lantern Demonstration)  
WILLIAM W. FRIE, Nashville, Tenn.

Friday, June 12—2 p. m.

Election of Officers  
Dietary Conditions Among Industrial Workers  
R. S. GOODHART, Forest Hills, N. Y.  
Dietary Conditions in the Army  
PAUL E. HOWE, Washington, D. C.  
Dietary Conditions in the Navy

### SECTION ON UROLOGY

MEETS IN SECTION ROOM 12 THIRD FLOOR CONVENTION HALL  
OFFICERS OF SECTION

Chairman—VINCENT J. O'CONOR, Chicago  
Vice Chairman—GERSHOM J. THOMPSON, Rochester, Minn.  
Secretary—GRAYSON L. CARROLL, St. Louis  
Executive Committee—Frederic E. B. FOLEY, St. Paul; MEREDITH F. CAMPBELL, New York; VINCENT J. O'CONOR, Chicago

Wednesday, June 10—2 p. m.

The Urethrogram as an Aid in Diagnosis of Prostatic Abscess (Lantern Demonstration)  
W. E. FORSYTHE JR., New York

Pathologic Conditions Encountered in Horseshoe Kidney (Lantern Demonstration)  
A. E. GOLDSTEIN, Baltimore

Resection of Kidney (Lantern and Motion Picture Demonstration)  
W. CALHOUN STIRLING, Washington, D. C.

Discussion on papers of DR. FORSYTHE, DR. GOLDSTEIN and DR. STIRLING to be opened by GEORGE C. PRATIER, Boston, and JOSEPH F. MCCARTHY, New York

Life After Nephrectomy (Lantern Demonstration)  
HERMAN L. KRETSCHMER, Chicago

Does Vitamin A Deficiency Exist in Clinical Urolithiasis? Studies Based on Clinical and Pathologic Material (Lantern Demonstration)  
HUGH J. JEWETT, Baltimore

Pancreatic Tissue Extract in Ureterspasm

HENRY W. E. WALTHER New Orleans  
Discussion on papers of DR. KRETSCHMER, DR. HWEFTT  
and DR. WALTHER to be opened by ALBERT F. OCKEN-  
BLAD, Kansas City, Mo.

Thursday, June 11—2 p m

Chairman's Address (Lantern Demonstration)  
VINCENT J. O'CONNOR Chicago  
Address JORGE CAVALIER, Bogota, Colombia, South America  
Aneurysm of the Renal Artery (Lantern Demonstration)  
OSWALD S. LOWSLEY and EDWARD M. CANNON New  
York

Five Year Results of Carcinoma of the Bladder Treated by  
Radium (Lantern Demonstration)  
B. S. BARRINGER New York

The Retrograde Solution of Phosphatic Urinary Calculi (Lan-  
tern Demonstration) HOWARD I. SURY, Boston

Scientific Dietotherapy of Renal Vascular Disease (Lantern and  
Motion Picture Demonstration)

F. M. ALLEN and O. M. COFF New York  
Discussion to be opened by CARL E. BURFORD St. Louis  
GEORGE G. SMITH, Boston, and WILLIAM F. BRAUNSCHE  
Rochester, Minn.

Friday, June 12—2 p m

Election of Officers

SYMPOSIUM ON TREATMENT OF CARCINOMA  
OF THE PROSTATE GLAND

Carcinoma of the Prostate Gland Clinical Data Concerning  
253 Cases Treated by Transurethral Resection (Lantern  
Demonstration)

GERSHON J. THOMPSON Rochester, Minn.  
A Preliminary Report of Biochemical Therapeutics in Carcinoma  
of the Prostate Gland (Lantern Demonstration)

WILLIAM P. HERBST Washington, D. C.  
Clinical Observation of Treatment of Advanced Carcinoma of  
the Prostate Gland with Metastasis (Lantern Demonstra-  
tion) EDWIN P. ALYEA, Durham, N. C.

The Recognition and Treatment of the Incipient Carcinoma of  
the Prostate Gland (Lantern Demonstration)

CHARLES D. CREEV, Minneapolis  
Orchiectomy in Treatment of Prostatic Carcinoma A Report  
of 75 Cases Followed Six Months or More After Opera-  
tion (Lantern Demonstration)

REED M. NESBIT and ROBERT H. CUMMINGS, Ann Arbor,  
Mich.  
Discussion to be opened by H. C. BLUMPS JR., Pasadena  
Calif., ARBOR D. MUNGER Lincoln, Neb., and PARKE  
G. SMITH, Cincinnati

SECTION ON ORTHOPEDIC SURGERY

MEETS IN SECTION ROOM D, FIRST FLOOR,  
CONVENTION HALL

OFFICERS OF SECTION

Chairman—JAMES A. DICKSON, Cleveland  
Vice Chairman—GUY A. CALDWELL New Orleans  
Secretary—FRANCIS M. McKEEVER Los Angeles  
Executive Committee—ROBERT V. FURSTEN, Charlottesville,

## THE SCIENTIFIC EXHIBIT

The Scientific Exhibit will occupy the lower level of the Atlantic City Auditorium with entrances down the stairs from the registration desks and the Technical Exhibit.

Chief among the features of interest will be the Pan American participation with exhibits from various countries dealing with tropical medicine. Special exhibits will be presented again on fractures and backache under provisions made by the Board of Trustees. The Army, the Navy, the Public Health Service, the Selective Service System and the Office of Civilian Defense will be represented with exhibits pertaining to the activities of each of those branches of the federal government. An exhibit symposium on cardiovascular disease has been arranged under the guidance of the Section on Practice of Medicine. Lectures with demonstrations will be given throughout the week on poliomyelitis and diabetes. Each section of the Scientific Assembly has sponsored groups of exhibits dealing with the various specialties, but emphasis is placed on the fact that the Scientific Exhibit is primarily for the physician in general practice.

Motion pictures will be shown each day continuously and simultaneously in four theaters adjacent to the exhibits.

Admission to the Scientific Exhibit will be limited to persons wearing Fellowship or other badges of the convention and to guests to whom special cards of admission have been issued. The public will not be admitted to the Scientific Exhibit.

## SPECIAL EXHIBITS

At the request of the Committee on Scientific Exhibit of the Board of Trustees there will be two special exhibits this year. (These exhibits are not open to awards.)

## Special Exhibit on Fractures

The special exhibit on fractures is presented under the auspices of the fracture exhibit committee composed of

Kellogg Speed, Chicago, chairman  
Frank D. Dickson, Kansas City, Mo.  
Walter Estell Lee, Philadelphia

The following subjects will be considered with continuous demonstrations throughout the week:

1. How to Make and Store Plaster of Paris Bandages
2. Fracture of the Neck of the Femur (nonoperative treatment)
3. Compression Fracture of the Os Calcis
4. Compression Fracture of the Spine
5. Supracondylar Fracture of the Humerus
6. Emergency Treatment of Fractures of the Extremities

A pamphlet giving the essential points of the exhibit has been prepared for distribution.

The local representative for the fracture committee is James H. Mason III, Atlantic City, N. J.

A large corps of demonstrators will assist the committee in the presentation of the exhibit, including

|                                   |  |
|-----------------------------------|--|
| John D. Adams, Boston             | Thomas C. McAuliffe, Philadelphia      |

| J. Archer O'Reilly, St. Louis     |                             |

with the collaboration of

|                                   |                               |
|-----------------------------------|-------------------------------|
| Iben J. Carey, Milwaukee          | K. G. Hansson, New York       |
| Albert Ferguson, Brookline, Mass. | Theodore A. Willis, Cleveland |
| H. Close Hesselstine, Chicago     | Walter Zeit, Milwaukee        |

and an advisory committee consisting of

|                              |                                  |
|------------------------------|----------------------------------|
| Iremont A. Chandler, Chicago | Robert D. Schrock, Omaha         |
| H. Larle Conwell, Birmingham | E. Harlan Wilson, Columbus, Ohio |
| John S. Coulter, Chicago     | Walter J. Zeiter, Cleveland      |
| Philip Lewin, Chicago        |                                  |

The exhibit deals with the following factors:

1. Anatomy: Eben J. Carey and Walter Zeit. Specimens and demonstrations illustrating anatomy of the spine.
2. Pathology: Theodore A. Willis. Specimens and demonstrations illustrating common pathologic disturbances which are concerned in backache.
3. Physical Examinations: Frank R. Ober. Diagrams and demonstrations illustrating methods of physical diagnosis.
4. Roentgen Ray Technique: Albert Ferguson. Diagrams and roentgenograms in atlas form.
5. Neurologic Examinations: Carl E. Badgley. Illustrations and demonstrations covering the neurologic aspects of backache.
6. Visceral Disturbances: H. Close Hesselstine. Illustrations and demonstrations dealing with visceral disturbances as found in internal medicine, obstetrics, gynecology and urology.
7. Physical Therapy: K. G. Hansson. Illustrations and demonstrations presenting physical therapy aids in the treatment of backache.
8. General Treatment: Frank R. Ober. Apparatus and operative treatment for backache, with demonstrations at 10:30 and 3:30 each day, followed by general discussions concerning the use of corsets, braces and the like.

A pamphlet has been prepared for distribution which gives the essential points of the exhibit.

In addition to the physicians in charge of each booth, a competent corps of demonstrators will be present continuously throughout the week.

## LECTURES AND DEMONSTRATIONS

Lectures with demonstrations will be presented continuously throughout the week in two theaters adjoining the exhibits

## Polomyelitis

Lectures and demonstrations will be presented under the auspices of the National Foundation for Infantile Paralysis and the University of Minnesota School of Medicine. The method of examining patients with acute polomyelitis for muscle tenderness, muscle spasm, and other major symptoms will be presented. The method of treatment of these symptoms as advocated by the Australian nurse Miss Elizabeth Kenny will be demonstrated on living models. Each demonstration will be accompanied by a discussion of the symptoms and their treatment together with a discussion of the pathologic and physiologic backgrounds for such. Charts, diagrams and photographs will be used to supplement the demonstration and discussion.

Lectures will be given daily from Monday noon to Friday noon at the following hours

|           |          |
|-----------|----------|
| 9 30 a m  | 2 30 p m |
| 11 15 a m | 4 15 p m |

Don W. Gudakunst, New York, will be in charge assisted by the following

|                             |                             |
|-----------------------------|-----------------------------|
| Philip M. Stimson New York  | John F. Pohl Minneapolis    |
| Wallace H. Cole Minneapolis | Miland E. Knapp Minneapolis |

## Diabetes

Lectures and demonstrations on the physiology, pathology, chemistry, diagnosis and treatment of diabetes will be given daily from Monday afternoon to Friday noon at the following hours

|         |       |
|---------|-------|
| 10 a m  | 2 p m |
| 11 a m  | 3 p m |
| 12 noon | 4 p m |

After each lecture, time will be allowed for discussion, questions and personal interviews. The following will contribute to the program

|                              |                                |
|------------------------------|--------------------------------|
| C. C. Bailey Boston          | Howard F. Root Boston          |
| Thorne M. Carpenter Boston   | William C. Stadie Philadelphia |
| F. C. Dohan Philadelphia     | Shields Warren Boston          |
| Elliott P. Joslin Boston     | Priscilla White Boston         |
| F. D. W. Lukens Philadelphia |                                |

## Selective Service and Civilian Defense

Opportunities for conference and consultation will be given physicians concerning these two important phases of the war effort

LEONARD G. ROWNTREE and ROBERT A. BIER, National Headquarters Selective Service System, Washington, D. C.

*The Medical Division National Headquarters Selective Service System* Exhibit of charts, pictures and drawings depicting the medical work of Selective Service in all its aspects, with the analysis of the results of the physical examination of registrants

GEORGE BAEHR, W. PALMER DEARING, HENRY VAN ZILE, HYDE JOHN S. COULTER and DUDLEY A. REEKIE, Office of Civilian Defense, Medical Division Washington, D. C.

*Emergency Medical Service for Civilian Defense* Exhibit of charts showing organization of civilian defense for a community and progress of organization of Emergency Medical Service, a transparent poster entitled "When the Bombs Drop," illustrating the operation of the Emergency Medical Service, equipment for medical field units, chart of chemical warfare agents, model of gas decontamination station, model with gas mask and gas-proof clothing

## Section on Practice of Medicine

The representative to the Scientific Exhibit from the Section on Practice of Medicine is Louis B. LaPlace, Philadelphia. The Section is cooperating with the American Heart Association in presenting an exhibit symposium on cardiovascular disease

LEFRET S. LIWOOD, National Board of Medical Examiners, Philadelphia

*National Board of Medical Examiners* Exhibit of charts describing the work and progress of the National Board of Medical Examiners and the results of its examinations

ELLIOTT P. JOSLIN, HOWARD F. ROOT and PRISCILLA WHITE, George F. Baker Clinic, New England Deaconess Hospital Boston

*Fundamental Concepts in Diabetes as a Basis for Treatment* Exhibit presenting an interpretation of the recent studies of fat metabolism and diabetes experimentally produced presentation of new data obtained from study and treatment of pregnancy in diabetes of childhood diabetes of long duration analyses of statistics on coma, gangrene and the incidence of diabetes, observation on the use of newer types of insulin vitamin deficiency in diabetic animals

NATHAN SCHAEFFER and IRVING L. APPELBAUM, American College of Chest Physicians, Orange, N. J.

*Role of Fungi in Disease of the Chest* Exhibit of cultures of fungi, photomicrographs of the fungi and tissue sections, charts of clinical cases and roentgenograms of lung conditions, models of lungs

E. J. KEPLER, M. H. POWER and F. J. ROBINSON, Mayo Clinic, Rochester, Minn.

*Diagnosis and Treatment of Addison's Disease* Exhibit illustrating methods adapted to the diagnosis of Addison's disease with special attention paid to the "water test" by the exhibitor

PALL TITUS, Advisory Board for Medical Specialties, Pittsburgh

*Advisory Board for Medical Specialties* Exhibit of posters showing the nineteen member organizations, members of specialty boards requirements, statistical data certificates and literature

H. G. WEISNOTTEN, F. H. ARESTAD, J. R. HARRIS, HOMER F. SANGER and M. G. WESTMORELAND, Council on Medical Education and Hospitals, American Medical Association, Chicago

*Progress of Medical Education* Exhibit showing output of medical and technical graduates related to war needs including medical school graduates, interns, residents, clinical laboratory technicians, physical therapists and occupational therapists revised data on medical education and medical licensure, annual census of hospitals for the year 1941, revised lists of approved medical colleges, hospitals approved for internships and residencies and approved technical schools

GEORGE L. WALDBOTT, Detroit

*Wheezing That Is Not Asthma* Exhibit of roentgenograms which had been wrongly diagnosed as "asthma," including (1) simulating asthma, such as Monilia infection, substernal goiter, tuberculosis, Pancoast tumor, (2) resulting from asthma pneumonia, saccular bronchiectasis, spontaneous pneumothorax, chronic atelectasis of a pulmonary lobe, pulmonary blebs as a result of emphysema, spontaneous rib fractures, (3) initiating asthma allergic pulmonary edema, pneumonia, and Loeffler's syndrome (4) coincident with asthma tuberculosis, dextrocardia, mycosis of lungs and like conditions

HENRY R. CARSTENS and J. D. LALAN, Michigan Medical Service, Detroit

*Michigan Medical Service* Exhibit of display material, charts and posters presenting the experiences as to frequency of services costs and payments to physicians and featuring the actual results of the operation of the prepayment medical service under the sponsorship of a medical society

FIMIR H. LOUGHIN, RICHARD H. BINNETT, SAMUEL H. SPITZ, WILLIAM W. CARTY with the assistance of MARY E. FRANKLIN, Long Island College Hospital, Brooklyn

**Pneumonia** Exhibit of charts, drawings, photographs, photomicrographs and roentgenograms presenting (1) diagnosis, (2) pathology, (3) treatment, discussing the pharmacology and use of the sulfonamide drugs, including the results of original studies in absorption, excretion and acetylation of these compounds, as well as results obtained with chemotherapy in our own as well as other series of cases, brief summary for indications for administration of serum (4) complications of pneumonia with recommended methods of treatment

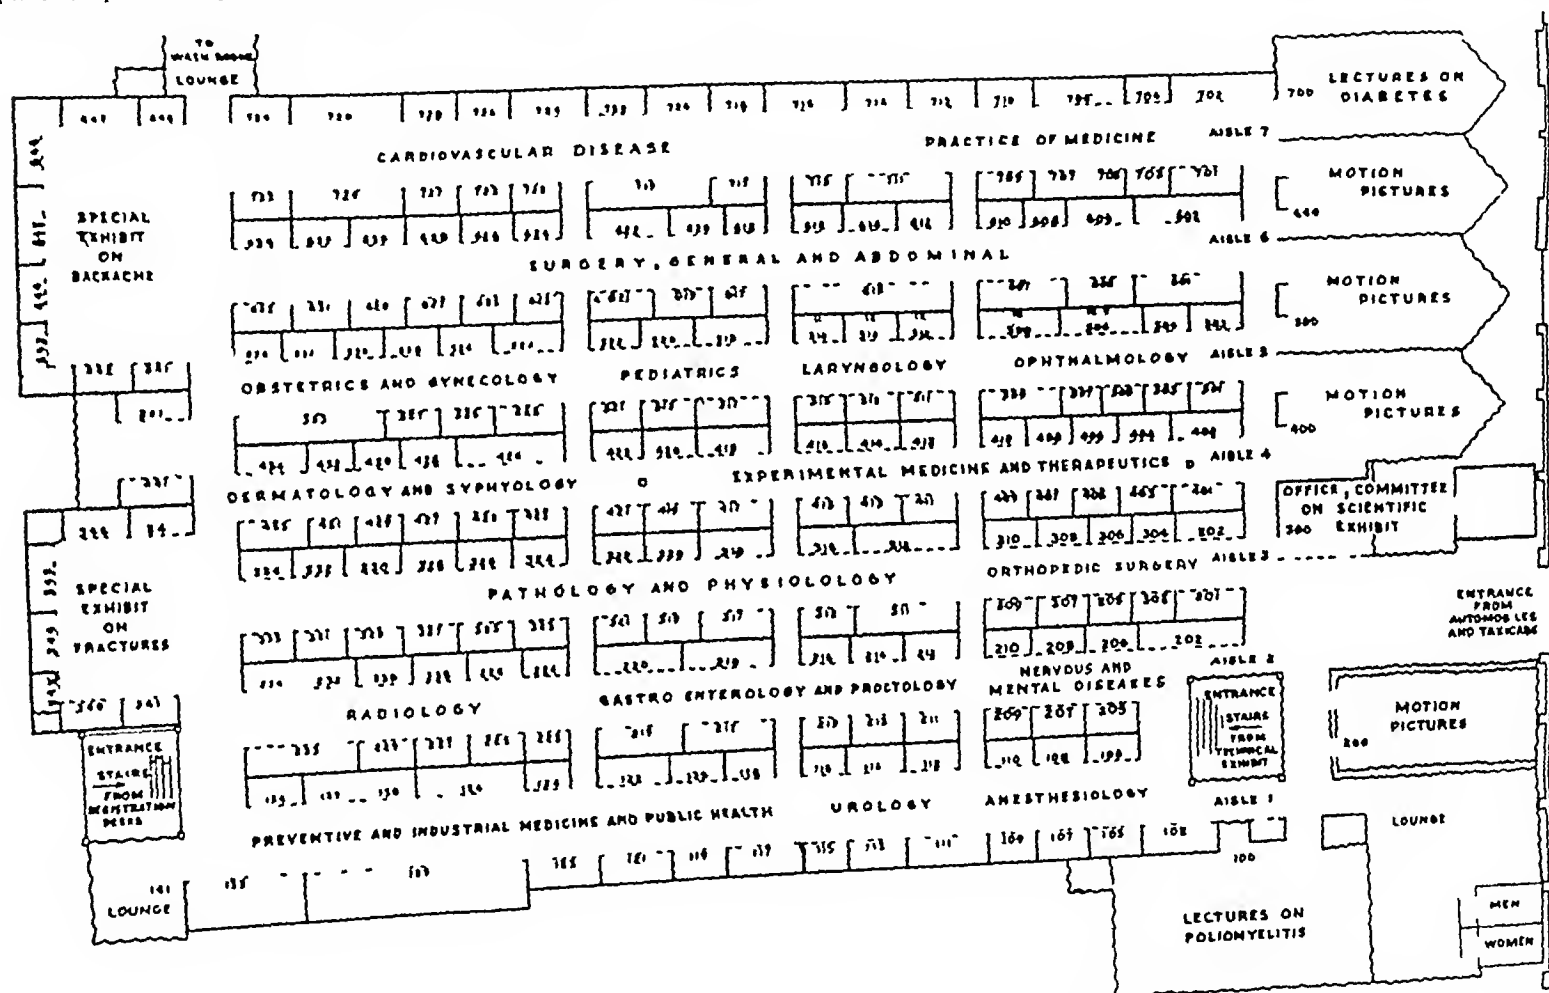

WILLIAM DAMUSHEK, THOR J. GREENWALT, RUSSELL J. LAT and CAMILLA DREYER, J. H. Pratt Diagnostic Hospital and Boston Dispensary, Boston

**The Hemolytic Syndromes Hemoglobinurias Hereditary and Acquired Hemolytic Anemias** Exhibit of charts, drawings, photographs and photomicrographs showing that the hemolytic

of the nephron, (2) the standard procedures now in use, including the range of normal and abnormal values, (3) a pictorial description of the technic employing solution of posterior pituitary, (4) diagrammatic representation of the physiologic effects of solution of posterior pituitary on diuresis, normal standards included, (5) diagrammatic comparison of the present procedure with other techniques, (6) results of the test in patients with renal diseases, (7) contraindications to the test, (8) results and advantages of the procedure

T. H. MCGAVACK and F. D. SPEER, New York Medical College, Lower and Fifth Avenue Hospitals, New York

**Size of the Heart as a Guide to the Treatment of Addison's Disease with Desoxycorticosterone Acetate** Exhibit of graphs, charts and roentgenograms showing that the size of the heart is an accurate and reliable index to the condition of the patient with Addison's disease who is receiving desoxycorticosterone acetate, roentgenograms of the chest of patients with Addison's disease showing various states of cortical activity, cardiac

Floor plan of Scientific Exhibit, on lower level of Convention Hall

syndromes may be classified as (1) the hemoglobinurias (paroxysmal cold, march, nocturnal, favism) indicating sudden and violent hemolysis, (2) the hereditary hemolytic anemias, which may be classified according to type of cell seen as (a) spherocytic (b) target cell and (c) sickle cell in type, (3) the acquired hemolytic anemias, due to "hypersplenism," those associated with hemolysins of agglutinins and those which are "symptomatic" of some more serious underlying condition. In the diagnosis and follow-up of cases of hemolytic jaundice, studies of the bone marrow, the blood serum and particularly of the fecal urobilinogen output are important. Cases of familial non-hemolytic jaundice must be discriminated. The management of the hemolytic crisis and of acute hemolytic anemia involves careful judgment regarding such considerations as isohemolysins, isoagglutinins, autoagglutinins, compatibility tests, transfusions and, above all, splenectomy

W. A. SODRMAN and H. T. ENGELHARDT, Tulane University of Louisiana School of Medicine, New Orleans

**A Renal Concentration Test Employing Posterior Pituitary Extract** Exhibit of charts demonstrating (1) the physiology

measurements will be brought into relationship with daily intake of sodium and daily dose of desoxycorticosterone acetate used. Measurements of the heart in crisis, cardiac insufficiency and full stabilization will be compared with those seen in normal persons

F. LOWELL DUNN, University of Nebraska College of Medicine, Omaha, and WALTER E. RAHM, JR., New York

**Cathode Ray Visualization of Normal and Pathologic Chest and Pathologic Chest Sounds** The exhibit will consist of equipment used and charts and photographs of vocal fremitus recordings in normal and various pulmonary diseases. In addition there will be a preliminary analysis of normal and abnormal heart tones. The visualization and photography of chest sounds utilizing a piezo-electric microphone, a linear amplifier and a cathode ray tube offers definite refinements in analysis as compared with auditory methods

GUILLAUME A. BOSCO, University of Buenos Aires Medical School, Buenos Aires, Argentina

**Anatomic Revision of the System of Coronary Arteries, Vena Nomenclature of Myocardial Infarct and Clinical and Sympto**

*anatomic Basis for an Anatomocardiographic Diagnosis of Coronary Arterial Obstruction* Exhibit of radiograms and electrocardiograms demonstrating the distribution of the coronary arterial system. The division of the cardiac muscle in well delimited anatomic territories, which are tributary of the coronary arterial system, and Boscos new nomenclature of myocardial infarct are based on the foregoing conceptions. The demonstration constitutes a categorical evidence of the fact that myocardial infarct originates from the left ventricle in 80 per cent of the cases and from the posterior wall of the right ventricle in 20 per cent of the cases, depending on the type, either normal or abnormal, of the distribution of the left circumflex coronary system.

J. Q. GRIFFITH JR. and M. A. LINDAUER, Medical Clinic of the Hospital and Robinnette Foundation, University of Pennsylvania, Philadelphia

*Hypertension—Especially Its Classification and Medical Treatment* Exhibit demonstrating the tests and procedures which have been reported, apparatus for observing the capillaries of the forearm in man and measuring the minute vessel pressure, photographs and plastic materials demonstrating the method for measuring cutaneous lymphatic flow in man, for testing for antidiuretic substance in the blood, and a microtest for thiocyanate in the blood, the kind of case apt to respond well to thiocyanate therapy or irradiation of the pituitary.

EDGAR DURBIN, Denver

*A Pictorial Study of Heart Disease* Exhibit of enlarged Kodachrome pictures of various pathologic hearts and accompanying clinical signs, case histories, roentgenograms and electrocardiograms correlated with the clinical and the pathologic aspects of heart disease.

GERALD H. PRATT and JOSEPH KOVACS, Vascular Clinic, New York Post-Graduate Hospital and Medical School, Columbia University, New York

*Diagnosis and Treatment of Leg Ulcers* Exhibit of pictures and charts differentiating ulcers following arteriosclerosis, diabetes, varicose veins, syphilis and idiopathic causes, medical and surgical treatment of various types of ulcers are described.

EDWARD ALLEN EDWARDS, Boston City Hospital, and JESSE E. EDWARDS, Mallory Institute of Pathology, Boston

*Pathology of the Venous Valves* Exhibit of drawings and photomicrographs dealing with the pathology of the venous valves. The valves in thrombophlebitis show destruction, or stenosis and incompetence in varicose veins, relative incompetence and distortion by reparative tissue, and in thromboangitis obliterans, involvement in inflammation, and in thrombosis, as well as postobstructive changes similar to the lesions in varicose veins.

S. S. LICHTMAN, Mount Sinai Hospital, New York

*Present Status of the Treatment of Subacute Bacterial Endocarditis* Exhibit of charts summarizing results of treatment by current methods, illustrative case.

JACOB POMERANTZ, Temple University, Philadelphia

*Cardiac Pain and Its Pathways* Exhibit of a model of the heart and its associated plexuses, sympathetic pathways and connections with the peripheral nervous system, a demonstration of possible pathways transmitting pain of cardiac origin.

EDWARD F. McLAUGHLIN, Germantown Dispensary and Hospital, Philadelphia

*Practical Points in Peripheral Vascular Disease* Exhibit of charts and transparencies dealing with the practical points of varicose veins, Buerger's disease, arteriosclerosis, emboli and like conditions.

SAMUEL BELLET and HERMAN W. OSTRUM, Philadelphia General Hospital and University of Pennsylvania, Philadelphia

*Röntgenology of Heart and Great Vessels* Exhibit of cardiac silhouettes, including both common and rare heart lesions,

accompanied by explanatory notes of the history, clinical examination and salient roentgenographic features, pathologic specimens are included.

DON CARLOS PIRTI, University of Kansas Medical School, Kansas City, Kan.

*Acute Rheumatic Fever and Its Complications* Exhibit describing the etiologic factors, clinical diagnosis and differential diagnosis of acute rheumatic fever. The complications of acute rheumatic fever are presented as well as a description of the physical manifestations of rheumatic heart disease, including roentgenograms and electrocardiograms of the types of mitral and aortic stenosis along with photomicrographs showing the pathologic changes in rheumatic myocarditis and pericarditis. The physical aspects of subacute bacterial endocarditis are demonstrated with photographs that include petechial hemorrhage of the conjunctiva. There is also shown a rabbit's heart in which experimental bacterial endocarditis has been produced. There will also be displayed charts showing the results of a dietary survey made on patients with acute rheumatic heart disease. This survey demonstrates that these patients have a pronounced dietary deficiency.

J. I. F. RISEMAN and FREDOT L. SAGAN, Beth Israel Hospital, Boston

*Treatment of Ingua Pectus* Exhibit of charts and posters showing objective measurements of sixty-five different methods of therapy studied during the past nine years.

ARTHUR S. W. TOLROFF, Beth Israel Hospital and Mount Sinai Hospital, New York

*Surgical Treatment of Subacute Streptococcus Viridans Endarteritis Superimposed on Patent Ductus Arteriosus* Exhibit presenting (1) the anatomy of patent ductus arteriosus, (2) the pathology of superimposed subacute Streptococcus viridans endarteritis, (3) a discussion of the rationale of operation for the cure of infection, (4) indications and contraindications to such an operation, and (5) a report of the cases in which an operation was done by the author during the past two and a half years, illustrated by clinical charts and other data.

ISAAC STARR and A. J. RAWSON, University of Pennsylvania, Philadelphia

*The Ballistocardiograph, with Records Obtained in the Common Diseases of the Heart and Circulation* Exhibit showing a ballistocardiograph arranged so that one can stand on it and see the impacts arising from the movements of the circulation projected on a screen, records obtained in patients with coronary disease, auricular fibrillation, hypertension and other diseases of the heart and circulation, records showing the effects of exercise, drug action, fever, transfusion and other acute experiments.

MARCY L. SUSSMAN, M. A. STEINBERG and ARTHUR GRISHMAN, Mount Sinai Hospital, New York

*Angiocardiography in Congenital and Rheumatic Heart Disease* Exhibit of roentgenograms presenting a systematic investigation of various types of congenital and rheumatic heart disease has been made by angiocardiography with the aid of a multiple exposure technic. The complete clinical and laboratory data will be shown in each case in correlation with the angiocardiograms.

EMANUEL LIBMAN, New York

*Endocarditis and 'Libman-Sack Disease'* Exhibit of drawings and photomicrographs showing pathology of various kinds of endocarditis and especially of the form associated with Libman-Sack disease, summary of our knowledge of this disease.

LOUIS B. LAPLACE and CHARLES W. SEMISCH, Jefferson Medical College, Philadelphia

*Graphic Registration of Heart Sounds* Exhibit of graphic records of heart sounds with photographic enlargements obtained from normal subjects and patients having the commoner types of heart disease. The sound records are correlated with the

electrocardiogram and records of precordial movements and vascular pulses to facilitate interpretation. The contribution of stethocardiography to the accuracy of auscultation is illustrated and an evaluation is made of the usefulness of stethocardiography in clinical practice.

ANNA S. WRIGHT, American Heart Association, New York

*American Heart Association* Exhibit of charts and photographs showing educational material relating to heart disease

### Section on Surgery, General and Abdominal

The representative to the Scientific Exhibit from the Section on Surgery, General and Abdominal, is GROVER C. PENBERTH, Detroit

ARNOLD S. JACKSON, JAMES A. JACKSON and RUSSELL JACKSON, The Jackson Clinic, Madison, Wis.

*Cancer of the Breast* Exhibit of moulages and transilluminated colored drawings showing the anatomy of the normal breast. Moulages, roentgenograms and colored photographs depicting the diagnosis for carcinoma of the breast. Colored drawings and photographs illustrating the surgical treatment. Moulages and photomicrographs demonstrating the pathology of different types of cancer. Charts showing the end results from statistical studies.

HAROLD I. FOSS and HENRY F. HUNT, Geisinger Memorial Hospital, Danville, Pa.

*Diagnosis and Treatment of Toxic Goiter* Exhibit of (1) transparencies and slides showing methods of examination in hyperthyroidism with photographs touching on differential diagnosis between toxic goiter and nervous states often confused with true hyperthyroidism, (2) the heart in toxic goiter, (3) photographs illustrating the technic of bilateral resection and multistage operations in the treatment of hyperthyroidism, (4) transparencies illustrating the pathologic states associated with acute crisis and in death from advanced hyperthyroidism.

HAROLD NATHAN and GABRIEL P. SITTA, Mount Sinai Hospital, New York

*Lesion of Main Venous Trunks for Suppurative Phlebitis* Exhibit of charts, diagrams and microscopic pathology illustrating the pathogenesis, course, treatment and prognosis of suppurative phlebitis.

ARTHUR F. HIRTZLER, Halstead Hospital, Halstead, Kan.

*Goiter* Exhibit of models, specimens, drawings, photographs, photomicrographs and transparencies showing the clinical character of goiter in its different forms, as evidenced by gross and microscopic pathology, chemical changes, patient's appearance and like conditions and emphasizing the life history and evolution of the diseased thyroid gland from the earliest stage to terminal cardiotoxic goiter. Treatment confined to basic features of operative technic.

FREDERICK TICE, RICHARD DAVISON and KARL J. HENRICHSEN, Municipal Tuberculosis Sanitarium, Chicago

*Tuberculosis and Other Diseases of the Lungs* Exhibit of roentgenograms and pathologic specimens illustrating diseases of the lungs—tuberculosis and associated diseases, tumors and others—with results of surgical treatment.

MINTON S. LLOYD and JOSEPH A. BURTTI, New York Municipal Sanatorium, Otisville, N. Y.

*Bronchoscopy in the Therapy of Pulmonary Tuberculosis* Exhibit of drawings of endobronchial lesions with contemporaneous roentgenograms of the chest, showing the value of bronchoscopy for the guidance of the collapse therapist.

WOLFF K. BARROW, Lexington, Ky.

*Tuberculous Peritonitis* Exhibit presenting the incidence, symptoms and physical findings of approximately 100 patients with tuberculous peritonitis, careful and complete follow-up studies and results of treatment are analyzed in detail and presented with the aid of photographs and charts.

HORACIO ZALCE, Mexico City, Mexico, with the assistance of Bradley L. Coley, Memorial Hospital, New York

*Bone Tumors* Exhibit of photographs, photomicrographs, roentgenograms and specimens dealing with bone tumors.

B. GUZMAN-BLANCO, Caracas, Venezuela, with the assistance of FRANK E. ADAIR, Memorial Hospital, New York

*Cancer of the Male Breast* Exhibit of photographs, photomicrographs, charts and specimens dealing with cancer of the male breast.

ENRIQUE VIACAVA, Buenos Aires, Argentina, with the assistance of HAYES E. MARTIN, Memorial Hospital, New York

*Cancer of the Lip* Exhibit of photographs, photomicrographs, charts and specimens dealing with cancer of the lip.

F. H. LAHEY and ASSOCIATES, Lahey Clinic, Boston

*Diseases of the Biliary Tract* Exhibit of photographs, drawings, roentgenograms and other descriptive matter covering certain aspects of the diagnosis and pathology of disease of the biliary tract, the technic of cholecystectomy and choledochostomy and the management of common duct strictures and of obstructions due to carcinoma of the head of the pancreas.

IRWIN SCHULZ, Milwaukee Children's Hospital, Milwaukee

*Winger Injury* Exhibit of photographs depicting experience in treating children with injuries serious enough to require hospital care. The following points are stressed: wringer injury is a clinical entity, the degree of injury may vary from slight contusion to necrosis and sloughing of skin, fat, fascia, nerve, vessels, muscle and even bone, many cases require skin grafting, damage to the hand may be permanent crippling, the degree and depth of damage are difficult to evaluate immediately after injury, progressive, serious tissue loss may be prevented by certain procedures applied early.

JOHN FALLON, JAMES T. BROSNAN and WILLIAM G. MORAN, Fallon Clinic, Worcester, Mass.

*Surgical Photography* Exhibit dealing with color still photography of lesions, operative fields and specimens, methods, apparatus, results.

J. ROSS VEAL and ROY G. KLEPNER, Gallinger Municipal Hospital, Washington, D. C.

*Treatment of Frostbite of the Extremities* Exhibit demonstrating the tissue and vascular changes in the various stages of freezing of the extremities in man, supplemented by experimental studies on animals, photomicrographs illustrating pathology of the tissue and vascular system, colored photographs of the three degrees of frostbite, arteriographs illustrating the vascular changes, a comparative study of the effects of exposure to cold in the normal, in the alcoholic and in those persons with preexisting vascular damage, outline of treatment for the various stages.

WILLIAM L. WATSON, Memorial Hospital, New York

*Cancer of the Thyroid* Exhibit of transparencies illustrating problems in diagnosis and treatment of cancer of the thyroid. The purpose of the exhibit is to correlate the diagnosis and treatment by radiation and surgery and a combination of the two.

RALPH M. WATKINS, Academy of Medicine, Cleveland

*Appendicitis in Cleveland* Exhibit showing a complete survey of all the cases of acute appendicitis, ruptured appendicitis with peritonitis and also with abscess which have occurred in the sixteen major hospitals of greater Cleveland in the past twelve years. Special emphasis is placed on the effects of delay in operation, economic status of the patient, the use of the sulfonamide drugs, the type of incision and the type of anesthetic. The analysis covers about 19,000 cases.

C. L. STRAITH, Detroit, E. H. DEKLEINE, Buffalo, and W. B. SLAUGHTER, Chicago

*Technic for Minimizing Scar Tissue Formation* Exhibit of photographs and drawings of methods used for minimizing scar.

formation in cases of prominent "stitch marks," "trap door scars," depressed scars with emphasis on utilization of Langer's lines, colored slides showing various types of scars

JOHN O BOWER, A E PEARCE, J C BURAN, H B TRACHTENBERG, J H CLARK, J G REINHOLD, I A TEPFIAN and G R KINGSLEY, Philadelphia General Hospital, Philadelphia

*Subclinical and Clinical Shock Accompanying Spreading Peritonitis—Its Recognition and Management* Exhibit dealing with 1 Clinical background prelethal shock is an accompaniment of death from spreading peritonitis, 94 per cent of so called appendicitis deaths are due to spreading peritonitis of 4,915 patients with spreading peritonitis, admitted to one hundred and eighty-one hospitals in Pennsylvania, 1,302, or 26 per cent died 2 Research background spreading peritonitis induced in dogs with results of therapeutic means, similarity of reaction of dog and man to spreading peritonitis is observed, description of the technic of induction and the laboratory recognition of subclinical and clinical shock accompanying spreading peritonitis The chemical changes in the blood and the composition of the peritoneal exudate in both man and dog shown by means of graphs Demonstration of a simple pump for the continuous administration of plasma or other fluids Chemical methods and apparatus employed to measure plasma and fluid deficiency and replacement, hematocrit, serum chloride, and the Kingsley direct buret method for rapid determination of plasma protein will be illustrated Hospital management—when and when not to operate The administration of parenteral fluids, plasma, saline and dextrose solution based on blood studies are graphically demonstrated

SAMUEL A THOMPSON and MILTON J RAISBECK, New York Medical College, New York

*Cardiopericardiopercy—The Surgical Treatment of Coronary Disease by the Establishment of Adhesive Pericarditis* Exhibit of charts, photographs, drawings and roentgenograms dealing with 1 Experimental work showing the possibility of producing adhesive pericarditis and methods used, mortality statistics of method when used in animals 2 Clinical work showing results of methods used in patients 3 Preoperative and postoperative care showing selection of patients, methods of diagnosis, postoperative findings, postoperative care and follow-up examinations

BOWMAN C CROWELL and FRED BOSSELMAN, American College of Surgeons, Chicago

*Organization and Growth of Cancer Clinics in General Hospitals* Exhibit showing the organization of cancer clinics in general hospitals, their growth and distribution in the United States

LEO M ZIMMERMAN, BARRY J ANSON and HAROLD LAUFMAN, Northwestern University Medical School, Chicago

*Anatomy and Surgery of Inguinal Hernia* Exhibit showing a study of the anatomy of the inguofemoral region, based on actual dissection of a large number of cadavers, with layer by layer drawings in the various abdominal types, as well as in the different forms of hernia The surgical therapy of hernia is approached from the standpoint of analysis of the actual lesion present in each type of hernia and the operative repair planned to meet the problems thus presented Sliding hernia is included in this study, as is also the medicolegal aspect of hernia, as interpreted in terms of the anatomy and etiology of the various types of hernia

ALFRED H IASON, Brooklyn

*Repair of Difficult Hernias* Exhibit of photographs, drawings, charts and pictures illustrating new technic and new instruments used in pedicled fascia lata transplant for difficult abdominal hernias the results are compared with other methods, an analysis of 60 cases is presented

CHARLES S WHITE, J LLOYD COLLINS and JACOB J WEINSTEIN, George Washington University School of Medicine and Gallinger Municipal Hospital, Washington, D C

*Clinical Analysis of Blood Plasma* Exhibit of charts summarizing studies in plasma and nitrogen balance in several sur-

gical conditions, notably shock, shock with hemorrhage, burns and hypoproteinemia also the effect of plasma transfusions, in hospital experience on the protein content hematocrit estimations blood count and blood pressures, the use of plasma and what may be expected from its use, the preparation, preservation and administration of plasma

JAMES C MASSON, Mayo Clinic, Rochester, Minn

*Use of Fascia Lata in Repair of Hernias* Exhibit of models transparencies photographs and instruments showing the technic of obtaining the preparation and the use of living sutures (fascia lata) in the repair of various types of hernias, such as inguinal hernias postoperative abdominal hernias, diaphragmatic, umbilical and vaginal hernias

GREGORY L ROBILIARD and ALFRED L SHAPIRO, Brooklyn Cancer Institute Brooklyn

*Operative Care of the Cancer Patient* Exhibit of charts, tables and photographs illustrating the special problems of preoperative and postoperative care in the cancer age group Incidence significance and management of concomitant degenerative diseases of middle age, i e, vascular and pulmonary in relation to radical resections Problems of increased susceptibility to shock, wound infection, fluid and nutritional imbalance Hypoproteinemia hypochloremia avitaminosis and anemia are correlated with mortality and morbidity in cancer surgery Preoperative lymphography by vital stains as an adjunct to demonstration and successful extirpation of drainage fields

DERYL HART and SAMUEL E UPCHURCH, Duke University School of Medicine and Duke Hospital, Durham, N C

*Air Disinfection with Bactericidal Radiant Energy* Exhibit of charts and photographs illustrating the degree of air contamination present in air conditioned and non-air conditioned operating room units the correlation of various intensity distributions of bactericidal radiant energy with the bactericidal effect throughout the operating room, and a comparison of the infection rates before the institution of bactericidal radiation with those obtained after the institution of bactericidal radiation in a variety of operative procedures, such as thoracoplasties, radical mastectomies, orthopedic operations, neurosurgical operations, hemorrhaphies and thyroidectomies

WILLIAM BATES, BERNARD D JUDOVICH and WINIFRED STEWART, Graduate Hospital, Philadelphia

*Relief of Pain* Exhibit of charts, graphs and case reports illustrating (1) a new form of therapy to aid in the control of intractable pain, the use of ammonium salts intraspinally and by local infiltration, relief of pain in a series of patients, including those with malignant conditions, tabes dorsalis, alcoholic neuritis, osteoarthritis and various forms of segmental and peripheral neuralgias, (2) the action of the ammonium ion on the nerve impulse, demonstrating the effect of optimal concentrations of the ammonium salts on the action current of sensory nerves, as shown by the cathode ray oscillograph, the correlation of clinical and laboratory results

R H ALDRICH, Boston

*The Triple Day Treatment of Burns* Exhibit of photographs and transparencies of various burns, charts showing mortality figures of burned patients from the Boston City Hospital, charts showing plasma loss with crust forming and non-crust forming substances, a study of the morbidity and complications in more than 3,000 burns will be shown in chart and diagram form

JAMES F KELLY and D ARNOLD DOWELL, Creighton University School of Medicine, Omaha

*Roentgen Rays in Prevention and Treatment of Infections* Exhibit of data bearing on the clinical and the scientific basis for the use of roentgen therapy in infections and the changes in the clinical signs and symptoms of infectious diseases when roentgen therapy is used, cases illustrating these changes are selected from those of gas gangrene and acute peritonitis, and the prevention of infection in recent injuries such as compound fractures and gunshot wounds

## Section on Obstetrics and Gynecology

The representative to the Scientific Exhibit from the Section on Obstetrics and Gynecology is Charles F. Galloway, Evans-ton, Ill.

I. H. FARRIS and C. S. HOIT, Department of Public Health, State of Illinois, and University of Illinois College of Medicine, Chicago

*Abortion* Exhibit of drawings, charts, transparencies and models together with blood agar plates of the more common organisms associated with septic abortion, the material covers (1) etiology, (2) therapeutic abortion, (3) pathology, (4) criminal abortion and (5) treatment of abortion. Statistical data, operative technique and the inhibiting action of corpus luteum extracts on the human uterine contractions are shown, dangers, complications and medicolegal aspects of criminal abortion are illustrated.

ARTHUR H. CURTIS, BARRY J. ANSON and TOM JONES, assisted by I. L. ASHLEY, I. F. BLYSON and C. B. McVAY, Northwestern University Medical School and University of Illinois College of Medicine, Chicago

*Gross Pelvic Anatomy in Relation to Gynecologic Surgery* Exhibit of drawings and models prepared from original dissections which were carried out in a planned serial succession, supplemented by a correlated set of drawings depicting certain surgical procedures in gynecology which are dependent on a knowledge of the anatomy illustrated.

WILLIAM BICKERS, Medical College of Virginia, Richmond

*Dysmenorrhea* Exhibit showing uterine contractions recorded by means of the intrauterine balloon during normal menstruation and during dysmenorrhea, the effects of certain drugs and hormones on the contractions, the pathologic physiology of dysmenorrhea and the rational approach to therapy.

R. A. WOODBURY, W. F. HAMILTON, RICHARD TORPIN, P. P. VOITTO, H. M. CHICKERY and B. E. ARRELL, University of Georgia School of Medicine, Augusta

*Effects of Pituitary Preparations, Ergonovine and Consultants on the Arterial Pressure* Exhibit showing that therapeutic doses of pituitary preparations which contain the oxytocic principle produce transient falls of 30 to 50 mm. of mercury in men and women, a similar fall occurs in the rabbit and chicken and to a slight extent in the turtle and cat, but not in the dog; the fall in blood pressure appears to be of cardiac origin, although there is no coronary constriction. When pituitary preparations are administered during parturition, the balance between the increased intrauterine and the arterial pressure is such that the placenta is dangerously deprived of maternal blood. Similar studies are presented with the drug ergonovine. Records are shown which allow an appraisal of the mechanisms contributing to the changes in arterial pressure during convulsions produced by metrazol, electric shock and strychnine.

ANNEFR I. WEISMAN, Department of Gynecology, Jewish Memorial Hospital, and CHRISTOPHER W. COATES, New York Zoological Society, New York

*A New Test for Pregnancy (the Xenopus "Frog" Test)* Exhibit presenting an explanation and description of the Xenopus (frog) test for pregnancy, together with the technique of extraction of urine and methods of injection of the Xenopus, and an actual demonstration of the pregnancy test. A positive reaction is denoted by the simple extrusion of eggs by the frog within six to eighteen hours after the injection of suspected urine. The extruded eggs are easily visualized by the naked eye, in the bottom of the test tank. From a series of tests performed in the last three years, this test has proved to be not only as accurate as the Aschheim-Zondek or Friedman test but more rapid, economical and simple to perform.

ROBERT L. DICKINSON and S. EMIEN STOKES, Sterilization League of New Jersey, Princeton

*Selective Sterilization for Human Betterment* Exhibit of sculptured panels showing normal anatomy and steps of operative procedure in vasectomy, and four methods of sterilizing the female.

CLARENCE J. GAMBLE, Milton, Mass.

*Contraceptive Technics Used in Public Health* Exhibit of posters showing histories and progress of the three state board of health pregnancy spacing programs in North Carolina, South Carolina and Alabama, reprints for distribution describing the development of these programs, contraceptive devices used in these programs, including the relatively new foam, powder and sponge method chosen by physicians for the majority of subjects in North Carolina and South Carolina, the method used by all subjects in the Alabama program will be shown.

ROSCOR W. TFAHAN, HOKE WAMMOCK and JAMES L. WLATHIRWAN, Jeanes Hospital, Philadelphia

*Treatment of Carcinoma of the Cervix by Interstitial Radiation* Exhibit showing that an important cause of failure to cure the patient with cancer of the cervix is believed to be related to the inadequacy and inconstancy of the dose of radiation reaching the outermost parts of the diseased area. In an attempt to overcome this, the authors have supplemented external roentgen radiation with radium placed interstitially in and about the cervix and in the broad ligaments. To place such radium needles more accurately, the abdomen has been opened in each instance. Stereoscopic roentgenograms of the area taken after implantation make it possible to determine with some accuracy the amount of radiation reaching various points in the diseased area. Experience gained in such distribution has made it possible to arrange the needles in such a manner that a greater amount of radiation reaches the lymph nodes at the pelvic wall. The results obtained from such treatment are encouraging.

L. M. RANDALL, M. C. PIPER, L. A. BRUNSTING and M. B. DOCKERTY, Mayo Clinic, Rochester, Minn.

*Kraurosis and Allied Lesions of the Vulva and Certain Neoplasms of the Ovary* Exhibit consists of (1) wax models, colored photographs, photomicrographs and short histories and findings demonstrating kraurosis and allied lesions of the vulva and (2) certain types of ovarian neoplasms demonstrated with the aid of colored wax models of selected specimens accompanied by description of the outstanding characteristics of each, together with photomicrographs.

JACOB HOFFMAN, Jefferson Medical College and Hospital, Philadelphia

*Operation of a Female Sex Endocrine Clinic* Exhibit of photographs of endocrinopathies and constitutional types, photomicrographs illustrating the human endometrial cycle and abnormalities thereof, schematic presentation of the endocrine factors concerned in menstrual and reproductive function, charts presenting hormone tests and their application, and accredited sex hormone preparations with their indications and evaluation.

## Section on Ophthalmology

The section exhibit committee of the Section on Ophthalmology consists of Georgiana Dvorak Theobald, Oak Park, Ill., chairman, Derrick Vail, Cincinnati, and W. Ivan Lillie, Philadelphia.

DONALD J. LYLE, Cincinnati

*Neuro-Ophthalmology* Exhibit showing anatomic, clinical and pathologic relationships in the field of neuro-ophthalmology, correlation of anatomic sections and specimens with clinical aspects including case history, field studies and retinal photographs, surgeon's report and specimen removed at operation or postmortem specimen and pathologist's report, photographs of sections and specimens of brain, retinal photographs and fields, gross and microscopic sections and specimens of brain.

T. L. TERRY, Massachusetts Eye and Ear Infirmary, Boston

*Fibroblastic Overgrowth of Persistent Tunica Vasculosa Lentis in Infants Born Prematurely* Exhibit of retrolental fibroplasia as found in 5 infants born prematurely. Colored illustrations show condition in various stages. Data relative to occurrence and treatment are included. Normal development and regression of the hyaloid artery and tunica vasculosa lentis are illustrated by reconstructions and drawings which include

the ophthalmoscopic appearance of eyes of normal premature infants. Other anomalies are shown related to the persistence of this vascular system.

G. A. SIETTER, BERNARD SAMUELS, CONRAD BERTAS, BRITTAIN PAYNE and E. B. BURCHELL, New York Eye and Ear Infirmary, New York.

*Macroscopic and Microscopic Ocular Pathology*. Exhibit showing gross pathology consisting of mounted hemisections of globes, photomicrographs of unusual slides and differential staining.

DAVID J. MORGENSTERN, New York Post Graduate Medical School and Hospital, Columbia University, New York.

*Intranasal Drainage for Cure of Chronic Tear Sac Infection*. Exhibit of diagrammatic illustrations of stages of procedure, instruments and demonstration on skull showing suitability of this technique, which is accurately guided by finger palpation at the inner canthus for difficult cases as in (1) narrow or fractured noses, (2) small thick-walled, granulation-filled, adhesion-bound sacs, (3) acutely inflamed sacs with threatening complications securing immediate drainage with the least possible surgical intervention and almost simultaneous sealing of vascular channels, adaptability in reestablishing intranasal drainage in previously excised tear sacs, summary of the advantages of this technique.

MARTIN COHEN, New York Post Graduate Medical School and Hospital, Columbia University, New York.

*Chorioretinal Arteriolar Necrosis in Malignant Hypertension*. Exhibit of colored drawings of the fundus and reproductions from photomicrographs of the retina, choroid and kidney, with brief legends and an abstract of the case report.

HENRI MINSKY, Mount Sinai Hospital, New York.

*The Zonular Chamber of the Eye*. Exhibit showing the lens-vitreous system isolated from fresh eyes by removing in saline solution the overlying structures. The vitreous hangs from the suspended lens by means of the zonular membrane's insertion into the vitreous at the hyaloretinal line. Pathologic slides are shown as presumptive evidence of a space being present in life. Final proof is offered of the existence of the zonular chamber by showing its being injected with carmine in fresh human eyes. From one single point of injection a posterior sinus beyond the processes fills up. This communicates by linear channels in the valleys of the ciliary body with the circumferential space. The anterior chamber fills at the same moment, showing that there exists a free opening of the zonular chamber into the posterior chamber. The role of the zonular membrane in accommodation, cataract extraction, detachment of the retina and glaucoma is suggested.

ISOBEL JANOWICH and ELEANOR BROWN MERRILL, National Society for the Prevention of Blindness, New York.

*Eye Problems in National Defense*. Exhibit of charts indicating industrial and civilian eye problems: (1) danger to eyes in air raids, (2) danger to glaucoma patients because of the unusual emotional stress, (3) illustrative material on eye hazards in industry.

L. VON SALLMANN, JAMES BOYD, EDWARD GALLARDO and PHILLIPS THYGESON, College of Physicians and Surgeons, New York.

*Sulfonamide Therapy in Ocular Infections*. Exhibit dealing with clinical studies on the treatment of ocular infections with sulfonamide compounds, emphasizing the local use of these compounds in ointment, emulsion and powder form and by iontophoresis. Experimental studies on ocular infections in laboratory animals are summarized.

JACOB GOLDSMITH, Mount Sinai Hospital, New York.

*Experimental Intracapsular Cataract Extraction, Suspensory Ligament and Hannover's Canal*. Exhibit dealing with further studies into the dynamics of the intracapsular cataract extraction, such as tumbling of the lens, external application of hook

inferiorly, separation of lens from vitreous (zonular fibers severed previously) and so forth. Further investigations into Hannover's canal, its contents, structure of its walls and so on. Serial microscopic sections from a normal adult eye and also from a normal adult eye which had undergone an intracapsular extraction (sagittal, transverse and coronal cuts). These sections take up the complete zonule of Zinn and all its closely related structures (lens, vitreous, ciliary body).

### Section on Laryngology, Otology and Rhinology

The representative to the Scientific Exhibit from the Section on Laryngology, Otology and Rhinology is Fred W. Dixon, Cleveland.

THOMAS J. COOK, Hospital of the University of Pennsylvania, Philadelphia.

*Oral Lesions*. Photographs of oral lesions, local in character, such as Vincent's infection and the oral manifestations of such systemic diseases as diabetes, syphilis, lichen planus, tuberculosis, leukemia and vitamin deficiencies.

CHUBBIE L. JACKSON, JOHN V. BRADY and CHARLES M. NORRIS, Temple University Hospital, Philadelphia.

*Criteria for Selection of Treatment in Cancer of the Larynx*. Exhibit presenting the results obtained in the treatment of a series of cases of cancer of the larynx by surgery and by irradiation since 1930. Demonstration of the criteria by which the particular method of treatment was selected in each of the surgical cases. The following criteria of selection are discussed and evaluated: (1) metastasis, (2) location and extent of lesion, (3) mobility of laryngeal structures, (4) histology and (5) general physical condition of patient. In instances in which recurrence took place an attempt is made to show the reasons for the recurrence and to correlate these data with our present concept of the criteria for the selection of a method of treatment.

ADA M. HILL, American Society for the Hard of Hearing, Washington, D. C.

*Information for the Hard of Hearing*. Exhibit giving information on hearing tests for children and adults, lip reading instruction, hearing aids, vocational and rehabilitation problems, conservation of hearing program in schools, individual problems of hard of hearing persons and local organizations for persons with impaired hearing.

RAPHAEL SCHILLINGER, Beth Israel Hospital, New York.

*The Nasal Sinuses in Allergy*. Exhibit of sinus roentgenograms of cases of known allergy, depicting the roentgen signs, the ability of the sinuses to accept contrast medium, the various types of filling characteristics and the ability or inability of the sinuses to empty themselves of the opaque fluid.

PAUL H. HOLINGER, University of Illinois College of Medicine, Chicago.

*Photography of Larynx, Tracheobronchial Tree and Esophagus*. Exhibit showing the photographic equipment devised to take motion pictures and still pictures of the larynx, tracheobronchial tree and esophagus; transparencies illustrate the normal appearance of the lower air and food passages and certain of their pathologic states; charts illustrate the technique of photography through the laryngoscope, bronchoscope and esophagoscope.

MAX CUTLER, LOUIS M. ROSENTHAL, E. VALENCIA and JAMES B. IRWIN, Chicago Tumor Institute, Chicago.

*Concentration Radiotherapy for Cancer of the Mouth, Pharynx and Larynx*. Exhibit presenting a new principle of radiotherapy known as the "concentration method," which has proved to be more effective in the radioresistant forms of cancer of the mouth, pharynx and larynx than the methods of external radiation now generally used; the clinical material on which the studies are based consists of some 850 cases of cancer of the mouth, pharynx and larynx from the Chicago Tumor Institute and the Veterans Administration Facility at Hines, Ill.; the principles, technique and results are illustrated by typical cases.

## Section on Pediatrics

The representative to the Scientific Exhibit from the Section on Pediatrics is Arthur F. Abt, Chicago

KATHERINE BAIN, Children's Bureau, United States Department of Labor, Washington, D. C.

*Maternal and Neonatal Mortality United States 1930-1940* Exhibit of charts and pictographs showing rates, trends and causes of maternal and neonatal mortality in the United States

RALPH BOWEN, Houston, Texas

*The Story of the Asthmatic Child* Exhibit presenting the allergic child and his experiences from infancy to juvenile life, stressing diagnosis and differentiation of asthma, something specific about foods, complete discussion as to therapy, environmental factors, role of infection and psychologic situations

JOHN H. BARNHART, DAVID GREENE, WALTER LEVY and NATHAN GREENSTEIN, Morrisania City Hospital, New York

*Prevention of Contagion in Pediatric Wards with the Use of Human Serum or Plasma* Exhibit presenting (1) the technique of our procedure and (2) the results obtained in our hospital compared with those obtained in other hospitals in a series of studies over a period of seven years on the subject of prophylaxis against contagious disease in pediatric wards by means of human serum or plasma

MARTIN M. MAJNER and HENRY BOKOW, Post Graduate Hospital, New York

*Congenital Heart Defects—Simplifying the Clinical Differential Diagnosis of the Most Common Types* Exhibit of clay models showing development of the fetal heart with defects as they occur, including two types of cyanotic (pulmonary stenosis and large septal lesion) and two types of acyanotic (patent ductus arteriosus and patent septum), charts show the pathologic changes and physiology of the different lesions, posters give simple differential data, electrocardiograms and stethograms of the lesions with recordings of common type murmurs and photographs of congenital conductive disturbances (complete heart block, right bundle-branch block, left bundle-branch block)

JOSEPH FLEISCH and WILLIAM WOLARSKY, the Bronx Hospital, New York

*Prevention and Treatment of Infectious Diarrhea of the Newborn with Lyophilic Plasma and Sulfathiazole* Exhibit of charts dealing with studies made of an outbreak among 108 newborn infants in which 19 infants were affected, chiefly premature infants weighing from 3 pounds 11 ounces to 6 pounds (1,672 to 2,722 Gm). None of those receiving prophylactic therapy contracted the disease. No mortality occurred among the babies who had contracted infectious diarrhea of the newborn and were treated with plasma-sulfathiazole. Limited but significant controls are shown. Epidemiologic, bacteriologic, serologic and experimental studies are presented.

J. HARRY MURPHY, Creighton University School of Medicine, Omaha

*Tuberculosis in Children* Exhibit of charts and graphs showing epidemiology of tuberculosis among children. Graphs dealing with survey in Omaha on the incidence of tuberculosis to the extent of approximately one tenth of the population, incidence of bovine tuberculosis found in Omaha packing plants, gross pathologic specimens of various tuberculous lesions found in children representing both primary and reinfection types, charts demonstrating extrathoracic lesions based on objective findings, operative or autopsy evidence.

## Section on Experimental Medicine and Therapeutics

The representative to the Scientific Exhibit from the Section on Experimental Medicine and Therapeutics is Dwight L. Wilbur, San Francisco

MILTON G. SCHMITT, Northwestern University Medical School, Chicago

*Treatment of the Pathology of Inflammation by Electromagnetic Induction* Exhibit of roentgenograms and photographs presenting representative cases comprising inflammatory conditions of traumatic and infectious origin treated by electromagnetic induction, including carbuncle, cellulitis of the face, infected hand with lymphangitis, nonunion of tibia and fibula (nine months' standing), osteomyelitis of tibia (postoperative treatment) and pneumonitis. The principles on which the technique is based are portrayed and explained by charts and diagrammatic illustrations, presenting a new concept of treatment whereby conditions heretofore considered contraindications may be safely and successfully treated.

WILLARD O. THOMPSON, NORRIS J. HECKEL and RICHARD F. MORRIS, University of Illinois College of Medicine, and Presbyterian Hospital, Chicago

*Endocrine Regulation of Growth* Exhibit showing variations from the normal in growth associated with hypofunction and hyperfunction of glands of internal secretion, with special emphasis on stimulation of growth with chorionic gonadotropin and sex hormones. Except for thyroid in patients with childhood myxedema, chorionic gonadotropin and male sex hormone are the most potent stimulators of growth available at present; they stimulate not only the growth of the skeleton but also the growth of every tissue in the body, in particular the musculature; they are general growth stimulators.

JOSEPH F. ROSS and MILAN A. CHAPIN, Evans Memorial and Massachusetts Memorial hospitals, Boston

*Application of Radioactive Isotopes to Medical Investigation* Exhibit illustrating the nuclear reactions occurring in the formation of radioactive isotopes and the principles of their production in the cyclotron, demonstrated with photographs and diagrams. Radioactive isotopes will be made artificially in the exhibit and the methods of detection of such "tagged" material will be demonstrated with a Geiger-Müller tube and counter. Application of the radioactive tracer technique to medical problems will be illustrated, particularly in reference to iron metabolism in human subjects. The path of radioactive iron in the body will be traced from ingestion until incorporation in the hemoglobin molecule.

WILLIAM DRESSLER, Israel Zion Hospital, Brooklyn, and the Brooklyn Hospital, New York

*Cardiac Topography and Physical Diagnosis of the Heart* Exhibit of drawings and photographs demonstrating (1) the anterior wall of the heart, which is the chief object of physical examination, and its topographic relationship to the anterior chest wall in various pathologic conditions, (2) a simple method of percussion aimed at finding abnormal areas of dullness rather than percussing the outlines of the heart, and the results of percussion in relation to cardiac topography, (3) significant palpatory findings in relationship to cardiac topography, (4) the diagnostic value of observation of the venous pulse with the unaided senses.

L. EMMETT HOLT, JR. and VICTOR A. NAJJAR, Johns Hopkins Hospital, Baltimore

*Simple Methods for the Determination of Early Deficiencies of Thiamine, Riboflavin and Nicotinic Acid* Exhibit consisting of a rotating display chart giving the background and advantages of the new procedure for assaying early vitamin B deficiencies, fluorocomparator designed by the exhibitors, which permits the average doctor with simple laboratory facilities to make assays of these vitamins by fluorescent methods without the aid of expensive electrical apparatus. Charts will describe the advantages of this instrument.

J. H. WEATHERBY and H. B. HAAG, Medical College of Virginia, Richmond

*Factors Influencing Skin Temperature* Exhibit of graphs illustrating changes in skin temperature of the fingers and toes as affected by various pharmacologic and physiologic influences such as smoking, reading, talking, drinking (cold be-

crages) and sleeping. Many of these factors induce changes in temperature of considerable magnitude. Such factors must be taken into account in the proper clinical evaluation of skin temperature changes. The experiments were done on a total of 24 healthy male and female subjects under controlled conditions, a suitable thermopile being used for recording the skin temperature.

HENRY R. KREIDER, Chemical Laboratory, American Medical Association, Chicago

*Recent Advances in the Chemistry of Synthetic Hormones, Gastric Antacids and Vitamin K.* Exhibit of charts and posters presenting a description of the chemical relationship and properties of the synthetic hormones, the natural and synthetic vitamin K active compounds, the substances which are used to counteract excessive gastric acidity in treatment of ulcers.

C. C. LITTLE, SAMUEL BINKLEY and H. D. FISHER, American Society for the Control of Cancer, New York

*Value of Cancer Research with Vit.* Exhibit of artificial stone, bas-relief plaques and color drawings emphasizing two main points: (1) the nature of the cancer process, illustrating the basic nature of growth in normal and cancerous tissue and means of control and propagation, (2) the nature of the material showing the advantages of uniform strains, ability to fix characteristics and provide in quantities, speed of reproduction and resemblance to human beings, furnishing a comparative basis for the extension of results.

A. G. DE SANCTIS, VINCENT DE PAUL LARSEN, MARTIN GREEN and PALL DI ST. AGNESE, New York Post Graduate Hospital, New York

*A Survey of 2000 Cases of Otitis Media and Mastoiditis in Children.* Exhibit presenting the changing picture of otitis media and mastoiditis over a ten year period, with special reference to the amazing results of chemotherapy in the past four years. A year by year breakdown of the important symptoms and physical signs as well as the pertinent laboratory data and complications of the last 1,000 cases of otitis media and mastoiditis is presented to show that there has been no significant change in the virulence of the disease but that modern methods of therapy are responsible. The normal yearly variation in the incidence of these two conditions is presented. Roentgenograms show the changes in mastoiditis under the influence of chemotherapy.

ASHER CHAPMAN and S. F. HAINES, Mayo Foundation, Rochester, Minn.

*Some Relationships of the Thyroid and Pituitary Glands to Iodine Metabolism.* Exhibit demonstrating results obtained in a study of certain thyroid-pituitary relationships in experimental animals, data showing that iodine in the thyroidless animal has a significant effect on growth and basal metabolic rate, evidence indicating that the thyroid may respond to the stimulus of low iodine in the absence of the pituitary gland, photomicrographs of pituitary glands demonstrate that different iodine levels in the body may effect the hypophyseal cytology in the absence of the thyroid gland.

HARRY KOSTER and BRUNO KISCH, Crown Heights Hospital, Brooklyn

*Some Physiologic Aspects of Spinal Anesthesia.* Exhibit showing the mechanism and the factors which govern the spread of the anesthetic in the subarachnoid space, the immediate absorption into the blood stream of the anesthetic is demonstrated, as is also its powerful depressor effect on cardiac muscle, the enzymatic changes that procaine hydrochloride undergoes in the blood stream with its conversion into innocuous substances are followed and the quantitative recovery in the urine is demonstrated, evidence which properly places the responsibility for the fall in blood pressure is presented, and the mechanism by which death may be produced or avoided is described.

GEORGE M. HICKEY and RAY D. WILLIAMS, Mayo Foundation, Rochester, Minn., and ARTHUR GATZ, Carleton College, Northfield, Minn.

*Reactions in Young Rats Fed Human Diets Low in the Vitamin B Complex.* Exhibit showing results of study in young rats fed human diets low in vitamin B complex. Recent surveys of food purchases by populations of the United States as well as other investigations of American diets showed that many families were consuming poor diets. Owing to their content of highly milled white flour and refined sugar, these diets failed to supply a satisfactory allowance of thiamine, riboflavin and nicotinic acid. Human diets composed of foods commonly appearing on American tables were prepared. They were adequate in vitamins A, C and D but were made to contain thiamine, riboflavin and nicotinic acid in amounts approximating those found in the 'poor' diets of human beings in the surveys. The B fractions were added to the patent flour, from which the breads of the various diets were made. These diets were fed to young rats.

E. FULLERTON COOK, JOHN N. McDONNELL, ADOLF B. NICHOLS and HARVEY P. FRANK, U. S. Pharmacopoeial Convention, Philadelphia

*United States Pharmacopoeia, Twelfth Revision.* Exhibit of charts and specimens presenting the items now official in the new Twelfth Revision of the Pharmacopoeia.

WILLIS C. BEASLEY, United States Public Health Service, National Institute of Health, Bethesda, Md.

*Evaluation of Technical Factors in Fluorography.* Exhibit of materials and instruments developed for this investigation illustrating procedures employed and quantitative results obtained from an intensive clinical and technical study of the relative diagnostic value of 35 mm and 4 inch by 5 inch fluorograms, and ones of intermediate size. Influences of the following technical factors on the diagnostic quality of miniature fluorograms are demonstrated: nature of roentgen ray generator, fluorescent screen, photographic lens, film size, image size, film emulsion, processing of films, methods of optical systems for viewing films, anode-screen distance and roentgen ray exposure factors. Special attention is given to the advantages of correct stereoscopic procedures over single films in diagnostic reading of miniature fluorograms.

ERICH KRUEGER and KLAUS LUNA, Post Graduate Medical School, New York, and Merck's Institute, Rahway, N. J.

*Comparative Studies on the Toxic Effects of Digitoxin and Ouabain.* Exhibit presenting experiments on cats which furnish evidence of qualitative differences between ouabain and digitoxin in their effect on heart rate and cardiac rhythm at different percentages of their total lethal doses. Ouabain was found to exert a stronger effect on the vagus. After ingestion of atropine a significant difference between the two drugs was not present. In these experiments use was made of the newly developed heart beat counter, which permits continuous recording of the heart rate and also observations on the electrocardiogram.

E. F. KELLY, American Pharmaceutical Association, Washington, D. C.

*National Formulary Preparations.* Exhibit of National Formulary Preparations of interest to prescribing physicians, examples of preparation of therapeutic importance representing convenient and satisfactory dosage forms, of vehicles designed to aid the physician in prescribing attractive and palatable prescriptions and of materials and preparations for use in the clinical laboratory.

DAVID ADLERSBERG, Mount Sinai Hospital, New York

*Fat and Vitamin A Absorption in Sprue and Sprue-like Conditions.* Exhibit showing that the rat tolerance test represents a reliable gauge of the absorptive capacity of the intestinal tract. Case histories, roentgenograms and graphs illustrate the relationship between the severity of the case, the clinical course, results of therapy and the behavior of the rat absorption test.

The test permits in some cases the differentiation between sprue and jejunoileitis. The absorption of vitamin A usually parallels fat absorption.

JOHN F. LEACH and JOSEPH H. FARROW, Memorial Hospital, New York

*Effect of Roentgen Rays on the Heart and Lungs* Exhibit presenting an experimental and clinical study of the effects of high voltage roentgen rays on the heart and lungs. The experimental studies include diagrams and photomicrographs of the early and late results of irradiating rat hearts. The clinical study shows the anatomic and physiologic disturbances occurring in the cardiopulmonary system when different types of extrinsic and intrinsic neoplastic diseases of the thorax are treated by high voltage roentgen rays. This study particularly emphasizes changes in the blood pressure, cardiac arrhythmia, respiratory physiology and electrocardiograms.

DAVID B. LISWACK, Jewish Hospital, Philadelphia

*A New Objective Circulation Time Test (Fluorescent Method)* Exhibit showing the method demonstrated in rabbits by injection of 10 per cent sodium fluorescein intravenously. A portable ultraviolet lamp with a Wood filter is directed toward the rabbit's eye, the time from injection of the dye until the appearance of a brilliant yellow in the iris and the lower palpebral conjunctiva denotes the circulation time, the average time in rabbits is five to six seconds. The effect of certain drugs on the circulation time of the rabbit will be shown on charts. Since the test of this circulation time is objective, it is of particular advantage in comatose, anesthetized, mentally ill and moribund patients. 3 cc. of 20 per cent sodium fluorescein being injected intravenously. This test has been done in several hundred human cases in normal cases and in compensated cardiac disease seven to fifteen seconds and in cardiac decompensation sixteen to forty-five seconds.

CHARLES I. SINGER, Long Beach Hospital, Long Beach, N. Y.

*Thalassotherapy* Exhibit of drawings, graphs and charts depicting the biologic effects of seashore climate in the human being and the rationale of its therapeutic indications and contraindications.

ASHER WINKELSTEIN, FRANKLIN HOLIANDER and ALBERT CORNELL, Mount Sinai Hospital, New York

*Drip Therapy of Peptic Ulcer* Exhibit showing the physiologic and psychologic bases of the various drip therapies, curves of neutralization of gastric acidity by the milk-soda drip and by alumina gel drips, a new apparatus used for the more usual alumina drips. Therapeutic results, modes of therapy and instructions for drip therapy will be presented, with a summary of ten years' experience with this new form of ulcer therapy.

DONALD SLAUGHTER and F. T. WRIGHT, Baylor University College of Medicine, Dallas, Texas

*A Quantitative Pain Threshold Machine* Exhibit showing how the original Wolff-Hardy Goodell machine has been modified to the extent that measurements of pain threshold in man are recorded as the degrees of centigrade temperature necessary to cause pain. This arrangement prevents any changes in the air currents circulating in or around the machine from altering the final reading at any one time. Such a precaution enables the operator of the machine to record the temperature the instant that pain is experienced by the subject and obviates the necessity of moving the subject away from the machine in order to make a thermocouple reading. It also corrects the problem of filament blackening of the lamp that is used as a source of heat pain, since the pyrometer readings are calibrated so that they represent certain degrees of centigrade temperature. The experiments performed on this machine consist of comparing various doses of opiates with and without 0.5 mg. of prostigmine methylsulfate.

## Section on Pathology and Physiology

The representative to the Scientific Exhibit from the Section on Pathology and Physiology is Frank W. Konzelmann, Philadelphia.

FRANK W. HARTMAN, VICTOR SCHELLING, HENRY N. HARKINS, BROCK BRUSH and KENNETH W. WARREN, Henry Ford Hospital, Detroit

*Relative Value of Pectin Solution in Shock* Exhibit showing a comparative study of blood substitutes, including pectin solution, in the prevention and treatment of shock. Data obtained from the treatment of experimental shock in animals with pectin solution and the use of the solution in prevention and treatment of shock in about 100 clinical cases are presented. The physical and chemical characteristics of pectin, along with the method of preparation of the solutions and tests for their safety in intravenous therapy, are illustrated.

MAX M. STRUMIA and JOHN J. MCGRAW, Bryn Mawr Hospital, Bryn Mawr, Pa.

*Preparation and Preservation of Human Blood Plasma* Exhibit showing all steps from bleeding of donors to final product, particularly the preservation in the frozen state, shell freezing and drying from the frozen state. The latter is accomplished with a new type of condenser which employs relatively high temperatures such as are readily obtained with standard small commercial refrigerating apparatus.

JOSEPH M. HILL, E. E. MUIRHEAD and LEWIS WATERS, Baylor University Hospital, Dallas, Texas

*Shock Therapy* Exhibit showing the rationale of hypertonic plasma protein therapy by demonstration of increased blood volume under various experimental conditions in dogs and human beings. Special emphasis is placed on water partition in shock and its shift to more normal distribution after hypertonic plasma therapy.

ISRAEL DAVIDSOHN, Mount Sinai Hospital, Chicago

*Blood Groups: Application in Clinical Medicine and in Medical Jurisprudence* Exhibit of a model demonstrating the blood grouping reactions, which visitors may work and observe for themselves, demonstration of the microscopic hemagglutination phenomenon, charts presenting the present status of knowledge of blood groups and their practical applications.

ERNEST E. AEGERTER and HENRY W. ZWERLING, Temple University School of Medicine and Hospital, Philadelphia

*Hodgkin's Disease* Exhibit presenting the essential features of the theories of etiology, symptomatology, clinical course, roentgen therapy and histopathology of the various types of Hodgkin's disease. These types include Hodgkin's disease of the mediastinum, retroperitoneum, lungs, gastrointestinal tract, skin, bone and brain.

ROBERT B. GREENBLATT, University of Georgia School of Medicine, Augusta, Ga.

*Testosterone Propionate Pellet Implantation in Gynecic Disorders* Exhibit of drawings illustrating the technic of implanting pellets of testosterone propionate subcutaneously in patients with (a) menorrhagia (b) dysmenorrhea (c) menopausal syndrome (d) fibromyomata uteri (e) nocturnal frequency or (f) sexual frigidity, charts showing the doses required in various gynecic disorders, graphs showing the rate of pellet absorption, photomicrographs of microscopic studies of the endometrium and the vaginal smear before and after implantation as well as the histopathology of tissue changes about the pellets, photomicrographs of sections of the vagina taken for biopsies and stained especially for glycogen illustrate that implantation of pellets in a moderate dose does not interfere with glycogen deposition.

GONZALO ESGUERRA GOMEZ, Clinica de Marly, Bogota, Colombia

*Bone Changes in Leprosy* Exhibit of roentgenograms showing bone changes in leprosy.

ANNE SHIRAS and ALBERT LEVIN, Biological Photographic Association, Pittsburgh

**Medical Photography** Exhibit of prints and transparencies illustrating the use of photography in various branches of medicine. Complete descriptions of technique are available. A scientific photographer qualified to discuss problems of medical photography will be in attendance at all times. The pictures shown were submitted by a number of photographers, members of the National Biological Photographic Association.

ELAINE P. RALIK, KARL PALFY and STYMOUR RINZLER, New York University College of Medicine, New York

**Human Liver Lipids in Health and Disease—In Analysis of 120 Human Livers** Exhibit of charts showing graphically the distribution of fat in the human liver in health and disease. Analysis of 25 normal livers and 95 livers of patients dying from cirrhosis of the liver, acute and chronic infections, heart disease, diseases of metabolism and malignant diseases, also cases in which the plasma lipids were analyzed before death and the liver lipids were analyzed after death, photomicrographs of the pathologic livers.

NORBERT LAZER, ERNST SIMONSON and SIMONE BLOKSTEIN, Mount Sinai Hospital, Milwaukee

**Investigations of Sensory and Motor Centers in Fatigue and Disease** Exhibit showing that because the fusion frequency of flicker is a fundamental visual function and is an indicator of the excitability of visual centers, it was used to study some of the central nervous system factors in fatigue and general disease. Charts show that the fusion is diminished in normal fatigue of the central nervous system, patients with cardiac disorders and hypothyroidism were found to have depressions of the fusion; the fusion was found to rise as fatigue was relieved, amphetamine, desoxyephedrine, vitamin B complex surplus raised the fusion in normal states, methyltestosterone achieved the same results in hypogonadism. Charts demonstrate fatigue of the motor centers in normal states and in disease and the effect of amphetamine and desoxyephedrine.

EMMERICH VON HAAS, A. F. PREBUS and MARY SCHULZ, Ohio State University, Columbus, Ohio

**Supramicroscopy** Exhibit demonstrating studies of cytologic details in the electron microscope, survey over the possible uses of this instrument in medicine: photomicrographs of thrombocytes, mitochondria, chromosomes, bacteria, viruses and biologic colloids.

S. E. GOULD, Eloise Hospital, Eloise, Mich.

**Sublethal Trichinosis** Exhibit of photographs and drawings illustrating diagnostic tests for trichinosis during life and methods of recovery of *Trichinella spiralis* at autopsy. The results of cutaneous tests and precipitation tests with one or more trichina antigens and of blood counts for eosinophilia are correlated with the finding of *Trichinella* larvae at autopsy in several hundred persons.

W. J. MACNEAL, MARTHA JANE SPENCE and ARTHUR C. ALLEN, New York Post Graduate Medical School and Hospital, New York

**Comparative Study of the Lesions of Clinical and Experimental Endocarditis** Exhibit of gross specimens and photographs and photomicrographs of the lesions in the heart and in other organs in human viridans endocarditis and in the experimental infection produced by inoculation in rabbits.

WILLIS S. KNIGHTON and MARK J. SCHÖENBERG, Glaucoma Committee of the National Society for the Prevention of Blindness, New York

**Glaucoma** Exhibit of charts, photographs, drawings and specimens presenting the subject of glaucoma for the general practitioner and the ophthalmologist.

CARLOS MONTE, Faculty of Medicine, University of San Marcos, Lima, Peru

Exhibit dealing with research work in the university.

O. IVANISSEVICH, University of Buenos Aires, Buenos Aires, Argentina

**Hydatid Cysts** Exhibit indicating the importance of the disease in the province of Buenos Aires.

JOHN A. SAXTON, Cornell University Medical College, New York, and C. M. MCCAY, GRADY A. SIMON and LEROY L. BARNES, Laboratory of Animal Nutrition, Cornell University, Ithaca, N. Y.

**Relation of Chronic Nephrosis, Chronic Pneumonia and Neoplastic Diseases of Albino Rats to Age and Modification of Diet** Exhibit showing experiments on the relation of diet and growth rate to the life span and to common spontaneous diseases of albino rats. The exhibit demonstrates the pathology and, so far as possible, the pathogenesis of chronic nephrosis, chronic pneumonia and neoplasms of rats. The frequency of these diseases in relation to age and to the diets employed is shown in tabular form. The analyses lead to the conclusion that modifications of diet and growth rate may modify the development of spontaneous diseases in the rat and in this way affect the average life span.

LALI G. MONTGOMERY, CARITA R. SWANSON, American Society of Clinical Pathologists, Ball Memorial Hospital, Muncie, Ind., and GRANT LAVORITE, Philadelphia

**The Pathologist Contributions to American Medicine** Exhibit illustrating the many ways in which the pathologist takes his place in the community in which he works, the many contributions that he makes to national medicine as an individual and through the American Society of Clinical Pathologists, and how important a role he plays in the maintenance and advancement of the high standards of American medicine.

CARLOS CHACAS, Faculty of Medicine, University of Rio de Janeiro, Rio de Janeiro, Brazil

**Epidemiologic Studies on Malaria and Chagas Disease in Brazil** Exhibit showing work carried out by the Service de Estudo das Grandes Endemias (Division for Studies of Endemic Diseases) of the Instituto Oswaldo Cruz, Rio de Janeiro, malaria survey of the Amazon Valley, the survey of Chagas disease in several states, parasitologic studies on *Schizotrypanum cruzi*.

**Research Studies of the Biophysics Laboratory of the Faculdade Nacional de Medicina Rio de Janeiro** Exhibit showing (1) rhythmic properties of tissue culture—technic, results and oscillograms, (2) parasitologic studies in tissue culture—culture of *Schizotrypanum cruzi*, culture of toxoplasma and micropreparations, (3) qualitative aspects of the electric discharge of the electric eel—oscillograms.

MILTON MENDLOWITZ and ALAN LESLIE, Mount Sinai Hospital, New York

**Clubbed Fingers and Hypertrophic Osteoarthropathy** Exhibit of transparencies describing the production of experimental cyanosis and hypertrophic osteoarthropathy in the dog by anastomosis of the pulmonary artery to the left auricle, and also studies of blood flow and blood pressure in human clubbed fingers.

J. W. CUTLER and FELIX R. PARK, Phipps Institute and Graduate Hospital, Philadelphia

**New Technic for Sedimentation Rate** Evidence showing that lack of a universally accepted technic for recording sedimentation rate has been a serious block to a more widespread adoption of this simple test in general practice, a technic based on the fundamental fact that it is the size of the rouleaux that determines the rate of settling is described, this technic is precise, simple and time saving and embodies principles applicable to all tubes, the results are expressed in simple figures, are easy to interpret and need no correction for anemia, evidence is presented that the 1 cc. Cutler tube is a practical tube for sedimentation rate determination, giving reliable and accurate results under average conditions.

## Section on Nervous and Mental Diseases

The representative to the Scientific Exhibit from the Section on Nervous and Mental Diseases is F. P. Moersch, Rochester, Minn.

IRMA J. CARY and LEO C. MASSOPUST, Marquette University Medical School, Milwaukee

*Experimental Imbored Motion of Motion of Motor Nerve Plates* Exhibit of specimens, charts and photomicrographs showing that the pleomorphism of the motor nerve plates and muscle striations are experimentally related to physiologic and pathologic functions. By excitation and depression of the nervous system there is demonstrated a correlation between the morphologic structure and the capillary chemistry of muscle and nerve. Periodic bands analogous to cross striations in muscle are experimentally produced by capillary chemical activity in glass tubes. The morphologic evidence of periodic expansion and retraction of motor nerve plates in striped muscle supports the chemical theory for the transmission of the impulse from nerve endings to muscle. Acute stricture results in "mautition block" of nerve impulse with great expansion of axons outside of muscle fiber and retraction and uprooting of nerve branches in motor end plate.

HENRY R. VINTS and ROBERT S. SCHWAB, Massachusetts General Hospital, Boston

*Myasthenia Gravis* Exhibit of charts, photographs, tracings of ergographic and electromyographic records, statistics, the prostigmine test, postmortem studies of thymic gland and endocrine investigations, medical and surgical treatment showing recent progress in the diagnosis and treatment of the disease. The material is brought up to date based on the records from the Myasthenia Gravis Clinic of the Massachusetts General Hospital.

KNOX H. LINTY and C. MACH CAMMILL, Harvard Medical School and Boston Psychopathic Hospital, Boston

*Electroencephalographic Studies in Neuropsychiatric Disorders* Exhibit showing electroencephalographic tracings compiled from records obtained on more than 4,000 neuropsychiatric patients. Charts show a variety of samples from different neuropsychiatric conditions: schizophrenia, manic depressive disorders, involutional psychoses, behavior problems in childhood and adolescence, neurosyphilis, epilepsy, narcolepsy and other conditions. The charts include samples of tracings followed during the course of a psychosis, including tracings obtained on patients with neurosyphilis before, during and after treatment. Samples of electroencephalographic tracings from experimental studies on animals including the influence of stimulation of the hypothalamus on the electrical cortical pattern are illustrated.

ROBERT V. STIGER, Johns Hopkins Hospital, Baltimore and MERRILL MOORE, Washington Hospital, Boston

*Treatment of Alcoholism* Exhibit outlining the method of treatment of alcoholism in a modern hospital in which the alcoholic is considered a sick person and is treated accordingly, methods of examination and procedures of therapy, special techniques of approaching the alcoholic patient and aiding him in dealing with his problems, psychologic and psychiatric studies and social service methods, special method of handling an alcoholic patient on a farm.

SAMUEL RICHARD ROSIN, Blythewood, Greenwich, Conn., KARL A. FORKERS, Plainfield, N. J., and KLAUS UNNA, Mountside, N. J.

*Beta-Erythroidine Hydrochloride, Its Pharmacology and Clinical Application to the Control of Metrazol Seizures* Exhibit of botanical and chemical material illustrating the development of the investigation of the Erythrina alkaloids as a background to the pharmacologic and clinical investigations of beta-erythroidine hydrochloride, the clinical use of the drug in the control and mitigation of the seizure induced by metrazol is discussed.

JAMES R. LISA and SIDNEY W. GROSS, City Hospital, Welfare Island, New York

*Brain Tumors in General Postmortem Examinations* Exhibit of brain tumors including many of unusual pathologic interest from the point of view of clinical history, location and histology, during the past several years many brain tumors, silent or unrecognized clinically, have been found during routine general postmortem examinations.

HAROLD C. VORIS and HERBERT LANDES, Mercy Hospital and Loyola University Clinics, Chicago

*Management of the Neurogenic Bladder* Exhibit of cystometrograms and electrocystometrograms that demonstrate the normal and pathologic physiology of the urinary bladder are portrayed with diagrams and actual demonstrations.

## Section on Dermatology and Syphilology

The representative to the Scientific Exhibit from the Section on Dermatology and Syphilology is Hamilton Montgomery, Rochester, Minn.

C. GUY LANE and IRVIN H. BLANK, Harvard Medical School, Boston

*Cutaneous Detergents* Exhibit showing classification of cutaneous detergents now available according to their chemical composition, chemical composition of soap, how detergents remove soil from the surface of the skin, the action of detergents (principally soap) on the skin.

ORLANDO CANIZARES, New York

*History, Development and Achievements of Dermatology in Latin America* Exhibit presenting a brief summary of the history, development and present status of dermatology and syphilology in Latin America, each country being studied separately, their most outstanding achievements, textbooks, dermatologic journals and monographs on different subjects of the specialty, pictures, moulages and brief descriptions of the cutaneous tropical diseases and their treatment, pictures of hospitals and medical institutes related to dermatology.

RHODA W. BENHAM and JANE CRAIGHEAD, College of Physicians and Surgeons, Columbia University, New York

*Cultural Characteristics of the Dermatophytes as Influenced by the Culture Medium* Exhibit showing that the composition of culture mediums influences the production of pigment and the development of the characteristic structures by which species of Dermatophytes are identified, there seems no one medium best for identification of all species, a comparison of gross and microscopic characteristics of several important species is demonstrated on various mediums which seem of value in identification.

F. M. DOUGLASS and T. L. RAMSEY, St. Vincent's Hospital, Toledo, Ohio

*Magnesium Silicate Granulomas* Exhibit of photomicrographs of lesions produced by crystals of magnesium silicate (talcum powder), lesions as seen in color by ordinary illumination and the use of polarized light, brief clinical abstracts of case histories.

G. H. FAGET, United States Marine Hospital, Carville, La.

*Leprosy—Clinical Types and Roentgenograms Showing Bone Changes* Exhibit of (1) photographs showing all types of leprosy in their various stages: maculoanesthetic, neural, tuberculous, lepromatous and mixed, (2) serial photographs showing progress of the disease during the course of years, (3) photomicrographs showing pathology and bacteriology, (4) roentgenograms of hands and feet showing neurotrophic bone absorption occurring in leprosy in different stages of the process.

H. J. TEMPLETON, C. J. LUNSFORD and H. V. ALLINGTON, Oakland, Calif.

*Dermatologic Oddities* Exhibit of photographs of the oddities of the skin—the bizarre rather than the rare dermatoses—such as photographs of "India rubber skin men" rather than a rarity such as lichen ruber moniliformis.

S WILLIAM BECKER, Department of Medicine, University of Chicago, Chicago

*Cutaneous Melanoblasts as Studied by the Paraffin Dopa Technique* Exhibit of a chart giving directions for performance of the paraffin dopa technic, photographs and photomicrographs of tissue previously treated by levorotatory 3,4-dihydroxyphenylalanine for demonstration of pigment-forming cells of the skin, various dermatoses are illustrated

GEOFFREY WILLIAM RAKE, MORRIS F SHAFTER CLARA M MCKEE and HELEN JONES Squibb Institute for Medical Research, New Brunswick, N J

*Lymphogranuloma Venereum* Exhibit showing the present knowledge of the agent of lymphogranuloma venereum including its morphology, developmental cycle, tinctorial characteristics and antigenic structure, the relationship of the agent to viruses and bacteria and more particularly its relationship to the agents of psittacosis, meningopneumonitis and allied diseases, recent developments in knowledge of the epidemiology of the disease as revealed by new and more sensitive diagnostic tests, with particular bearing on its persistent and latent character, recent observations on the chemotherapy of the disease under experimental conditions

V PARDO-CASTELLO and FRANCISCO R TIANI, University of Havana Medical School, Havana, Cuba

*Leprosy The Correlation of Its Clinical, Immunologic, Pathologic and Bacteriologic Aspects* Exhibit of photographs of lepromatous, tuberculoid and nonspecific types of leprosy affecting the skin and peripheral nervous system, photomicrographs of cutaneous and nerve lesions of the three pathologic types, photographs and photomicrographs of "lepromin" tests on the skin, posters explaining the correlation between the clinical skin and nerve lesions, the pathologic types, the results of the lepromin test and bacteriologic examinations, special stress is laid on early lesions of leprosy and their diagnosis, with reference also to the histamine test

R A VONDERLEHR and LIDA J USILTON, Division of Venereal Diseases, United States Public Health Service, Washington, D C

*Prevalence of Syphilis Among Selectees* Exhibit of a map showing the prevalence of syphilis among selectees by states and counties

CHARLES WALTER CLARKE, FRANK C COMBES, HELEN O CURTH, ARTHUR GRACE, BORRIS A KORNBLITH, MURRAY SANDERS and GUSTAV I STEFFEN, American Social Hygiene Association, New York

*The Minor Venereal Diseases—Lymphogranuloma Venereum, Chancroid and Granuloma Inguinale* Exhibit of charts, photographs and methods used in diagnosis and treatment of lymphogranuloma venereum, chancroid and granuloma inguinale, presenting the latest information with regard to the prevalence, epidemiology, diagnosis and treatment of these three diseases, diseases being especially prevalent in the tropics and subtropics are of considerable importance at the present time by the Army and Navy

#### Section on Preventive and Industrial Medicine and Public Health

The representative to the Scientific Exhibit from the Section on Preventive and Industrial Medicine and Public Health is Paul A Davis, Akron, Ohio

RAUL F VACCAREZZA, ALVARO E BENICE, ALFREDO LANARI, FRANCISCO LABOURT and R GONZALEZ SEGURA, Catedra de Patologia y Clinica de la Tuberculosis, Buenos Aires, Argentina

*Results Obtained from the Examination of Separate Lungs* Exhibit showing that (1) bronchospireometry of separate lungs, by means of Gebauer's catheter and following the method of Jacobaeus, is an advisable procedure in patients who are submitted to surgical collapse therapy, (2) residual air has the same chemical composition as alveolar air, provided the extraction is done simultaneously, (3) aspiration of 100 cc of residual air

of a lung produces an atelectatic picture which disappears immediately after reventilation of the lung, (4) the recording of cardiopneumatic movements of separate lungs shows a record closely related to those of auricular activity with a few accidents of ventricular origin, on both sides

RAUL F VACCAREZZA and JUAN R PASO, Catedra de Patologia y Clinica de la Tuberculosis, Buenos Aires, Argentina

*Epidemiology of Tuberculosis in Argentina—Its Influence on the Human Economic Value* Exhibit of charts on tuberculosis mortality in Argentina for the last twenty-five years, according to age and sex groups and to political divisions of the country, comparative values of population, mortality as a whole and tuberculosis mortality during the years 1914 and 1936, ranking of tuberculosis among the principal causes of death in various years and different age groups, the tuberculin average for driftees from different provinces and territories, vital statistics charts on tuberculosis mortality in the city of Buenos Aires for the years 1914 and 1936 (census years), curve showing the human economic value in Argentina and incidence of tuberculosis and cancer on the same

WHILDARD MACHIE, E W SCOTT and E J LARGENT, Kettering Laboratory, College of Medicine, Cincinnati

*Fluoride Metabolism* Exhibit showing results of balance study of the normal fluoride intake and of high amounts added to the diet of the human subject, summarized in charts and graphs, accompanied by related information showing sources and distribution of fluoride, results of an animal feeding study presented in roentgenograms, photographs and photomicrographs

BERTRAM P BROWN and KARL F MEYER, State Department of Public Health, San Francisco

*Bubonic Plague—Field Work and Control* Exhibit showing that plague is endemic on the Pacific slope, where it is demonstrated chiefly in ground squirrels and their fleas. Human outbreaks, bubonic and pneumonic, have occurred in California in 1900, 1907-1908, 1919 and 1924-1925, sporadic cases have occurred during intervening years. Incidence, distribution, field and laboratory activities, specimens of ground squirrels and other rodents that are involved in the distribution of the disease, pathologic specimens, slides and the like are shown

REGINALD FITZ and ANNA C HOLT, Harvard Medical School Library, Boston

*"Something Curious in the Medical Line"—History of Smallpox Vaccination* Exhibit portraying certain curious features of the introduction of vaccination into America, showing that the beginning of a task so vital to our national health as the prevention of smallpox depended largely on the friendship between two doctors who never met

NATIONAL DEPARTMENT OF HEALTH OF BRAZIL, Service of Studies and Investigations of Yellow Fever, Rio de Janeiro, Brazil

*Yellow Fever in Brazil* Exhibit of maps showing known occurrence of yellow fever, 1930-1941, places in which epidemiologic studies on yellow fever have been made, areas in which mass vaccination against yellow fever has been done, studies of distribution of immunity to yellow fever for determination of past epidemics, localities with a representative authorized to collect liver specimens, places in which antimosquito services operated during 1941, original distribution of *Aedes aegypti*, known distribution of *Aedes aegypti*, last quarter 1941

NATIONAL DEPARTMENT OF HEALTH OF BRAZIL, Malaria Service for the Northeast, Rio de Janeiro, Brazil

*The Story of the Eradication of Anopheles (Myzomyia) Gambiae from Brazil* Exhibit of maps showing the spread and retraction of *Anopheles gambiae* and of the area surveyed for its possible extension, photographs of the terrain, breeding places, technic employed and the like, charts showing the number of adults and larvae found each month, indicating that in some divisions these mosquitoes have not been found for more than two years, while in the last division cleaned, they have not

been found for more than one year, chart showing the number of persons treated for malaria, by months, chart showing the personnel employed, by months and by divisions

CARL M. PETERSON, Council on Industrial Health, American Medical Association, Chicago

*Physical Examinations in Industry* Exhibit of charts, posters and other illustrative material designed to acquaint the private practitioner with the scope, techniques and results of preemployment and periodic health services in industry

CARL F. JORDAN and IRVING H. BORIS, Iowa State Department of Health, Des Moines, Iowa

*Brucellosis or Undulant (Malta) Fever* Exhibit showing photographs of farm animals in a rural setting, charts to indicate distribution of reported cases according to occupation, month of onset and sex, reported incidence in Iowa as compared with other states, study of Bang's disease and a minor milk-borne outbreak caused by *Brucella* of porcine type, consideration of symptomatology, laboratory diagnostic procedures, pathology and therapeutic and control measures

JOHN C. BUCHHE and MANUEL ROCA-GARCIA, Section of Special Studies, National Department of Health, Bogota, Colombia

*Epidemiology of Jungle Yellow Fever* Exhibit of charts, photographs and mounted specimens of animals showing the essential characteristics of jungle yellow fever and the mechanism by which it is spread among the animals of the jungle. The means by which the virus may be conveyed to man and the clinical characters of the disease are demonstrated

HUGO I. D'AMATO, National Department of Health of the Argentine Republic, Buenos Aires, Argentina

*Activities of the National Department of Health of the Argentine Republic* Exhibit showing health activities in Argentina as follows: (a) General Malaria Service—maps showing infected zones and percentage of infected persons and treatments, designs and photographs of automatic siphon with intermittent discharge, educational poster (b) Division of Maternal and Infant Welfare—graphs showing maternal and infant mortality and morbidity, functional sketch of a child health center (c) Bacteriologic Institute—diagnosis of diphtheria (d) Section of Hygiene—chart with clinical classification of congenital heart lesions (e) Leprosy—photographs of sanatorium colonies in operation

JAMES S. McLISTER, NORMAN JOHNSON, T. D. SPILL, R. M. WILDER and F. C. BING, Council on Foods and Nutrition, American Medical Association, Chicago, and Food and Nutrition Board, National Research Council, Washington, D. C.

*Dietary Deficiency Diseases* Exhibit of charts and pictures, together with informal discussion, of signs, symptoms and treatment of dietary deficiencies

HUGH S. CUMMING, Pan American Sanitary Bureau, Washington, D. C.

*Public Health in Latin America* Exhibit of drawings, maps and photographic montages representing (1) extent of library of Pan American Sanitary Bureau and medical journalistic production of Latin America, (2) field services of the Bureau, (3) some Latin American hospitals and institutions, (4) present status of plague in Latin American ports and its almost complete eradication, (5) increase in recent years of national funds allotted for public health work in Latin America, (6) the international reporting of communicable diseases to and from the Pan American Sanitary Bureau, (7) the drop in smallpox and general death rates in Latin America, (8) outstanding medical contributions of Latin America

HAROLD W. SMITH, Bureau of Medicine and Surgery, Navy Department, Washington, D. C.

*The Medical Department of the United States Navy* Exhibits of charts, posters, photographs and moulages pre-

sented various aspects of the activities of the Medical Department of the Navy. Photofluorographs will be shown with a photofluorography machine in operation

### Section on Urology

The representative to the Scientific Exhibit from the Section on Urology is John H. Morrissey, New York

EDWARD O. FINISTONI, Harlem Hospital, New York

*A New Concept of Urinary Extravasation* Exhibit of charts, posters and photographs showing a new concept of the pathogenesis and treatment of urinary extravasation. As a result of this new concept the mortality was definitely diminished and the operative results were accomplished without mutilation. Experiments consisted of the controlled injection of Colles' pouch with radiopaque colored fluids followed by serial roentgen rays and dissection. Clinical studies were based on an intimate analysis of 32 cases observed during the past ten years

ROGER W. BARNES, Los Angeles

*Endoscopic Prostatic Surgery—Some Details of Technique* Exhibit of drawings of sagittal sections and cystoscopic views of numerous details of the technique of endoscopic prostatic surgery

FREDERICK M. ALLEN, OTIS M. COPE and WILLIAM E. YOUNG, New York Medical College, New York

*Renal-Vascular Studies* Exhibit showing new blood pressure methods, influence of diet on blood pressure, size of the kidney and body weight, acute and chronic hypertension with kidney ligations and other procedures, kidneys explanted under skin and outside skin, other functional and morphologic observations

R. H. RIGDON, University of Tennessee, Memphis, Tenn.

*Renal Lesions Following the Intravenous Injection of Hypertonic Solutions of Sucrose and Dextrose—Clinical and Experimental Observations* Exhibit of charts and photomicrographs of the kidneys from a group of clinical cases given hypertonic solutions of sucrose with intake and output of fluid on 1 patient, renal lesions produced by the intravenous injection of hypertonic sucrose in the rabbit and showing retention of nonprotein nitrogen in the blood. These experimental lesions are similar to those observed in man. Observations on the effect of hypertonic solutions of dextrose on the retention of nonprotein nitrogen and on the kidney of the rabbit are included

LOWRAIN E. MCCREA, Temple University Medical School, Philadelphia

*Cystoscopic Photography—Its Application in the Practice of Urology* Exhibit of photographs showing many normal and pathologic lesions of the bladder, models showing normal and pathologic lesions observed through the view finder of the original camera, transparencies in color of sagittal sections of the human body, showing the introduction of the cystoscope and the application of the cystoscopic camera

NICANDRO CHAVEZ, Faculty of Medicine, National University of Mexico, Mexico City, Mexico

*Venereal Disease Control in Mexico* Exhibit of photographs, charts, posters and lantern slides depicting methods of treatment and control of venereal diseases in Mexico

EUGENE R. WHITMORE, Georgetown University Medical School, Washington, D. C.

*Tumors of the Kidney* Exhibit of photographs and photomicrographs of tumors of the kidney in children and in adults, tumors of the renal pelvis and calices and cortical tumors, discussion of the nature of the different types of kidney tumors, whole organ microsections of the kidney, showing the relation of the tumor to the neighboring kidney tissue, the extension of the tumor and the nature of different portions of the tumor

### Section on Orthopedic Surgery

The representative to the Scientific Exhibit from the Section on Orthopedic Surgery is Jesse T. Nicholson, Philadelphia

DONALD GUTHRIE and PAUL H. HARMON, Robert Packer Hospital, Sayre, Pa.

*Arthroplasty of Hip with Nonmetallic Foreign Body Cup* Exhibit of photographs, transparencies and roentgenograms illustrating case histories and operative procedures employed in arthroplasty of the hip.

HOWARD A. CARTER and S. PERRY ROGERS, Council on Physical Therapy, American Medical Association, Chicago.

*Amputations* Exhibit displaying the work of the consultants on artificial limbs of the Council on Physical Therapy. Preferred sites of election for amputations, the best stump for the most useful prosthesis and acceptable methods for treatment of the stump are considered. Manikins are displayed illustrating satisfactory stumps. A pamphlet will be distributed, dealing with the important aspects of the exhibit.

WILLIAM J. TORIN, Station Hospital, Fort Benning, Georgia.

*Parachute Injuries* Exhibit showing the types of fractures that have been sustained in the training of the paratroops, accurate statistics of the number of jumps, injuries—both minor (contusions, sprains, lacerations and like injuries) and major—fractures and other serious injuries. Conclusions drawn from a survey of the injuries will be included in the exhibit.

BRADLEY L. COLEY and NORMAN L. HIGGINS, Memorial Hospital and Hospital for Special Surgery, New York.

*Skeletal Manifestations of Caisson Disease* Exhibit of charts and photographs presenting the etiology, roentgenology, pathology and differential diagnosis illustrating the features of the skeletal manifestations of caisson disease.

HENRY BRIGGS, New Jersey Orthopaedic Hospital, East Orange, N. J.

*Chip Fusion Following Exploration of the Spinal Canal (Low Lumbar)* Exhibit of anatomic specimens showing method of chip fusion following low lumbar exploration of the spinal canal, roentgenograms preoperative and postoperative in a number of cases, charts of statistics following removal of a ruptured nucleus pulposus, spondylolisthesis and other conditions of the low back.

CHARLES GILFILLAN, KENNETH TOWNSEND, ALONZO NEUFELD and G. MOSSER TAYLOR, College of Medical Evangelists, Los Angeles.

*Recent Advances in Internal Fixation of Fractures* Exhibit showing a new type of bone plate and bone screws, the technique for its application and various uses and advantages illustrated by photographs, drawings and skeletal specimens. A new type of self-tapping screw with the plates and a recently developed form of internal fixation for intertrochanteric and subtrochanteric fractures (Neufeld nail). A series of more than 150 cases in which these forms of internal fixation were used are analyzed by means of charts and diagrams.

EARL D. MCBRIDE and WILLIAM K. ISHMAEL, Bone and Joint Hospital, McBride Clinic, Oklahoma City.

*Plated Osteoperiosteal Bone Graft* Exhibit of roentgenograms and demonstration of technique of a method of applying a vitallium plate directly over the osteoperiosteal graft across the ununited fracture. The advantages are security, the fact that graft heals firmly to fragments, promotes osteogenesis, can be done in recently infected tissues, often affords graft from same leg; there is no necessity of freshening partially healed fracture and it saves time.

R. K. GHORMLEY and M. B. COVENTRY, Mayo Clinic, Rochester, Minn.

*Degenerative and Pathologic Changes in Lumbosacral Intervertebral Disks* Exhibit of lumbosacral disks through the

various decades of life showing degenerative changes and pathologic specimens of disks which have been removed at post-mortem examination.

J. S. STEED and HAROLD B. BOYD, Willis C. Campbell Clinic, Memphis, Tenn.

*Treatment of Bone Defects with Dual Bone Grafts and Fibular Transplants* Exhibit of roentgen ray prints and photographs illustrating the treatment of severe nonunions, especially those near joints, by means of the dual bone graft. The use of the dual bone graft in the treatment of congenital pseudarthrosis, bridging of defects in bone with fibular grafts following loss of bone substance due to gunshot wounds and compound fractures.

M. B. HOWORTH, New York Orthopaedic Hospital, New York.

*Evolution of the Spine Fusion* Exhibit of wax models, photographs, roentgen transparencies, specimens, instruments, braces and microscopic slides illustrating the original Hibbs operation with modifications in technique to date, including present technique and application together with postoperative care. The method is used for Pott's disease, scoliosis, fracture, lumbar sacral anomalies and spondylolisthesis, and cases of rupture of nucleus pulposus.

#### Section on Gastro-Enterology and Proctology

The representative to the Scientific Exhibit from the Section on Gastro-Enterology and Proctology is GRANT H. LAING, Chicago.

FREDERICK STEIGMANN, HANS POPPER and KARI A. MEYER, Cook County Hospital, University of Illinois College of Medicine and Cook County Graduate School of Medicine, Chicago.

*Liver Function in Clinical Medicine* Exhibit showing that a knowledge of the functional status of the liver is of increasing importance for diagnosis and treatment of various conditions. Pathology and physiology of the liver are demonstrated by charts, photomicrographs and fluorescence microscopy from the point of view of their clinical application. The present role of liver function tests in diagnosis, prognosis and indication for surgical intervention is illustrated and evaluated on the basis of liver biopsies. The indications and the significance of the liver function tests in various clinical conditions are discussed. An attempt is made to show the influence of therapeutic procedures on the liver function.

J. MENENDEZ FEROS, Service of Pedro A. Castillo, University of Havana, Havana, Cuba.

*The Electrocardiogastragram* Exhibit of the electrocardiogastragram, a new method used to explore the stomach by means of a thin rubber tube which has two electrodes. This is introduced into the stomach and the stomach filled with 400 cc of a conductor and buffer solution and the electrodes connected to an electrocardiograph. The graphs that are registered vary with the voltage in relation to the pathologic condition of the gastric mucosa, it is low in inflammatory processes and high in normal or pure carcinomatous involvements. This work has been checked up with gastroscopic, radiographic and pathologic examinations.

J. RUSSELL VERBRYCKE, JR., Washington, D. C.

*Treatment of Cardiospasm* Exhibit of charts, posters, roentgenograms and lantern slides showing the results of studies based on 654 cases of spasmodic obstruction at the cardia, indications for technique of hydrostatic dilation, with results.

THOMAS N. HOBAN and C. GRAHAM EDDY, Eloise Hospital and Harper Hospital, Detroit.

*Laparoscopy Intra-Abdominal Photography in Color* Exhibit consisting of (1) historical review of the development of the instrument and a demonstration of the Swedish model, (2)

demonstration of a newly designed trochar, lamp-housing and spring arrangement for the purpose of taking photographs in color within the abdomen, special high intensity lamps are shown, (3) wash-off relief prints of intra-abdominal photographs in color and Kodachrome enlargements showing technic of intra-abdominal photography, direct aspiration of bile from the gallbladder, liver biopsy and photomicrographs of biopsy specimens, evaluation of laparoscopic photography as an aid in diagnosis.

MALCOLM R. HILL, F. HAROLD SHRYOCK and F. GEORGE RIBBITT, College of Medical Evangelists, Loma Linda and Los Angeles

*Role of the Anal Glands in the Pathogenesis of Anorectal Disease.* Exhibit consisting of models and photomicrographs representing a study of the development and structure of the anal glands in various age groups with emphasis on their relationship to anorectal disease.

HENRY A. RASKY, Lenox Hill and Beth Israel hospitals, New York

*Intraoperative Photography in Conjunction with Gastrosocopy.* Exhibit of gastrophotographic studies made in a series of patients who presented diagnostic and therapeutic problems. The studies were made in conjunction with the use of the flexible gastroscope. The gastroscope was inserted and the area that was the site of interest was noted. The distance or the depth of the instrument was outlined on the flexible tube to which the camera was attached. The latter was then inserted into this depth. The endoscopic and photographic studies, which were taken mostly in natural colors, were compared to the operative findings as well as the subsequent clinical course. These facts are illustrated by transparencies describing the case reports, the method employed in taking the gastrophotographs is also illustrated.

HAROLD LINCOLN THOMSON, Los Angeles

*Gastrosocopy in Surgery—Results in 250 Cases.* Exhibit of charts, photographs, roentgenograms and drawings collected from 250 cases wherein gastrosocopy was used in surgical conditions of the stomach.

W. WAYNE BABCOCK and HARRY E. BACON, Temple University Medical School, Philadelphia

*Surgical Treatment of Cancer of the Colon, Rectum and Anus Without Colostomy.* Exhibit presenting illustrations, apparatus, mouldages, colored slides and photographs and tables illustrating the diagnosis and surgical removal of cancer of the colon and rectum with retention of a perineal anus. The techniques of four operations are shown: (1) perineal proctosigmoidectomy, (2) abdominoperineal proctosigmoidectomy, (3) Mikulicz-Paul sigmoidectomy, (4) one clamp end to end method of single stage resection of colon. Preoperative and postoperative treatment. Premalignant and malignant lesions on mechanized turntable viewed through the sigmoidoscope. Indications for and advantages of aspiration. Illustration of advantages of metallic ligatures and sutures.

LOUIS H. CIERF and C. WILMER WIRTS, Jefferson Medical College and Hospital, Philadelphia

*Flexible Tube Gastrosocopy.* Exhibit of (1) an apparatus containing a Wolf-Schindler flexible gastroscope with a dial that may be turned to give the viewer a picture of the stomach as actually viewed through this instrument, (2) slides of correlated gastrosocopic and roentgen studies of a group of patients, (3) a series of drawings made at the time of the original examination through the gastroscope, (4) a series of charts

illustrating the findings from the examination of more than 1,500 patients—particularly emphasizing the problem of gastric carcinoma.

Z. BIRCOVITZ, R. C. PAGE, H. K. RUSSELL and C. C. FULLER, New York Post-Graduate Medical School and Hospital, New York, and St. Agnes Hospital, White Plains, New York

*Metabolic Studies in Chronic Ulcerative Colitis.* Exhibit of charts and graphs showing the results of studies on patients with chronic ulcerative colitis, oral and intravenous dextrose tolerance tests and basal metabolism and respiratory quotient determinations being made simultaneously on some patients. Comparative studies were made with oral dextrose and oral dextrin tolerance tests. Prothrombin clotting time determinations were made with the Russell viper venom modification of Quick's method. Vitamin A and carotinoid blood plasma studies and vitamin C plasma level studies were carried out. Capillary fragility determinations were made in cases of chronic ulcerative colitis and the relationship to vitamin C plasma level and rectal bleeding were studied.

### Section on Radiology

The representative to the Scientific Exhibit from the Section on Radiology is S. W. Donaldson, Ann Arbor, Mich.

H. E. KLEINSCHMIDT, National Tuberculosis Association, New York, and S. REID WARREN JR., Moore School of Electrical Engineering, University of Pennsylvania, Philadelphia

*Chest Roentgenograms—Common Technical Errors and Their Correction.* Exhibit showing a series of roentgenograms, all of the same chest, illustrating mistakes in technic commonly made, how these faults may lead to error in diagnosis and how to correct them, a pair of stereo films as nearly perfect as can be made with ordinary apparatus.

WILLIAM BAILEY, Medical School of the University of Southern California, Los Angeles

*Methods of Treating Hemangiomas.* Exhibit comparing the different methods of treating hemangiomas, results from the use of sclerosing solutions, carbon dioxide snow, roentgen rays and beta and gamma rays of radium with special reference to unsatisfactory results, the importance of the depth effect in treating the deeper type of hemangiomas and the usual dosages for all the different methods of treatment are given.

P. L. FARINAS, University Hospital, Havana, Cuba

*Mucosography of the Organs of the Respiratory Tract.* Exhibit of roentgenograms demonstrating the internal surface of the mucosa of the respiratory organs after the pulverization of an opaque substance.

LEE A. HADLEY and THEODORE SNOOK, Syracuse University College of Medicine, Syracuse, N. Y.

*Intervertebral Foramina.* Exhibit showing wet and dry specimens of the intervertebral foramina, together with roentgen studies and stained sections illustrating both normal and abnormal conditions.

RAPHAEL POMERANZ, Newark, N. J.

*Osteomyelitis of Skull.* Exhibit of charts discussing the etiology, types and spread of the disease, transparencies showing serial roentgenographic study of bone changes in osteomyelitis of skull, correlation of the roentgen examination with the clinical course and blood serum findings, differential diagnosis from other infectious diseases of the skull, such as tuberculosis, syphilis and blastomycosis, results of operative and conservative therapy (sulfathiazole) in some of these cases, pictures of specimens with summary and conclusions.

O. V. BATSON, Graduate School of Medicine, University of Pennsylvania, Philadelphia

*The Vertebral Venous System as a Mechanism for the Spread of Metastases.* Exhibit of anatomic specimens, serial radiographs, photographs and drawings demonstrating injection

experiments as well as the anatomic extent of the vertebral venous system. Injecting the prostatic vein plexuses in the cadaver or in the living monkey, fills the vertebral veins and simulates the pattern of spread found in prostatic carcinoma so that without entering the heart or lungs the cervical vertebrae and the brain have been injected in the cadaver. Injections of other anatomic regions show that the vertebral veins with the veins of the trunk wall and the veins of the head and neck, form a large venous system the so-called vertebral vein system which while joining the other venous systems also form a by-pass around them.

FRANK S. DOLLEY and LYMAN A. BREWER, Los Angeles

*Intrathoracic Tumors* Exhibit of neoplasms including those originating from the chest wall, lung and mediastinum, showing the preoperative roentgenogram, preoperative symptoms and history, together with a colored transparency of the neoplasm itself after surgical removal. These tumors include dermoid, teratoma, fibrosarcoma, neuroganglioma, fibromyxosarcoma, mediastinal lipomatosis, osteochondroma, osteochondrosarcoma, isolated pulmonary carcinoma undifferentiated diagnosis diaphragmatic hernia, coccidioidal abscess and pyogenic abscess.

J. DE CARIJAL-FOPERO, Warner Institute for Therapeutic Research, and JAMES L. MCCARTNEY, New York

*Radiography of Soft Tissues by Monochromatic X-Radiation* Exhibit of roentgenograms demonstrating soft tissues in proportion to their different densities without sacrificing bone detail and density. Bone structures, such as in the pelvis, where the depth is not uniform, are brought out clearly with equal or almost equal density throughout and yet the soft tissue structures are visualized. Early pregnancies, fibroids and placentas (in pregnancy) are shown. Complete differentiation of skin, subcutaneous tissue, muscular layers, tendinous attachments, vascular and pulmonary structures and bones is possible by this method. Pathologic conditions such as varicose veins, ruptured tendons and subcutaneous tumors can be demonstrated. The method includes darkroom processing in color-forming developers in which the amount of dye deposited on the emulsion is proportional to the actinic activation of the silver at that point.

HENRY K. TAYLOR and TERESA MCGOVERN, Welfare Hospital, Welfare Island, New York

*Angiocardiography* Exhibit showing roentgenographic visualization of the chambers and large vessels of the heart with the aid of contrast substance: the anatomy of the heart and large vessels, location of the heart chambers, variations in the pulmonary circulation, obstructions in the superior vena cava, and collateral circulation, kymographic studies with the differentiation of mediastinal lesions.

CHARLES S. CAPP and MARTHA MOTTRAM, University of California Hospital, San Francisco

*Bone Lesions Involving the Sacrum* Exhibit of roentgenograms coupled with a short history and important clinical manifestations of more than forty conditions, anomalies, metabolic lesions, primary neoplastic and metastatic neoplastic conditions and unusual fractures.

#### Section on Anesthesiology

The representative to the Scientific Exhibit from the Section on Anesthesiology is Paul M. Wood, New York.

GEORGE W. JONES, United States Bureau of Mines, and GEORGE I. THOMAS, St. Francis Hospital, Pittsburgh

*Noninflammable General Anesthesiology—Partial Replacement of Oxygen with Helium in Anesthetic Mixtures* Exhibit illustrating the results of the cooperative investigation by the Bureau of Mines, United States Department of the Interior, the St.

Francis Hospital of Pittsburgh, the University of Pittsburgh and certain manufacturers of anesthetic equipment for eliminating inflammable mixtures of agents used in anesthesiology by replacing with helium part of the oxygen. Noninflammable anesthetic mixtures containing helium have been routinely administered with highly satisfactory results at the St. Francis Hospital for the past two years. This exhibit is built around the technical work of the Bureau of Mines and practical applications at the St. Francis Hospital.

E. A. ROSENSTINE, HOMER W. SMITH, E. M. PAPPER and S. E. BRADLEY, New York University College of Medicine, New York

*Circulatory Changes During Spinal Anesthesia* Exhibit of charts, drawings and diagrams demonstrating the effects of spinal anesthesia on the circulation. Results of studies on normal man not operated on and studies conducted during clinical anesthesia. Measurements on the nonsurgical series were completed with the ballistocardiograph, the arterial manometer and the electrocardiograph. Certain studies were directed toward the renal circulation with the use of the diodrast and the inulin clearance method.

RICHARD FOREGGER, Wisconsin General Hospital, Madison, Wis.

*Surface Temperature Studies Under Anesthesia* Exhibit of graphs showing the use of skin temperature changes as a means of measuring the increase of peripheral blood flow during anesthesia, normal subjects under pentothal, spinal and inhalation anesthesia, with the resultant skin temperature rise, skin temperature recordings under pentothal, spinal, inhalation and lumbar sympathetic block anesthesia on patients with vascular disease.

PALL M. WOOD, American Society of Anesthetists, New York

*History of Carbon Dioxide Absorption* Exhibit of models, apparatus, letters and literature showing the history of the development of carbon dioxide absorption for respiratory purposes in anesthesia.

L. H. MOUSEL, H. W. SCHMIDT and A. H. BULBULIAN, Mayo Clinic, Rochester, Minn.

*Causes, Prevention and Treatment of Postoperative Atelectasis* The most frequent pulmonary complications are the result of aspiration or secretions from the nasopharynx during operation. A thorough understanding of the anatomic features and physiologic factors of the larynx and tracheobronchial tree is essential to prevent such complications. Important precautions to be taken preoperatively are emphasized as preventative measures. Treatment should be directed toward securing an adequate endobronchial drainage by means of hyperventilation or bronchoscopy.

HAROLD F. BISHOP, Walter Reed General Hospital, Washington, D. C., and FRED F. RUDDER, Emory University Medical School, Atlanta, Ga.

*Intravenous Anesthesia—Management of Administration* Exhibit of charts and posters showing types of cases, total number of cases, length of operations and amount of drug given (smallest dose, largest dose and average dose to each group of cases), complications: (a) time of operation and (b) post-operatively, contraindications, results of anesthesia (pentothal sodium). Photographs and drawings of an apparatus so devised that one anesthetist, without assistance, has absolute control over the drug at all times. The drug may be given drop by drop only as needed. Advantages are that (1) the capacity of a 50 cc. syringe allows completion of the majority of operations without its being necessary to refill the syringe, (2) no back flow into the needle is possible thereby preventing occlusion of the needle by clotting, (3) it allows saline solution

dextrose solution, plasma and citrated blood to be given through the same needle without disturbing the anesthetic, (4) the apparatus is adjustable in any position

JOHN ADRIANI, Louisiana State University School of Medicine, New Orleans

*Effect of Anesthetic Drugs on Bronchial Tissue* Exhibit of photomicrographs showing the reactions of excised bronchial tissue of rat dog and man to anesthetic drugs and the modification of these responses by autonomic stimulating and depressing drugs such as atropine, scopolamine, epinephrine and ephedrine. The drugs used are ethylene, cyclopropane, nitrous oxide, ether, vinyl ether, chloroform, ethyl chloride, tribromethanol, paraldehyde, evipal, pentothal, pentobarbital sodium and other barbiturates, and amylene hydrate

### MOTION PICTURES

Motion pictures will be shown continuously throughout the week in four motion picture theaters adjoining the exhibits. Each picture will be shown once each day.

#### Practice of Medicine

A. WILBUR DUKAKI and GERALD H. PRATT, New York Post-Graduate Hospital, New York

*Large Popliteal Aneurysm—Surgical Repair*

CLAYTON J. LUNDY, Rush Medical College, Chicago

*Heart Beat Mechanism in Health and Disease Part 9 The Common Distal Effects on the Electrocardiograms Part 10 Axis Deviation*

J. F. F. RISMAN, Beth Israel Hospital, New York

*Diagnosis and Treatment of Inguinal Hernia*

NORMAN PLUMMER and CHARLES WHEELER, New York Hospital, New York

*Sulfonamide Therapy*

GORDON B. MYERS, FRED MARGOLIS and MEL CLAPPER, Wayne University College of Medicine, Detroit

*Physical Diagnosis*

#### Surgery

HUGH A. GAMBER, Gambel Brothers and Archer Clinic, Greenville, Miss

*Radical Amputation of the Biceps with Improved Cantery Technique*

ARABEL M. VAUGHN, Mercy Hospital, Loyola University School of Medicine, Chicago

*High Saphenous Vein Ligation with Retrograde Injection*

GEORGE CRUE JR., Cleveland Clinic, Cleveland

*Thyroidectomy for Diffuse Goiter with Hyperthyroidism*

SAM S. SAMUELS, Bellevue Hospital, New York

*Treatment of Diabetic Gangrene*

HAROLD L. FOSS, Geisinger Memorial Hospital, Danville, Pa

*Resection of Right Colon with Primary End to End Anastomosis in One Stage for Carcinoma of the Cecum*

*Thyroidectomy in Treatment of Diffuse Goiter with Hyperthyroidism*

*Total Hysterectomy*

ALFRED H. IASON, Brooklyn

*Cholecystectomy and Appendectomy for Gangrenous Cholecystitis and Chronic Appendicitis*

*Pedicled Fascia Lata Transplant for a Large Postoperative Incisional Hernia in the Right Upper Part of the Abdomen*

*Story of Bile Demonstrating in Animation the Histology and Physiology of the Liver, Gallbladder, Biliary Ducts and Duodenum*

JAMES L. MUDD, St. Louis University Medical School, St. Louis

*Ligation of the Persistent Ductus Arteriosus Complicated by Streptococcus Viridans Endarteritis with Recovery*

FRANK S. DOILEY, Los Angeles

*Surgical Technique in Pericardiotomy for Adhesive Pericarditis*

*Ligation of Patent Ductus Arteriosus*

*Preoperative and Operative Technique in the Care of Lung Abscesses*

#### Symposium on Surgical Technique

FRANK H. LAHEY and ASSOCIATES, Boston

*Excision of Thyroglossal Cyst*

*Esophageal Diverticulum—Lahey Two Stage Operation for Diverticula of the Pulsion Type*

*Subtotal Thyroidectomy for Primary Hyperthyroidism*

*Excision of Adenomatous Thyroid*

*Cholecystectomy and Choledochostomy for Chronic Cholecystitis and Cholelithiasis*

*Subtotal Gastrectomy for Chronic, Intractable Peptic Ulcer*

*Modified Mikulicz's Resection of the Right Colon for Carcinoma, Two Stage Operation*

*Abdominoperineal Resection for Carcinoma of the Rectum, One Stage, Miles*

*Abdominoperineal Resection of the Rectum for Carcinoma—Two Stage Operation*

*Posterior or Perineal Resection of the Rectum for Carcinoma*  
*The Removal of an Intrathoracic Goiter*

#### Orthopedic Surgery

J. E. M. THOMSON and C. FRED FERCIOT, Lincoln, Neb

*Transportation in Back Injuries*

M. B. HOWORTH, New York Orthopedic Hospital, New York

*Technique of Spine Fusion*

HAROLD B. BOYD, Willis C. Campbell Clinic, Memphis, Tenn

*Treatment of Bone Defects with Dual Bone Grafts and Fibular Transplants*

DONALD GUTHRIE, Guthrie Clinic, Robert Packer Hospital, Sayre, Pa

*Arthroplasty of Hip with Nonmetallic Foreign Body Cup*

WILLIAM J. TOBIN, Washington, D. C., and Station Hospital, Fort Benning, Georgia

*Parachute Injuries*

HENRY BRIGGS, New Jersey Orthopaedic Hospital, East Orange, N. J.

*Hemiation of a Low Lumbar Nucleus Pulposus, Diagnosis and Treatment by Laminectomy and Chip Fusion*

DEAN H. ECHOLS and GUY CALDWELL, Tulane University of Louisiana School of Medicine, New Orleans

*Sciatic Pain Caused by Ruptured Intervertebral Disk*

#### Nervous and Mental Diseases

J. RUDOLPH JAEGER, Denver

*Intervertebral Disk (Hemiated Nucleus Pulposus)*

*Abscess of Brain*

*Subdural Hematoma*

FREDERICK LEMERE, Shadel Sanitarium, Seattle

*Conditioned Reflex Treatment of Chronic Alcoholism*

A. E. BENNETT, University of Nebraska, Omaha

*Curare as a Diagnostic Test of Myasthenia Gravis*

*Horse Serum Nephritis*

S P GOODHART, B H BAISER and TRACY J PUTNAM, New York

*Unusual Types of Extrapyramidal Syndromes Including Sigulae of Epidemic Encephalitis*

HAROLD C VORIS, Loyola University Medical School and the Cook County Hospital, Chicago

*Operative Treatment of Head Injuries*

DAVID J IMPASTATO and RENATO AIMASSI, New York University Medical School, New York

*Technic and Clinical Manifestations of Electrofit Therapy*

SAMUEL RICHARD ROSEN, Blithewood, Greenwich Conn  
*Erythrina Paralysis*

#### Miscellaneous Motion Pictures with Sound

R A VONDERLEHR, Division of Venereal Diseases, United States Health Service, Washington, D C

*Syphilis Part I Diagnosis of Early Syphilis*

*Part II Diagnosis of Late and Latent Syphilis*

*Part III The Management of Syphilis*

DAVID N W GRANT, Office Chief of Air Corps, United States Army, Washington, D C

*The Physical Examination for Flying*

CHARLES S WHITE, Washington, D C

*The Story of Plasma*

RAPHAEL SCHILLINGER, Beth Israel Hospital, New York  
*Nasal Sinusitis*

MALARIA SERVICE FOR THE NORTHEAST, National Department of Health of Brazil, Rio de Janeiro, Brazil

*The Anti-Gambio Campaign in Northeastern Brazil*

JOHN C BUGHEN, Section of Special Studies, National Department of Health, Bogota, Colombia

*Study and Control of Jungle Yellow Fever*

CARLOS CHAGAS, National Faculty of Medicine, Rio de Janeiro, Brazil

*Tissue Culture*

MALCOLM T MACEachern, American College of Surgeons, Chicago

*White Battalions—Serving All Mankind*

GEORGE BAEHR, Office of Civilian Defense, Medical Division, Washington

*Emergency Medical Service for Civilian Defense (Film slides with sound)*

#### Miscellaneous Motion Pictures—Silent

HARRY A TOWSLEY, University of Michigan Medical School, Ann Arbor

*Immunization Against Infectious Diseases*

J HARRY MURPHY, Creighton University School of Medicine, Omaha

*Tuberculosis in Children*

R R PARKER, Rocky Mountain Laboratory, Hamilton, Mont.  
*St Louis Encephalitis in Horses*

THEODORE ROSENTHAL, Bureau of Social Hygiene, Department of Health, New York

*Diagnosis of Gonorrhea in the Male*

FRANCIS PASCHER, Skin and Cancer Unit, Post-Graduate Hospital, Brooklyn

*Dermatologic Illness*

HAROLD W SMITH, Bureau of Medicine and Surgery, Navy Department, Washington, D C

*The Naval Dental Corps*

*The Naval Medical Officer*

ABRAHAM WEISMAN, Jewish Memorial Hospital, and CHRISTOPHER W COVATIS, New York Zoological Society, New York

*A New Test for Piquancy (The Xenopus "Frog" Test)*

FRANK E SIMMONS, The Simpson Radium Institute, Chicago  
*Radon Treatment of Cancer of the Cervix Uteri*

CHARLES J GANNON, Milton, Mass

*The Biology of Conception*

*Technics of Contraception*

PAUL H HOLMES, University of Illinois College of Medicine, Chicago

*Color Cinematography Through the Laryngoscope, Bronchoscope and Esophagoscope*

SAMUEL ICHNER, College of Medicine, University of Cincinnati, Cincinnati

*Approaches to the Surgical Spaces of the Neck*

HENRY MINSKY, Mount Sinai Hospital, New York

*The Zonular Chamber of the Eye*

JACOB GOLDSMITH, Mount Sinai Hospital, New York

*Continued Studies on Experimental Intracapsular Cataract Extraction and Hanner's Canal The Complete Suspensory Ligament from Serial Sections (Microscopic)*

THOMAS N HORAN, Eloise Hospital, Detroit

*Laparoscopy*

DAVID MILLER, College of Medical Evangelists, Los Angeles

*Motion Picture Photography of the Rectum and Rectosigmoid*

ROBERT TURELL, Mount Sinai Hospital, New York

*Tattooing with Mercuric Sulfide for Intractable Pruritus Ulvae and Ani*

W WAYNE BABCOCK and HARRY E BACON, Temple University Hospital, Philadelphia

*Surgical Treatment of Rectal Cancer*

WILLIS C BEASLEY, National Institute of Health, Bethesda, Md

*Thoracic Cine Fluorography*

#### Awards

There will be two groups of awards in the Scientific Exhibit consisting each of (a) gold medal, (b) silver medal, (c) bronze medal, (d) certificates of merit and (e) honorable mention

[NOTE—The special subsidized exhibits (fractures and backache) and the exhibits of the headquarters of the American Medical Association are not open to awards]

#### GROUP I

Awards in group I are made for exhibits of individual investigations, which are judged on basis of originality and excellence of presentation

#### GROUP II

Awards in group II are made for exhibits that do not exemplify purely experimental studies but which are judged on basis of the excellence of correlating facts and excellence of presentation

# THE TECHNICAL EXPOSITION

★

*One of the  
Outstanding  
Features  
of the  
Atlantic City  
Session . . . .*

★

TO the visiting physician as well as to the participating exhibitor, the Technical Exposition this year may well bring a deep feeling of pride. For here will be displayed the newer and more important products of an industry which is as vitally necessary in war as in peace—an industry which goes hand in hand with the physician in maintaining the health of 130,000,000 Americans whether in the home, in the factory, or in the armed forces.

Physicians will, therefore, find it advisable to spend the maximum amount of time in visiting and studying the many interesting exhibits which will make up the Exposition. Practically every single exhibit will offer to the visitor something of immediate interest—a new product, an improvement over an old product, a new technique, or new scientific information—presented by charts, mechanical displays or by skilled technicians and researchers.

Altogether more than 200 firms will participate in the Technical Exposition. Leading medical publishers will have at hand a full showing of their newest books as well as the standard works. Virtually every pharmaceutical manufacturer will have new products or new information to present. Instrument, apparatus, and supply houses will show vast arrays of new and standard items, and producers of foods for infant feeding and other special purposes will show how closely they are following the newest developments in nutrition.

Because the Technical Exposition, the Scientific Exhibits, General Sessions and Section Meetings will all be held within the Atlantic City Auditorium, physicians will find it convenient to visit exhibits before and after meetings. The Technical Exposition is really one of the practical, educational features of the Annual Session and time given to it every day will prove a splendid investment.

Exhibits will be open each day from 8:30 A. M. to 6:00 P. M., closing at 4 P. M. Friday. On the following pages are brief descriptive items giving a preview of most of the exhibits.

WILL C. BRAUN, *Director of Exhibits*

## APPARATUS AND INSTRUMENTS

**A. B. STOVES, INC.**  
Booth 10 H

An ambulance folded away in the trunk of a doctor's car, ready at a minute's notice, is a novel, new device to be exhibited by A-B Stoves. Perfected for the war emergency, the Swift First-Aider ambulance unit has been hailed by medical men as the long-sought answer to quick, safe handling. See it demonstrated.

**A. S. ALOE COMPANY**  
Booths 16, 17, 18-H

A. S. Aloe Company cordially invites you to visit their display, which will include a complete line of American-made stainless steel surgical instruments, surgical supplies, laboratory apparatus, and physical therapy equipment. Many new and exclusive items of interest to the profession will be shown here.

**AMERICAN SAFETY RAZOR CORPORATION**  
Booth 8 P

For complete information on A. S. R. Surgeon's Blades visit the booth. Meet the company representatives, who can answer questions about these surgeon's blades. They will gladly explain the various uses of the blades—9 types in all.

**AMERICAN STERILIZER COMPANY**  
Booth 14-J

A display of typical modern office types of sterilizers will appear in this exhibit. Attendants will be on hand to welcome you and discuss the equipment with you.

**AUSTENAL LABORATORIES, INC.**  
Booth 11 O

A complete line of Vitallium appliances for internal fixation of fractures, arthroplasty, and replacement of bony and soft tissue will be displayed. Vitallium has been found to be the only alloy which is completely inert in vivo, does not irritate the tissues, and is unaffected by body fluids.

**C. R. BARD, INC.**  
Booth 5 S

C. R. Bard, since 1907 the leading importer of French catheters and bougies, will show the new line of American-made instruments. These will include not only rubber catheters and drains, but also for the first time the new Bard-User line of woven catheters and bougies, both urethral and ureteral. A visit to this display will demonstrate that American doctors are no longer dependent on foreign-made urological instruments.

**BARD-PARKER COMPANY, INC.**  
Booth 9 S

Bard-Parker will exhibit its new No. 9 knife handle, especially designed for general office use. Other products to be shown are Rib-Back surgical blades, long knife handles for deep surgery, renewable edge scissors, transfer forceps, hematological case for obtaining bedside blood samples, orthostat for obtaining accurate dental radiographs.

**BECTION DICKINSON & COMPANY**

Booths 11 and 12 Q

A display of syringes, needles, diagnostic instruments, Ace bandages, elastic adhesive bandage and thermometers will be presented. Doctors are invited to stop in and discuss methods of conserving the available supply of these items. Trained personnel will be in attendance for the convenience of visitors.

**CAMERON SURGICAL SPECIALTY COMPANY**

Booths 11 and 12 L

See the new Cameron Omniangle flexible Gastroscope, Binocular Prism Loupe, Color-Finish Clinical Camera, the Mirrolite and latest developments in electrically lighted diagnostic and operating instruments for all parts of the body. Of special interest are the new spark gap and tube electro-surgical units for cutting, coagulating, desiccation, and fulguration.

**WILMOT CASTLE COMPANY**

Booth 3 D

The war-busy physician today needs all the mechanical help he can get to make his tasks go easier and more quickly. Good sterilizing and lighting equipment is a material help in these circumstances. Modern aids in the way of new sterilizers and new lighting for the physician clinic, surgeon, and hospital will be shown.

**CLAY ADAMS COMPANY INC**

Booth 1 DD

The Clay-Adams Co. will show new orthopedic devices, the Herzmark-Adams traction reel, bone saw and drill, plastic splints, stone fistula obturator, Einhorn gastroduodenal tubes, Land-u-Adams micro-sedimentation apparatus, Crooprene (synthetic rubber) catheters, drains and tubes, obstetrical manikins, skeletons, anatomical charts, new first aid skeleton chart.

**CONTINENTAL SCALE CORPORATION**

Booth 6 R

Continental Scale Corporation will show a complete line of the latest models of personal weighing scales for home use, hospitals, schools, and physicians' offices.

**CRESCENT SURGICAL SALES CO**

Booth 1 R

In the complete setting of the "little operating room," visitors may watch the pretty nurse give the Master Blade Crescent to the surgeon. Every item—operating table, lights, instruments, nurses and nurses are made to accurate scale. It promises to be dramatic, interesting, instructive. Surgeons will also be interested in inspecting the new Plaster knife and the X-acto Pocket knife.

**DEVILBISS COMPANY**

Booth 13 K

A complete line of atomizers for the scientific treatment of nose and throat infections will be on display. The latest addition to the line is an all-glass atomizer having four outstanding features important in home application of nose and throat solutions. The Devilbiss representative will demonstrate this all-glass atomizer as well as many other instruments.

**J H EMERSON COMPANY**

Booth 11 H

J H Emerson Company will exhibit apparatus for artificial respiration.

**FOREGGER COMPANY INC**

Booth 8 T

Foregger Company will show new anesthesia apparatus, new developments in CO<sub>2</sub> absorbers including a twin canister model for indicator soda time, complete intratracheal equipment and oxygen therapy and resuscitation apparatus, and Alexander's mouth to mouth insufflator. Physicians are invited to stop in and hear representatives' explanations of any of the above equipment.

**GOMCO SURGICAL MFG CORPORATION**

Booth 15 R

The Gomco Corporation will exhibit their complete line of explosion-proof suction and ether pumps, their electric breast pumps, nose and throat treatment units, thermocirc drainage pumps, and centrifuges. The bloodless circumcision clamp will also be demonstrated.

**V MUELLER & COMPANY**

Booths 12 and 13 AA

Despite unprecedented demands of the war effort on the facilities of this company, a complete exhibit of modern American made instruments and surgical equipment will be shown. Among a number of new developments, the improved Herb Mueller anesthetics unit will be on display with a representative line of other fine Mueller equipment.

**OHIO CHEMICAL & MFG CO**

Booth 9 P

Among other well-known equipment, Ohio Chemical & Mfg Co. will exhibit two newly accepted resuscitators, the Heidbrink Resuscitator and the Heidbrink Adult Resuscitator, both Krebsman models. Physicians are invited to inspect this equipment.

**OXYGEN EQUIPMENT MFG COMPANY**

Booth 5 N

Manufacturers of the Barich-Thurston oxygen tents will show their O 1 M meter mask and their new positive pressure meter mask. These units are of great interest to hospitals, particularly at this time.

**PELTON & CRANE COMPANY**

Booth 1 S

The Pelton and Crane Company will display sterilizers, operating lights and cuspidors for physicians' offices and clinics. Featured will be the self-contained Pelton Automatic Autoclave, increasingly popular with industrial first aid clinics. The representative in charge will welcome your inquiries.

**GEORGE P. PILLING & SON COMPANY**

Booth 5 O

To see a number of important recent developments, physicians are invited to visit this exhibit. Important items to be shown include the Lemmon equipment for continuous spinal anesthesia, Tocantini needles for transfusion through the bone marrow, Miller-Abbott tubes for small intestine intubation, and Chevalier Jackson Bronchoscopic instruments.

**PROMETHEUS ELECTRIC CORPORATION**

Booth 17-J

The latest designs in emergency operating lights, sterilizing equipment and therapeutic lamps will be on display. The emergency lights should be of distinct value in assuring light for physicians during lacerations. Prometheus lighting engineers will be glad to go into various hospital problems with interested visitors.

**BITTER COMPANY INC**

Booths 5 and 6 I

This company will display its entire line of medical equipment, including the recently announced Model MB ear, nose and throat unit which has spray bottles, medicaments, the electrical and air appliances on one side and the vacuum, waste and water on its new surgical cuspidor on the other. Other products to be shown include motor chairs, bone surgery engine, sterilizers, compressors, fluorescent lights and stools.

**SAFETY GAS MACHINE CO., INC**

Booth 2 O

The latest approved anesthetic apparatus by this manufacturer will be displayed.

**EXHIBITORS**

played. The exhibit will be in charge of an experienced anesthetist who will be glad to discuss problems of this field with you.

**SCANLAN MORRIS COMPANY**

Booth 2 H

Representatives will demonstrate the safety and service features of explosion-proof Underwriters approved operating room lights and portable emergency battery-equipped surgical lights so essential in present-day hospital work. The new St. Mary's-Balfour general operating table is another outstanding item which will be available for inspection. Typical Scanlan sutures for specific surgery uses also will be demonstrated.

**SINGER SEWING MACHINE COMPANY**

Booth 6 Q and 13 P

The newly announced Surgical Stitching Instrument will be displayed by the Singer Company. Developed in close cooperation with the surgical profession, this instrument is the result of extensive research, and is constructed with the same craftsmanship that has marked Singer Sewing Machines for almost a century. Clinical trials have shown its success and practicability under difficult operating conditions. Doctors are cordially invited to see this new contribution to surgery.

**J SKLAR MANUFACTURING CO**

Booth 18 L

Visitors will find here a comprehensive exhibit of new suction and pressure apparatus, also a display of Sklar's American made stainless steel surgical instruments. Dr. Ernest P. Civo, orthopedic surgeon of San Antonio, Texas, will be present to discuss with interested surgeons the new Civo Orthopedic Instruments which are to be manufactured by the Sklar Company.

**C M SORESENSEN COMPANY**

Booth 4 R

Physicians are invited to discuss their problems of office equipment in connection with ear, nose and throat work. Many new models of suction and pressure apparatus will be on display for demonstration.

**UNION CARBIDE COMPANY**

Booth 15 N

On display are Linde Oxygen U S P, the Linde R-50 Oxygen Therapy Regulator, and the Linde L-14 Oxygen Therapy Station Flow-meter, also various types of small portable oxygen administering apparatus. Representatives will discuss the latest developments in oxygen therapy and provide information on the mechanical and management aspects of administering oxygen in the hospital or the home.

**VISCHER PRODUCTS COMPANY**

Booth 12 R

Two highly practical types of Flex-Seal Pressure Sterilizers will be offered in this exhibit. One—electrically operated, compact in size, rapid in action, equipped with automatic controls—is for office use. The other the Flex-Seal Midget is a small portable sterilizer which also provides pressure sterilization. It can be used on a gas hot plate or any other convenient source of heat.

**MAX WOCHER & SON COMPANY**

Booth 12 O

This 105-year-old house will display hundreds of its finest surgical instruments and a complete line of supplies. Physicians will be cordially welcomed and demonstrations given.

**ZIMMER MANUFACTURING COMPANY**  
Booth 4-M

A very complete line of fracture equipment will be exhibited by this manufacturer. Among the new items on display will be the improved screw driver, the east enter rib splint, Red Cross type of Thomas iron and leg splints, Canine's wire twisted screw and plate container, bone plate holders and the improved Inletto-chantelle bone plate.

**DIAGNOSTIC EQUIPMENT****AMERICAN OPTICAL COMPANY**  
Booths 4, 5, 6 7 K

Scientific eye-diagnostic instruments and equipment will be exhibited by American Optical Company. In addition Spencer Lens Company, scientific instrument division of AO, will show microscopes and other instruments used by doctors.

**W A BAUM COMPANY, INC**  
Booth 4 Q

This exhibit will be devoted exclusively blood pressure apparatus as have the efforts of the manufacturer for more than twenty-five years. The new Standby, a practical floor model will be featured and visitors may also view all other models plus a complete line of genuine latex replacement parts.

**BECK-LEE CORPORATION**  
Booth 14 N

Due to the unusual burdens placed upon every practice under today's conditions, physicians are expected to be especially interested in the exhibit of the Beck-Lee Quartz-Shling Electrocardiographs. This equipment designed by Charles L. Huddle, incorporates all those principles necessary for accurate dependable electrocardiography.

**WARREN E COLLINS INC**  
Booth 16 Q

The latest Drinker-Collins Duplex respirator which treats two children in the same machine will be shown here. The new streamlined combination infant respirator and incubator will also be of interest. Latest models of both the Benedict-Bell metabolism apparatus and Lottus Oxflow oxygen tent will also be on display. Physicians are invited to see demonstrations of this equipment.

**GASTRO PHOTOLABORATORIES**  
Booth 5 R

This display will be of interest to physicians interested in complete and accurate diagnosis of gastric pathology. The new automatic stomach camera for color photography, a recent development in modern diagnostic equipment will be exhibited, together with a large number of normal and pathological gastrophotographs in natural color and black and white.

**JONES METABOLISM EQUIPMENT COMPANY**  
Booth 7 I

A visit here will reveal new and original devices added to the Jones Motor-Basal metabolism unit to insure accuracy of the basal metabolism test. Physicians are invited to call and have representatives explain these distinctive features.

**KEYSTONE VIEW COMPANY**  
Booth 10 L

The ever increasing interest in visual screening tests and in the rehabilitation of men who fail to pass the visual tests for entrance into Army and Navy will make a visit to this booth of unusual importance. Widely used screening tests and conservative orthoptic procedures will be featured.

**LAMOTTE CHEMICAL PRODUCTS COMPANY**  
Booth 17 L

This exhibit will include some of the latest developments of the Lamotte research department, among them the office model of the Lamotte Falling Drop Densitometer, the new Lamotte sulfonamide outfit, the new Lamotte unit for vitamin C determinations, and others. Information on the operation of these units will be given to visiting physicians.

**SANBORN COMPANY**  
Booth 16 P

At the Sanborn Company booth visitors will find a display of cardiac diagnostic apparatus for both clinical and research use. Clinical needs are provided for in the Cardiette for electrocardiography alone, the Stetho-Cardiette, also for phonocardiography, the Cardioscope for visual cardiac recording, and the 1912 Waterless for modern metabolism testing. Designed primarily for research is the new 11-Beam Stetho-Cardiette which combines electrocardiography, phonocardiography and electrical auscultation.

**SPENCER LENS COMPANY**  
Booth 7 K

See American Optical Company

**TAYLOR INSTRUMENT COMPANIES**  
Booth 13 M

Physicians are invited to stop at the Taylor booth and see the new Tycoos Hook-Type cuff, which saves time and increases accuracy. Made from reinforced army cloth and metal ribs, it gives uniform compression over the entire width of the cuff—and many veins of navel service. Visitors here may see the Tycoos Aneroid Sphygmomanometer, and the "Lag Error" demonstration.

**U M A INC**  
Booth 11 R

A complete line of vascular equipment will be exhibited. Visitors can see and use the Collins Sphygmo-Oscillometer, a blood pressure machine and oscillometer combined, recognized as an important diagnostic aid in vascular disease. Continued demonstrations will be given with the Collwell Intermittent Venous Occlusion Apparatus and the U M A Thermocouple.

**DIETETIC PRODUCTS****AMERICAN INSTITUTE OF BAKING**  
Booth 4 U

Facts about Enriched Bread (enriched with vitamins and minerals), of direct significance to every physician, will be available at this exhibit. Enriched Bread complies with the almost universal preference for a white loaf, yet approximates the

nutritive values of whole wheat. Its use is encouraged by the A M A Council on Foods and Nutrition, and other medical and scientific authorities.

**AMERICAN SEAL KAP CORPORATION**  
Booth 12 H

You are invited to stop here for a cool drink of Enviae Milk. This fresh milk of low acid tension, fine flavor and easy digestibility will be served throughout the convention. Reprints from the literature covering over five years of laboratory and clinical experience in this field will be mailed upon request of visiting physicians.

**BEECH NUT PACKING COMPANY**  
Booth 6 M

Twenty-two different foods for babies will be the Beech-Nut Packing Company's exhibit. These will include their Strained Foods and Chopped Foods, packed in glass jars with reseal covers which make the glass jars ideal for refrigerator storage. A new product which will probably interest physicians is strained squash, a good beginning vegetable, used in the diet much as are carrots.

**BEST FOODS, INC**  
Booth 14-K

The manufacture of Nueor, the modern vegetable margarine, will be dramatized. The display will feature the testing carried on to maintain the uniform quality of Nueor and its consistent vitamin A potency of 9,000 USP units per pound. Highlighted also will be the fine flavor and texture of Nueor and the increasingly important place of fortified margarine in the national nutrition program.

**BIRDS EYE FOODS (GENERAL FOODS)**  
Booth 18 N

This exhibit will feature the nutritional angle of Birds Eye Foods, their excellent food value, ease of preparation, freedom from waste and appetite appeal.

**BORDEN COMPANY**  
Booths 1, 2 and 3 Lobby

A cordial reception awaits physicians and their friends here. The complete display of Borden's scientifically designed Council accepted infant foods includes such new products as Biolac, New Improved Drisco, and Mull-Soy. As in the past, a wide variety of Borden's delicious cheeses will be served every afternoon at the Borden Cheese Bar adjacent to the professional exhibit.

**CARNATION COMPANY**  
Booth 3 V

In this exhibit you may see a complete and dramatic presentation of the story of Irradiated Carnation Milk. Every operation in the processing—from farm to finished product—will be performed in miniature before the eyes of visitors. You are invited to enjoy this personally conducted tour through a Carnation expounding plant.

**CEROPHYL LABORATORIES, INC**  
Booth 8 N

Cerophyl Laboratories will have on display photographic records of timely and interesting vitamin experiments. Now that the nation's attention is centered on proper nutrition and corrective diets, you will not want to miss this exhibit. A cordial invitation is extended to visit here.

**CORN PRODUCTS REFINING COMPANY**  
Booth 6 Lobby

Increasing recognition of Mavola Corn Oil as a rich source of linoleic acid has inspired many requests from physicians for information on the use of Mavola in palatable high-fat diets. The helpful booklet which has been prepared shows the chemical composition of Mavola, a qualitative analysis, specific disturbances in which Mavola has proved clinically effective, and a dietary regime with actual recipes. Ask for your copy of this booklet.

**DIETENE COMPANY**  
Booth 11 K

Physicians are invited to become acquainted with two new products in this exhibit: Dietene's Supplement for use in reduction diets and Dietene's Accessory Feeding, a high protein, high vitamin, high mineral complement, for use in other restricted diets. They may furnish the answer to many feeding problems.

**FLORIDA CITRUS COMMISSION**  
Booth 10 R

Visiting members are cordially invited to stop here for a generous sampling of orange or grapefruit juice. These juices are made from Sunfilled Pure Concentrated Citrus Juices. While visiting the exhibit you may hear a little of the history and development of these interesting products and the part they are playing in our war effort.

**GENERAL MILLS INC**  
Booth 15 P

Make a "must see" stop on your Convention tour at the Better Nutrition exhibit sponsored by the special commodities and grocery products divisions of General Mills. Featured here will be Gold Medal Kitchen Tested Enriched Flour Bisquick Wheaties Cheerios and six all nutritionally improved products and folic acid and Vitamin D. The latter two representing the special commodities division.

**GERBER PRODUCTS COMPANY**  
Booth 16 L

Tables showing vitamin mineral and other nutritive values of the thirty Gerber Foods will be conveniently arranged for ready reference by visiting physicians on Gerber's Professional Filing Cards. Inspection of the complete line of foods and up-to-date literature is invited.

**CHRIS HANSEN'S LABORATORIES INC**  
Booth 16 N

The "Junket Folks" will present enlarged photos showing the action of the rennet enzyme in forming softer finer milk curds, also a display of "Junket" brand food products. Literature describing dietary uses of rennet-curdled in infant child convalescent or postoperative feeding will be available and a well informed attendant will be on duty at all times.

**HAWAIIAN PINEAPPLE COMPANY LTD**  
Booth 10 J

Despite troubled conditions in the Pacific Dole Pineapple Juice from Hawaii will appear again at this year's convention. You will find this refreshing beverage at the Dole booth along with new information as to availability, nutritional benefits and other data concerning all Dole pineapple products.

**H. J. HEINZ COMPANY**  
Booths 2 and 3 S

The Heinz exhibit featuring Strained and Junior Foods will merit your thoughtful attention if you prescribe for infant feeding or adults on soft diets. While you are visiting the exhibit, be sure to register for the tenth edition of the popular Nutritional Charts and Nutritional Observations—a quarterly journal edited by the staff of the Heinz Nutritional Research Division in the Mellon Institute.

**IRRADIATED EVAPORATED MILK INSTITUTE**  
Booth 9 N

You are cordially invited to register for a free copy of our new manual for physicians Infant Feeding with Irradiated Evaporated Milk. Included in this comprehensive booklet are discussions of the feeding of newborns complementary feeding supplementary foods and other phases of the dietary management of infants. Other material on the uses of evaporated milk in the dietary is available.

**LIBBY McNEIL & LIBBY**  
Booth 2 V

Libby's Homogenized Baby Foods and Evaporated Milk will be featured. Spectators will see the story of these products in a slide film while they listen in on an interesting dialogue which can be heard only over telephones installed at the booth. Advantages of the exclusive Libby process of preparing baby foods will be described.

**M & R DIETETIC LABORATORIES**  
Booth 8 t

Physicians are cordially invited to visit this booth where competent representatives will be pleased to discuss the merits of Similac a food for infants deprived of breast milk and to suggest its application for both the normal and special feeding case.

**MEAD JOHNSON & COMPANY**  
Booths 9 10 DD 8 K 1 2 AA

The war has not yet seriously affected the normal production of Mead Johnson products. The display this year will include Nutramigen known during its experimental stage as Amigen Compound. This product offers a new approach to the dietetic control of allergy.

**MELLIN'S FOOD COMPANY**  
Booth 3 L

That you may be fully informed regarding the wide usefulness of Mellin's Food you are invited to meet our representatives at the convention. They will present for your consideration details of the composition of Mellin's Food and its application in preparing nourishment for infants, children and adults.

**NATIONAL LIVE STOCK AND MEAT BOARD**  
Booth 7 V

This exhibit will portray the role of meat as a source of protein calories minerals and vitamins in the adequate diet. Literature showing the food value of meat and the place of meat in the national nutrition program will be available.

**NESTLE'S MILK PRODUCTS**  
Booth 10 O

Nestle's will feature Lactogen which has behind it the firm's experience of more than three-quarters of a century in the manufacture of baby foods and other milk products. Representatives will be glad to discuss Lactogen with physicians interested in infant feeding.

**PENICK & FORD LTD INC**  
Booth 4 N

The makers of Brer Rabbit Molasses invite your consideration of new findings on this rich and inexpensive source of iron. Results of research will be on exhibit at the booth. Significant is the conclusive demonstration of high availability (over 80%) of molasses-iron, which establishes New Orleans Molasses as second only to beef liver as a food source of absorbable iron.

**PET MILK COMPANY**  
Booths 6 and 7 U

An actual miniature working model of a milk condensing plant will be exhibited. This display will offer an opportunity to obtain information about the production of Irradiated Pet Milk and its uses in infant feeding and general dietary practice. Miniature Pet Milk cans will be given to each physician who visits the booth.

**POSTUM (GENERAL FOODS)**  
Booth 18 N

Visitors are invited to have a refreshing drink of Iced Postum at the booth. This wholesome cereal beverage is made from whole wheat and bran roasted and slightly sweetened. It is available in two forms—Postum Cereal made like coffee and Instant Postum made instantly in the cup or pot. Postum-made-with-milk is an easy way to keep milk interesting whether served iced or hot.

**S M A CORPORATION**  
Booths 7 and 8 O

New and rare nutritional biochemicals will be on display at the S M A booth. Wax mouldages demonstrating nutritional deficiencies in humans and experimental

animals exhibiting various deficiency diseases will be of interest. Trained members of the field and research staff will be in attendance.

**SANKA (GENERAL FOODS)**  
Booth 12 N

A cup of delicious Sanka Coffee will be served to visitors at the booth. This choice blend of Central and South American coffees has 97% of the caffeine removed.

**SCIENTIFIC SUGARS COMPANY**  
Booth 15 O

Scientific Sugars Company will have on display Carlose Hides and the Kinex line of nutritional products. Competent representatives will be on hand to give any possible help to physicians, who are cordially invited to stop.

**STANDARD BRANDS INCORPORATED**  
Booth 4 K

Enriched White Bread and the part it is playing in the drive for better nutrition will highlight the Standard Brands exhibit. Attending physicians will have an opportunity to discuss with nutrition authorities the part played by proper food in the war effort. Visitors are urged to see the motion picture "The Modest Miracle" which will be shown by the Medical Film Guild. Booth 11-AA Technical Exhibition Hall.

**SUN RAYO COMPANY**  
Booth 16 J

Doctors are invited to stop for a refreshing drink of Kemp's Sun-Rayed Tomato Juice. This juice is made from prize-winning tomatoes of the 1911 Indiana tomato champion and runner-up champion and crops of hundreds of other Kemp growers who won gold and silver medals for their high quality tomatoes.

**UNITED FRUIT COMPANY**  
Booth 1 H

The latest authentic information on the nutritive and therapeutic values of the banana will be available at this exhibit. The display will present some of the important clinical and nutritional studies which have been undertaken the past few years and reports of these which have recently been published.

**VEGEX CORPORATION**  
Booth 3 P

The makers of Vegex vegetable extract invite physicians to call at their exhibit and make the acquaintance of their product. Derived from fresh brewers yeast and vegetables the American Vegex has been improved especially in flavor.

**HEARING AIDS**

**AUREX CORPORATION**  
Booth 6 T

Visitors are invited to inspect the Aurex Hearing Aid display. The newest Aurex Model C Vacuum Tube Hearing Aid is said to be worthy of careful investigation. The regular air conduction receiver and the new Aurex crystal bone conduction receiver will also be shown. The Aurex method of fitting hearing aids to individuals' hearing needs will be explained in detail to visitors.

**DICTOGRAPH SALES CORPORATION**  
Booth 5-U

Acousticon will exhibit a practical answer to the National Health Survey's finding of 9,000 deaf persons. From the official conclusions, Acousticon engineers have perfected a new and advanced instrument the radio-amplified Symphonic Acousticon, the performance of which will be demonstrated at this convention booth.

**MAICO COMPANY, INC**  
Booth 3 U

Precision hearing instruments will be demonstrated against the background of the Maleson-ton-color organ on which visitors can check their own hearing acuity and study the operation of the Maico audiometer. This audiometer is used for hearing tests by the Army Navy civil aviation and many physicians. Attractive souvenirs will be presented to visiting physicians and their wives.

**OTARION, INC**  
Booth 2 K

Otarion Incorporated has prepared an attractive portfolio of facts on its vacuum hearing aid. This material should be of special interest to physicians having otological cases in which physical therapy is indicated. The same data is available to physicians not attending the Convention. Requests may be addressed to Otarion, Inc. 445 North Wells St. Chicago, Illinois.

**MEDICAL BOOKS****D APPLETON CENTURY COMPANY**  
INC

Booth 2 AA

Here the Appleton-Century representatives are featuring important new books on First Aid, Child Psychiatry, Psychologic Care During Infancy and Childhood, Symptom Diagnosis, Practice of Medicine and Operative Surgery. These and other recent revisions of standard titles may be examined at leisure. Also available will be advance data on the new Clinical Diagnosis by Laboratory Methods by John Kolmer and Frank Konzeimann.

**BLAKISTON COMPANY**  
Booth 5 J

This company will exhibit its complete line of medical books among them the new sixteenth edition of Hughes' Practice of Medicine, a favorite of general practitioners, the new Sixth Diagnosis, Prevention and Treatment of Tropical Diseases, sixth edition rewritten by Strong, the new Functional Neuroanatomy by King and the new tenth edition of Morris' Human Anatomy, Gould Medical Dictionary, fifth edition.

**COLWELL PUBLISHING COMPANY**  
Booth 17 N

The firm will present the Daily Log for Physicians, fifteenth edition of a book-keeping system which provides a display of important income and expense items, all in loose leaf form, well bound. Figures that are essential for income tax returns, budgets, and legal aid are simply systematized. Easily maintained and complete, the Log is edited annually, keeping it abreast of all possible improvements.

**F A DAVIS COMPANY**  
Booth 15 M

Here the teacher, the specialist, the general practitioner, the intern and medical student will find many new and interesting books, including Digestive Diseases in General Practice, Willard, Therapeutics of Infancy and Childhood, Hethcote and Demba, Vaginal Hysterectomy, Kennedy-Campbell, Medical Diagnosis, Loewenberg, Tan, Nose and Throat, Federer, Internal Diseases of the Eye, Francoso, Cardiovascular Disease, Straud, and the book of the day—The Development of Medicine, Surgery and Specialties.

**PAUL B HOEBER, INC**  
Booth 14 I

An invitation is extended to look over the new Haeber books, including Preventive Medicine in Modern Practice and Dressler's Clinical Cardiology and such recent books as Alvarez, Gastro-Intestology, Hertzler's Thyroid Gland, Ferguson's Roentgen Diagnosis of the Extremities and Spine, Nielsen's Neurology, and those by Pardee and Eisberg. Find out about Berliner's forthcoming Blomicroscopy of the Living Eye.

**LEA & FEBIGER**  
Booth 14 H

Among their new works Lea and Febiger will exhibit Wintrobe's Clinical Hematology, Craig's Manual on Protozoan Diseases, Katz' Electrocardiography and Exercises in Electrocardiographic Interpretation, Howes' Illumination Diets and Krimes' Therapy of the Neuroses and Psychoses. New editions will be shown of Kovacs' Electrotherapy and Light Therapy, Werner's Endocrinology, Gifford's Ocular Therapeutics, Bridges' Diets for the Child, Connors on Arthritis, Kuntz' Neuro-Anatomy, Lewin on The Foot and Ankle and Kessler's Accidental Injuries. Specimens of forthcoming publications will also be on exhibition.

**J B LIPPINCOTT COMPANY**  
Booths 4 and 5 Lobby

A number of new Lippincott books of interest to physicians will be on display. Visitors are invited to stop and browse through the numerous titles in this exhibit.

**MACMILLAN COMPANY**  
Booth 9 I

Interest at the Macmillan booth this year will center on the much discussed Disease and Injuries of the Larynx, by the Dr. Jackson. Other books of special interest will be Physical Chemistry for Students of Biochemistry and Medicine, by West, with its reference and review text for workers in biology and medicine, Webster's Rabies, Modern Bread from the Viewpoint of Nutrition by Sheiman and Peterson.

**C V MOSBY COMPANY**  
Booth 1-T

New publications and new editions to be displayed will include Kilduffe-DeBakey, The Blood Bank, Ken-Conwell, Fractures, Dislocations and Sprains, Tassman, Eye Manifestations of Internal Diseases, Porter-Carter, Management of the Sick Infant and Child, and Davison, Synopsis of Materia Medica, Toxicology and Pharmacology. An invitation is extended to visit this booth and examine these and other recent titles.

**OXFORD UNIVERSITY PRESS**  
Booth 15 J

On display in this booth will be many works of interest to physicians. Among them are new titles such as Blood Disorders in Children by Dr. Kugelmass, Workmen's Compensation and the Physician by Dr. Jordan, Gynecological Operations by Dr. Cameron, Text-Book of the Practice of Medicine edited by Dr. F. W. Pilee, and Oxford Medical Outline Series.

**W F PRIOR COMPANY, INC**  
Booth 13 J

Four practical solutions to the problem of keeping up to date will be offered for the examination of physicians. They are four loose-leaf reference books published by Prior, and periodically brought up-to-date on all proven clinical changes. Visitors are invited to see the current forms of Tlee's Medicine, Lewis' Surgery, Brennen's Pediatrics and Davis' Gynecology and Obstetrics.

**W B SAUNDERS COMPANY**  
Booths 15 and 16 H

An unusually attractive exhibit of many new books and new editions will include the six Official Military Surgical Manuals, the new 1912 Mayo Clinic Volume, Lundy's Anesthesia, Walters, Gray and Priestley's Canceroma of the Stomach, Dunbar's Metabolic Diseases, Johnstone's Occupational Diseases, Surgical Practice of the Larynx, Clinie, Kolmer and Tuft's Clinical Immunology, Brotherton and Chemotherapy, Cutler's Diseases of the Hand, Weiss and English Psychosomatic Medicine, Wharton's Gynecology.

**SURGICAL PUBLISHING COMPANY**  
Booth 17 R

Convention visitors interested in surgical literature will enjoy the exhibit of Surgery, Gynecology and Obstetrics. Pages of this journal will be reproduced with special lighting to illuminate contents and bring out the fine typography and beautiful illustrations. An attendant will be present to point out unusual features of the journal, including the International Abstract of Surgery.

**CHARLES C THOMAS PUBLISHER**  
Booth 12 J

New titles available for inspection at the Convention will include Syphilis by Moore, Intestinal Obstructions by Wangersteen, Blood Substitutes by Mudd and Thallmer, Burns by Harkins, Sterility by Hamblen, Wounds and Fractures by Orr, Skin Grafting by Padgett, Parasitology by Pearce, Nutrition by Maey, Epilepsy by Penfield and Erickson, Occupational Diseases by Reed and Hareourt, Surgical Physiology by Nash, and many others.

**UNIVERSITY OF CHICAGO PRESS**  
Booth 1-R

Recent medical publications of the following University Presses are on exhibit in this booth: Yale, Minnesota, Harvard, Chicago, Columbia, Stanford, Princeton, Pennsylvania, Wisconsin, Duke, and Iowa State College. Convention visitors are invited to examine important journals, reports of research and general publications in the field, on display here.

**WILLIAMS & WILKINS COMPANY**  
Booth 9 V

Williams and Wilkins and William Wood books will include many suitable for military and civilian practitioners under war conditions. Titles: Surgery of Modern Warfare, Hurst, Medical Diseases of War, Fletcher, War Wounds and Injuries, Orkes, Bandaging and First Aid, Armstrong, Aviation Medicine, Bidgood, Urology in War, Brittain, Arthrodesis, Robotham, Acute Injuries of Head, Ross, War Neuroses, and others.

**YEAR BOOK PUBLISHERS, INC**  
Booth 8 J

Kelly and Dowell's Roentgen Treatment of Infections, Bons' Treatment of the Patient Past Fifty, Schnauffer's Pediatric Gynecology, and a completely revised second edition of Sulzberger and Wolf's Dermatologic Therapy in General Practice are recent titles to be exhibited by the Year Book Publishers. Spink's Sulfanilamide Book, Publishers' Spink's Sulfanilamide and Related Compounds in General Practice, Gordon and Seyringhaus' Vitamin Therapy in General Practice, and other

manuals together with the Year Books will complete a varied display which visiting physicians are invited to inspect

## OFFICE FURNITURE

W D ALLISON COMPANY  
Booth 3 N

Manufacturers since 1881 of physicians fine examining room equipment this firm will again show a comprehensive line at the Convention. Come in and see the many special features incorporated for your convenience. Allison factory representatives will be glad to discuss the entire line with you.

MCCASKEY REGISTER COMPANY  
Booth 1 M

With many physicians in the armed forces, intensive demands of practice at home are being aided by the visible and accessible records possible in McCaskey One Writing Systems. Instantly available active patient unpaid account and case history records will be shown in the McCaskey booth. How to meet collection needs under present emergency conditions will be demonstrated.

SHAMPAINE COMPANY  
Booth 7 S

This exhibit will present the new de luxe model Steeles Examining Table the Martin All-Purpose Examining and Rectal Table the new hydraulic nose and throat chair-table, and other equipment for use in the physician's examination room.

## PHARMACEUTICALS

ABBOTT LABORATORIES  
Booth 2 T

An extensive line of Council accepted anesthetics antiseptics chemotherapeutic agents hypnotics and vitamin products including several new research items will be exhibited. A staff of well-informed specialists will be on hand to answer inquiries. Your visit will be most welcome.

ALBA PHARMACEUTICAL CO INC  
Booth 10 K

The keystone of the Alba Pharmaceutical Company's exhibit is medical defense. Such well known products as Creamarin and Sulfathiazole Alba will be shown. Present investigations are centered around such war needs as anti-malarials analgesics, hypnotics. Clinical samples and literature will be available to all physicians.

AMERICAN HOSPITAL SUPPLY CORPORATION  
Booth 8 U

Visitors to this exhibit will see interesting demonstrations of the ease, rapidity and economy of plasma preparation with Baxter equipment by both centrifugation and sedimentation methods. You will also have an opportunity to discuss the latest transfusion methods.

ARLINGTON CHEMICAL COMPANY  
Booth 1 L

The growing interest in allergy and recent figures indicating that a surprising percentage of our population is allergic in some degree, promise considerable interest in this exhibit. The Arlington Chemical Company will show their pollen and protein extracts for cutaneous and intradermal testing, also for hypersensitization.

ARMOUR LABORATORIES  
Booths 19 20 21 H

A cordial invitation is extended to physicians to visit the Armour chemical display depicting cases of thyroid deficiencies by means of wax models. Physicians interested in endocrinology will find this very informative. Presented also will be a graphic exhibit showing how the extrinsic factor combined with the intrinsic factor produces the hemopoietic principle stored in the liver.

BILHUBER KNOLL CORPORATION  
Booth 16 M

Increased production is meeting the wartime needs of the civilian population the Army Navy and other governmental

agencies for such important drugs as Metrizol Theoclole and Dilauid hydrochloride. For up to the minute information on these drugs stop by for a visit at the Bilhuber-Knoll booth.

GEORGE A BREON & COMPANY  
Booth 11 I

An exhibit of newer Council accepted preparations has been arranged for you. Well informed representatives will be on hand prepared to answer questions of physicians interested in these Breon products.

BURROUGHS WELLCOME & COMPANY  
Booth 6 V

An institutional exhibit outlining the firm's scientific research and technical activities in the fields of pharmacy chemistry and medicine will be prepared for visitors to the Burroughs-Wellcome booth.

CHURCH & DWIGHT CO INC  
Booth 14 S

Church & Dwight will exhibit Arm & Hammer Bicarbonate of Soda. Three years before the first meeting of the American Medical Association this company pioneered in producing bicarbonate of soda in the Western Hemisphere. This year besides exhibiting various uses of this product in medical practice the attendants will demonstrate its value as a powder for cleaning the teeth.

CIBA PHARMACEUTICAL PRODUCTS  
Booth 13 I

Physicians are cordially invited to see the Council accepted specialties displayed here. These will include Diol Digifolin Isrol Nupercaline and Viormin. Three representatives and an executive of the firm will be in attendance and will gladly discuss Ciba specialties.

CUTTER LABORATORIES  
Booth 15 I

Be sure to visit this exhibit and see a demonstration of the Cutter technique for preparing blood plasma. In the hospital a complete line of the Cutter intravenous solutions will also be displayed.

DAVIES ROSE & COMPANY LTD  
Booth 1 O

Representatives will be on hand to welcome doctors who visit the booth. They will explain to visitors how the company's resources place them in a position to continue unrestricted to meet the demands for their products and to assure physicians of undiminished dependability and uninterrupted uniformity.

DENVER CHEMICAL MANUFACTURING COMPANY  
Booth 10 L

Galatest the dry reagent for the instantaneous detection of diabetic sugar, will be demonstrated. Physicians will surely find this demonstration very interesting. Basically Galatest is a modification of Alexander's reagent. It is a distinct advance over liquid tests on account of its speed simplicity and economy and the fact that diabetic patients are easily taught to make the test.

DRUG PRODUCTS COMPANY INC  
Booth 2 I

Council accepted Pulvoids and Hyposols will be exhibited. These include Pulvoids Digallols Colium which are standardized by both the Hatcher-Brady Cat Method and U S P XI Trog Method. Pulvoids Sulfanilamide 5 grains Hyposols Liver Solution Purified U S P and Solution of Ethylamine Hydrochloride Crystals. Representatives will be glad to discuss pulvoids with visitors.

THOMAS A EDISON INC  
Booth 9 R

A non-caustic carbon dioxide absorbent is now available for use with rebreathing devices such as anesthesia machines oxygen therapy and basal metabolism tests. Baralyme is not only more efficient but presents no hazard of caustic burns to the face or mucous membranes of the respiratory passages. In constant widespread clinical use for almost two years Baralyme is being exhibited for the first time at a national medical convention.

ENDO PRODUCTS INC  
Booth 9 AA

Convention visitors who look behind the finished product will find the manufacture of ampul drugs by today's methods of great interest. Skilled technicians of the Endo Laboratories will demonstrate the filling and sealing of several official and N N R preparations with the latest automatic filling and sealing apparatus. The numerous Endo preparations listed in N N R will be on exhibit. Trained representatives will be on hand and souvenirs will be available.

FLINT EATON AND COMPANY  
Booth 5 DD

An entirely new display featuring a murkin which shows the importance of certain elements in the human body, will be the center of attraction here. Specially trained men will be on hand to discuss calcium therapy with visitors. Calcium-Gluconate-Effervescent and several other important products will be on display.

GANES CHEMICAL WORKS INC  
Booth 9 R

Two successes of chemical science will be featured at the Gane booth. Nicotinamide N N R and Pentothartrial Sodium N N R. Both substances are playing a significant role in modern therapeutics. Competent representatives will be in attendance to discuss the many uses of these products.

GILLILAND LABORATORIES INC  
Booth 1-P

At this booth will be exhibited the antitoxins sera and vaccines which this firm produces exclusively. Since its founding in 1882 the firm has specialized in biologics for the medical profession. You are cordially invited to visit this exhibit and become acquainted with their newer products.

HOFFMANN LA ROCHE INC  
Booth 6 J

You are invited to make the Roche booth your headquarters during the Convention. Members of the medical and field staffs will be available to discuss the many new interesting developments on Prostigmin Syntropin and other Roche preparations.

**HOLLISTER-STIER LABORATORIES**

Booth 3-J

Physicians are cordially invited to call and acquaint themselves with this firm's personalized allergy service of nation-wide scope. Information will be available on the various Hollister-Stier allergenic products, all of which are Council accepted.

**HOSPITAL LIQUIDS, INC.**

Booth 1-P

The Liltah Compilizer using cellulose tubing was introduced to the medical profession at last year's convention, and scored an instant success. Liltah representatives will be glad to demonstrate its simplicity and added safety. In addition a convenient and economical method whereby every hospital can dry plasma from the frozen state will be demonstrated.

**HYNSON WESTCOTT & DUNNING**

Booth 7-J

Mercurochrome and other pharmaceutical specialties of this manufacturer will be exhibited. There will also be a display of diagnostic apparatus and impale solutions which have been developed in the firm's laboratories in cooperation with physicians. Competent representatives will be in attendance to demonstrate these products, and literature and samples will be available to physicians.

**INTERNATIONAL VITAMIN SALES CORP.**

Booth 2-N

This House of Vitamins will feature a complete line of their Council accepted vitamin preparations. Physicians visiting the booth will find recent developments in vitamin advances of particular interest. The director of research and members of the staff will be present for consultation.

**LAKE SIDE LABORATORIES**

Booth 8-DD

The growing list of Lakeside medications accepted by the Council on Pharmacy and Chemistry attests to the emphasis placed upon high standards in research and control. Members of the scientific staff in attendance at this exhibit will be glad to discuss the pharmacological and chemical aspects of their work.

**LEDERLE LABORATORIES, INC.**

Booths 10 and 11-S

Sulfadiazine will be the focal point of attention in Lederle's exhibit. Animated charts will dramatize speed of recovery and other advantages under the Sulfadiazine therapy in pneumonia. In section 1 of the exhibit liver therapy in pernicious anemia will be illustrated. In section 2, an animated chart will show the most common causes of low fever in the six zones of the United States.

**ELI LILLY & COMPANY**

Booths 3 and 4-T

Eli Lilly and Company again will present a scientific demonstration. Due to the war, typhus has come into greater prominence and the typhus agglutination test to be demonstrated will be of particular interest to physicians. An agglutination test which indicates protection against pellagra also will be shown. The entire display is new and of interesting design.

**McKESSON AND ROBBINS, INC.**

Booth 3-W

Two distinct features will comprise this exhibit: a display of Council accepted vitamin products, and a laboratory demonstration showing the methods of instrumental and biological assay of the various vitamin concentrates and mixtures. The technical part of this display in particular should prove extremely interesting to the physician.

**McNEIL LABORATORIES, INC.**

Booth 12-I

With a specially designed exhibit this year, McNeil Laboratories will show some of their Council accepted products. Of particular interest will be the illuminated phototaphis tracing Digitalis Duo-test "from plant to patient." Trained members of the staff will be present to discuss with physicians the preparation of this product and other specialties.

**MALLINGKRODT CHEMICAL WORKS**

Booth 10-N

Members of the medical profession and their friends are invited to visit the Mallinkrodt exhibit where those USP and NF preparations most frequently used and prescribed by the physician will be displayed. Certain specialty products will also be shown. The attendants in charge will be glad to be of service in answering questions regarding these items.

**MALTINE COMPANY**

Booth 16-I

An up-to-the-minute display featuring time-honored Maltine with Cod Liver Oil will be offered here. This product is the result of sixty-seven years' continuous research and experience, embodying latest scientific developments.

**MERCK & COMPANY**

Booths 18, 19, 20-K

A prominent display of drugs and chemicals will be found at the Merck exhibit. Highlights will be the sulfonamides and zinc peroxide-spectral medicaments for the treatment of infected wounds, Viochrome, inhalation anesthetic for short surgical procedures, the vitamins, useful drugs, and Methylol Chloride, an effective parasympathetic stimulant. A special feature will be a mechanized model reproducing the Merck research laboratories in authentic detail.

**WM. S. MERRELL COMPANY**

Booth 9-J

The Merrell exhibit will show a wide range of Council accepted products, with emphasis on the fields of vitamin therapy, chemotherapeutics, and local anesthesia. Featured will be Dioxine Hydrochloride, a Merrell local anesthetic of profound and unusually long-continued action. All physicians are invited to stop by the Merrell booth for a visit with representatives of "Pioneer American Pharmaceutical House."

**NATIONAL DRUG COMPANY**

Booth 18-M

Biological products for the prophylaxis and treatment of injuries in industrial accidents, and for protecting preschool and school children against preventable diseases of childhood will be featured at this exhibit, together with a comprehensive line of biochemical pharmaceutical products.

**PARKE, DAVIS & COMPANY**

Booths 2 and 3-DD

Featured in the Parke-Davis exhibit will be the sex hormones, Theelin and Theelol, antispasmodic agents, such as Mapharsen and Thio-Bismol, posterior lobe preparations, including Pituitrin, Pitocin and Pitressin, and various adrenalin chloride preparations.

**PETROGALAR LABORATORIES**

Booth 13-N

A new and enlightening story on Petrogalin, an aqueous suspension of mineral oil, will be related at the Convention. Beautifully colored anatomical drawings and new literature may be had from our professional representatives. Physicians are cordially invited to visit the exhibit.

**RARE CHEMICALS, INC.**

Booth 13-H

This exhibit will feature Gitalin Amorphous, a rapid, dependable glucoside fraction of digitalis purpurea, Salysal, Rare Chemicals, the salicylic ester of salicylic acid designed to provide improved salicylate therapy by reducing local gastric irritation to a minimum, and Optochin Hydrochloride, Rare Chemicals brand of ethylhydrocupreine hydrochloride, for pneumococcal infections of the eye.

**RIEDEL de HAEN, INC.**

Booth 3-K

Physicians who visit the Riedel-de Haen booth will be welcomed by representatives well posted on the latest developments of bile acid therapy, and ready to discuss specific problems. You are invited to register for your copies of informative literature on the use of this manufacturer's chemical pure bile acids.

**SANDOZ CHEMICAL WORKS, INC.**

Booth 15-Q

Sandoz products on display will include Gynogen, ergotamine tartrate, the pure principal alkaloid of ergot used as a specific for migraine and as a hemostatic in obstetrics, and Sandoz pure endocrine glycosides—Digilaud, the crystallized natural glycosides of digitalis lanata, Scillaren and Scillaren-B, the pure cardiodiuretic principles of squill, all standardized gravimetrically and biologically.

**SCHERING CORPORATION**

Booth 7-L

Schering will exhibit two of their products—Thyroid USP and Neo-Iopix. Thyroid USP exemplifies precision standardization on a chemical basis, Neo-Iopix is the safe intravenous urographic medium for visualization of the urinary tract, uterus and tubes, the great vessels, and other regions by the technique of introducing a radio-opaque complex organic iodide which can be rapidly eliminated from the body, unabsorbed.

**SCHERING AND GLATZ, INC.**

Booth 6-N

Professional service representatives of this firm will welcome visitors to the exhibit and will be pleased to demonstrate Sterisol ampoules, showing the ease and simplicity with which intravenous infusions of dextrose and saline solutions may be administered in the home as well as the hospital. The advantages of this container-dispenser for intravenous fluids will be shown.

**G. D. SEARLE & COMPANY**

Booths 16 and 17-S

The research activities of G. D. Searle and Co. will again be emphasized in this year's exhibit. Several members of the research staff will be present in addition to the usual complement of sales department representatives. All will be prepared to discuss with physicians any question in reference to Searle research products.

**SHARP & DOHME, INC.**

Booths 16, 17, 18-O

This modern display will feature Lyovac Normal Human Plasma, other accepted Lyovac and liquid biologicals, and accepted pharmaceutical products. Special representatives from the firm's export department will be on hand to greet Pan-American physicians. A cordial welcome will await all visitors.

**SMITH KLINE & FRENCH LABORATORIES**  
Booths 10 and 11 AA

One hundred and nine years of service to the medical profession is commemorated by this firm's exhibit. Council accepted specialties are on display and trained representatives as well as members of the Research Department, are on hand to answer questions.

**SMITH DORSEY COMPANY**  
Booth 2 R

Physicians are cordially invited to visit the Smith-Dorsey Company exhibit where they will find chocolate flavored Emulsion of Liquid Petroleum displayed. There will also be a showing of Liver Extract and Thiamin Hydrochloride, both Council accepted. Representatives from the laboratory will be in charge and will have full information regarding products shown.

**E R SQUIBB & SONS**  
Booths 13 14 15 L

Striking visual methods will be utilized to portray recent studies in the fields of nutrition, endocrinology, biological therapy and chemotherapy. By means of numerous photographs and charts the latest contributions of the Squibb research laboratories will be graphically demonstrated. Well informed representatives will be on hand to welcome visitors and furnish any information desired on the products displayed.

**FREDERICK STEARNS & COMPANY**  
Booth 18 R

Professional representatives at the Stearns booth have information for physicians on the use of their Council accepted products. You are invited to discuss them on your visit to this exhibit.

**WALLACE & TIERNAN PRODUCTS INC**  
Booth 18 P

Members of the Pharmaceutical Division staff will be on hand to greet you and discuss the Council accepted product Azochloramid employed in the prevention and control of wound infection.

**WHITE LABORATORIES**  
Booth 12 S

An exposition of the typical deficiency manifestations of two accessory food factors has been prepared for the Convention by the research staff of the laboratories. Qualified representatives will demonstrate the special features of the exhibit and present the experimental and clinical background of White's Council accepted vitamin preparations.

**WINTHROP CHEMICAL COMPANY INC**  
Booths 21 22 K 6 EE

Winthrop is giving recognition to this Pan-American Medical meeting by erecting a most unusual exhibit. The theme is South American. Come to the patio and see the refreshing scene and unique planting. Glance up at the array of flags proclaiming Western Hemisphere solidarity. Make yourself at home in this attractive atmosphere and do not hesitate to call upon Winthrop representatives for whatever aid they may be able to give you.

**WISCONSIN ALUMNI RESEARCH FOUNDATION**  
Booth 3 R

An attractive exhibit demonstrating not only the need for Vitamin D but also its important functions is presented by the Wisconsin Alumni Research Foundation. Members of the Foundation staff will be glad to provide physicians with authoritative information regarding Viosterol and Viosterol-fortified medicinals bottled Vitamin D Milk distributed by dairies and irradiated Evaporated Milk.

**JOHN WYETH & BROTHER**  
Booths 15 16 17 K

John Wyeth and Brother will exhibit for the first time Dean Cornwall's new canvas depicting Dr. Ephraim McDowell considered the father of abdominal surgery, preparing to perform the first successful ovariectomy on Jane Crawford. The painting will be shown together with the earlier canvases in the "Pioneers of American Medicine" series. Beaumont and St. Martin Osier at Old Blockley and The Conquerors of Yellow Fever.

**PHYSICAL THERAPY AND X-RAY****BEDFORD SURGICAL COMPANY**  
Booth 7 R

This exhibit will show the full line of Continental x-ray and fluoroscope equipment also the Continental Council accepted short wave diathermies, and the 1913 lines of medical office equipment.

**BURDICK CORPORATION**  
Booth 18 S

The Burdick Corporation will exhibit their line of physical therapy equipment. This includes Council accepted short wave diathermy units, infra-red and ultraviolet lamps and the Rhythmic Constrictor for the treatment of peripheral vascular conditions.

**CONTINENTAL X RAY CORPORATION**  
Booth 8 R

The item of main interest to be viewed at this display is the latest 'Pinelmaie Wall Control' available up to 500 milliamperes. It is completely automatic and incorporates many new and novel features.

**H G FISCHER & COMPANY**  
Booth 4 O

The best way to look at an x-ray apparatus is with an x-ray. You must get under the finish to see the real difference. To every visitor at the Convention, accordingly, Fischer gives this special invitation. Look under the finish of the new Fischer models of apparatus shown, including Fischer shockproof x-ray apparatus short wave units ultraviolet and other generators.

**E FOUGERA & COMPANY INC**  
Booth 4 S

The many diagnostic uses of Lipiodol will be featured at the Fougere exhibit. Roentgenograms illustrating the applicability of Lipiodol in visualizing sinus and fistula tracts, the bronchial tree, the accessory nasal sinuses, the spinal subarachnoid space and other radiolucent structures will be available for inspection. A cordial invitation is extended to all physicians.

**GENERAL ELECTRIC X RAY CORPORATION**  
Booths 3 4 and 5 H

Features of the General Electric x-ray exhibit this year will be x-ray and electro-medical units together with accessory items and supplies selected for their particular interest to the medical profession in a nation at war. A full staff of representatives will be glad to show new products and explain changes that have come about as a result of the war production program.

**HANOVIA CHEMICAL & MFG COMPANY**  
Booth 6 O

A new and more modern type of self-lighting ultraviolet quartz lamp will be on display, as well as Sollux Radiant Heat Lamps and short and ultra short wave apparatus. Physicians are encouraged to

ask for a demonstration with the new local therapy ultraviolet quartz lamp cooled by air instead of water.

**LEPEL HIGH FREQUENCY LABORATORIES**  
Booth 1 K

Physicians are cordially invited to visit the Lepel booth, where various tube and spark gap model short wave generators will be shown also the well-known induction type mercury quartz ultraviolet lamp. The medical profession is assured of continued cooperation and service on all Lepel machines as far as war priorities will permit this service.

**LIEBEL FLARSHEIM COMPANY**  
Booth 7 T

A new more efficient type of short wave applicator, the L-1 Hinged Drum, will be on demonstration here. This is used for treating any area from a small wrist to a large flat area such as the chest, and can be applied in only nine seconds. A complete line of Boyle electrosurgical units will also be on display plus other new and interesting physical therapy equipment.

**McINTOSH ELECTRICAL CORPORATION**  
Booth 2 M

Customers and friends will be cordially welcomed. The latest model of Hogan Brachytherm short wave diathermy apparatus galvanic current equipment and the Biotite Infra-Red Lamps will be displayed. Representatives will be glad to answer any questions on physical therapy technique and to demonstrate this equipment.

**F MATTEN MANUFACTURING COMPANY**  
Booths 5 6 7 8 AA

Some new and interesting developments in x-ray apparatus can be seen at the Matten booths. These will include a x-ray mobile portable unit supplied to the U.S. Navy, and a complete line of shockproof x-ray units such as Matten units with Aeromax tubes, with air circulator with Dynamax tubes with rotating anode and with water cooled Thermax tubes including radiographic and fluoroscopic units of 15 MA, 20 MA, 60 MA, 100 MA and 200 MA capacity.

**WILLIAM MEYER COMPANY**  
Booth 9 M

A special self-contained shock-proof x-ray unit for the head specialist will be exhibited also a combination dental and medical x-ray unit for clinics and hospitals or for the joint use of dentist and physician. Another feature of the Meyer exhibit will be a new portable-mobile unit with carrying cases.

**MOORADIAN HIGH FREQUENCY LABORATORIES**  
Booth 8 M

Physicians are invited to see demonstrations of the latest combination short wave diathermy and electrosurgical apparatus. This unit provides current for regular short wave therapy, and there are also available currents, under absolute control for orificial electrodes (vaginal and prostatic) and for electro-surgery. Representatives will be happy to discuss technical problems on high frequency medical and surgical apparatus.

(continued on advertising page 86)

## ACCESS TO HOSPITAL RECORDS

## SOME LEGAL ASPECTS

T. V. McDANIEL

FROM THE BUREAU OF LEGAL MEDICINE AND LEGISLATION,  
AMERICAN MEDICAL ASSOCIATION  
CHICAGO

A perplexing problem which confronts hospital administrators is the determination of a proper policy with respect to access to hospital records. What about permitting inspection of or furnishing or permitting the making of copies of hospital records of a patient? What should be commonly recognized as the ethical obligations of the hospital to its patients? The hospital occupies a confidential position with respect to its patients analogous to that occupied by the attending physician. It would be illogical for the physician to be bound professionally to keep accurate information required in his professional capacity and yet to permit the same information reduced to the case record of the patient to be disseminated indiscriminately. The proper approach it would seem is not to determine the question in the light of what liability it may be assumed by the hospital in permitting access to the records of a particular patient but rather to view the matter in the light of what duty, if any—legal, ethical or moral—there is on the hospital to permit access in any particular case. Few decisions, of courts of appellate jurisdiction—usually the only courts whose decisions are available in the published reports—can be found that are squarely in point for the purpose of the present discussion. General principles, then, seem to be the only basis from which to carry on the discussion.

On principle, it would seem that a hospital retains case records for a twofold purpose. (1) It retains them as a trustee, or in some other confidential capacity, for the patient and the attending physician and (2) it retains them as evidence of the care and attention its own servants rendered in the case. If, then, a hospital retains case records as a trustee or in some other confidential capacity for the patient and his attending physician, in theory it can make no use of those records except, of course, in defending itself from charges of negligence inconsistent with the rights and interest of the patient and the attending physician. Strictly from the patient's point of view he is entitled to privacy, that is, he has the right that the nature and incidents of his illness be not subjected to public view but only to the view of those who are acting for him and in his interest.

This general rule may be altered possibly in any particular instance by the presence of (1) some specific local law or ordinance on the matter, (2) some express contract between the hospital and the other interested parties or (3) some express hospital regulation or possibly local custom on the subject, concerning which the patient and the attending physician had actual or implied knowledge.

There must necessarily be excepted from any extended discussion instances in which any of the qualifying factors just noted are present. Obviously a general statement with respect to such situations is impossible because of unpredictable factual setups. For instance, we cannot anticipate the exact wording of a state statute or a local ordinance with respect to a governmental hospital that would permit general access to the records concerned. Nor can we hypothesize a discussion on conceivable hospital regulations or local customs with respect to the matter, furthermore, if there is an express contract entered into between the hospital, the patient and the attending physician with respect to the future use of the records concerned, the terms of that agreement, of course, will govern.

Of the qualifying factors mentioned, the most common will be instances in which some state statutes or local ordinance in specific language denominates the records of a governmental hospital as public records. The very concept of a public record implies generally a right on the part of the public to inspect on

demand. Even if there is such a statute or enactment relating to a particular governmental hospital, however, it must not be assumed that any person is legally entitled to access to the complete records of that hospital. There may be reason to draw some distinction between the right of the public to view the records maintained for or relating to administrative purposes and the public right to view that portion of the record maintained for pathologic purposes, the clinical records. Furthermore, even if there is an enactment of this type, if there is also a statute prohibiting physicians from disclosing in court information acquired in attending a patient, it is quite generally held that a governmental hospital cannot be compelled to grant access to its records to a third person (*Massachusetts Mutual Life Ins Co v Board of Trustees of Michigan Asylum for the Insane* (Mich.) 144 N W 538) and that such records if subpoenaed in court are not admissible in evidence over the patient's objection (*Davis v Knights of Honor* (N Y), 58 N E 891, *Sovereign Camp v Grandon* (Neb.) 89 N W 448, *Smart v Kansas City* (Mo.), 105 S W 709).

Coming then to the more common situation in which there is no law or enactment requiring a hospital to grant access to its records, nor any express contract relating to the matter, nor any hospital regulation or local custom that might govern the matter of access. Under such circumstances there seem to be no legal grounds on which it might be contended that any person, except possibly the patient or his attending physician, has a right of access to the records, unless by virtue of a subpoena where those records are presented in court or before some administrative tribunal. The only persons, it would seem, who can be said to have any legal right of access to a particular case record are the patient, his attending physician or son or one designated by the patient to act in his interest. It is not altogether clear that even the patient has a legal right to such access, but in view of the fact that the hospital in its compilation and custody of the record of a particular patient is acting as a trustee, in part, for the patient, the patient's interest should govern the hospital's conduct, and the primary question should not be Has the patient an enforceable legal right to inspect the records? but rather What good reason is there for denying him access? The patient may have an immediate interest in such records, either with a view to litigation or with a view to subsequent treatment to that extent he may be harmed by a refusal to permit him or his representatives to inspect or copy the records. On the other hand, if the records have been properly kept and the case properly treated, neither the hospital nor the attending physician has any real interest in denying access. In any event, if litigation occurs, the production of the records in court or before some tribunal can be compelled.

In many instances an attending physician may desire access to records with respect to a previous hospitalization of his patient during which the patient had another attending physician. In such an instance it would seem that access should be granted to the present attending physician, clearly so when the patient authorizes the hospital to do so. Even in the absence of such express authorization by the patient, access should be granted on the theory that when a patient places himself under the care of a physician he authorizes that physician to use such measures as are necessary to diagnose his condition and to determine and pursue the proper course of treatment, and obviously the records with respect to a previous hospitalization may often be of material aid to the attending physician. If a patient specifically objects to his attending physician viewing the record, the safest course for the hospital would seem to be to act in accordance with the patient's wishes.

Thus far I have discussed what seems to be the proper policy when the patient or some one acting in his interest seeks access to the records. What then should be done when access is requested or demanded by persons other than the patient or his representatives? A hospital is under no obligation to permit any one, save possibly the patient, his representatives and the attending physician, to examine or copy records of a given patient unless such examination is required by a valid statute, ordinance, regulation or an appropriate court order. For the

protection of the hospital evidence of proper authority from the patient should be required of every one other than the patient and the attending physician who desires access to the records in a given case before permitting an examination of such records. Claim agents, attorneys and representatives of insurance companies unless accompanied by the patient should be required to present written authority from the patient before access is allowed.

Probably the most frequent request or demand for access to hospital records comes from representatives of insurance companies. An insurance company is not entitled to such access even though it has insured the life, limb or health of a patient. This is true even though the insurance policy involved requires the patient to furnish the information the insurer seeks for even then the insurer should seek such information from the patient and not from the hospital. Although a contract of insurance contains express or implied authority for a hospital to give out such information, the hospital is not a party to the contract and cannot safely accede to what appears in the policy to be the patient's consent to access. It is a safer practice to require as a condition precedent to access, the written consent of the patient dated as nearly as possible to the date access is desired. If the patient refuses to sign a consent at that time or refuses to obtain the desired information for the insurance company, certainly the hospital has no right to do so on its own account.

Cases may arise that require a hospital to deviate from the rules that have been stated and to assume the responsibility of giving information without the consent of the patient, as where the patient is unconscious, delirious or seriously ill so that he himself cannot supply the information but the information is essential to the procuring of some immediate benefit to the patient or to those dependent on him. The proper officer of the hospital may then assume the responsibility, recognizing it as a responsibility, but, generally speaking, in such a case the law would presume the consent of the patient as to what is definitely for his benefit.

Finally, the question often arises as to the right of a hospital either to lend its hospital charts for research work or to use them in staff conferences or other clinical study. Whether the patient's right to privacy should yield to some extent to the cause of medical science, I am not prepared to say, as no legal authority can be found that would permit a hospital to make such use of its case records. The universality of the custom among hospitals in permitting such use of its case records may or may not have a bearing on the question. In any event the least the hospital can do is to require the consent of the attending physician and to insist that the case records be used and presented in such a way as not to reveal the identity of the patient or of the attending physician.

Of course, nothing that has been said here has reference to the making of reports required by law. Where the law requires a report to be made of a birth, of a communicable or industrial disease, of a crime or of a death that report must be made, and the law will protect the maker. Such a legal requirement would also doubtlessly protect a hospital in the making of most, if not all, of the reports required by workmen's compensation acts.

This discussion, as noted earlier, has dealt with the right of a demandant to secure access to the hospital records of a

particular patient and no discussion has been given to the liability of a hospital for making an improper, unauthorized disclosure. Conceivably such a liability could be imposed on a hospital though no case is known in which a court has held a hospital liable for damages for the unauthorized disclosure of hospital records.

In conclusion the procedure followed in permitting access to a patient's record should conform to the standards of conduct which physicians have prescribed for themselves with respect to the sanctity of confidential communications. A patient cannot well be denied the privilege of access to his own records nor may this privilege be denied his attending physician, his attorney or any other person acting with his authorization and in his interest. Furthermore such access should not also be dependent on the written consent of the attending physician. No other person should be accorded access to the records however without the patient's written permission and this rule should be rigidly enforced as against claim agents, insurance adjusters and attorneys. Any other policy would certainly serve no useful purpose for the hospital.

The accompanying form to evidence the patient's consent to access to the hospital records by a particular person is submitted for consideration. Certainly, if the execution of such a consent is required before access is permitted and if the executed form is presented by the hospital, the hospital is in a formidable position as against any potential liability to its patient and in following the procedure just suggested could also rest secure in the knowledge that its actions had been in accord with the highest medical ethics.

#### CONSENT TO ACCESS TO HOSPITAL RECORDS

To \_\_\_\_\_ [insert name of hospital superintendent]  
hospital

I ) hereby authorize and request you to furnish a copy of the hos-  
We) pital records of \_\_\_\_\_ [insert name of patient] or to allow  
those records to be inspected by \_\_\_\_\_ [insert name of grantee]  
I ) hereby release \_\_\_\_\_ hospital and you personally  
We) from all legal responsibility or liability that may arise from the act I )  
have authorized above \_\_\_\_\_ We)

Signature of patient  
Other signatures

Date \_\_\_\_\_  
Witness \_\_\_\_\_

**NOTE**—The signature of the patient alone should be sufficient in all cases except when the patient is a minor or is incompetent in which cases, in addition to the patient's signature, the signature of the parents or surviving parent or guardian respectively, should be obtained.

**Explanation**—This form when duly executed should be attached to the hospital records of the patient, with a notation as to the date on which the records were viewed or copy was furnished.

No particular form is suggested for a patient's request to be furnished a copy of or to be allowed to inspect his own records. Such a request, however, should be in writing and should be attached to the records with the notations indicated just above.

## MEDICAL LEGISLATION

### STATE MEDICAL LEGISLATION

#### Arizona

**Bills Passed**—The following bills have passed the house and senate. S 27-X, to authorize the common council of any town to own, operate and control hospitals, and H 28-X to amend the laws relating to the state hospital for the insane by providing that the superintendent of such hospital and the members of the medical staff engaged as psychiatrists need not be residents of the state.

#### Rhode Island

**Bill Passed**—S 171 has passed the house and senate, proposing to create a cash sickness compensation fund from which eligible employees will be paid weekly benefits of up to \$18 for approximately twenty weeks for such periods as, because of physical or mental disabilities they are unable to perform any services for wages. To create this fund employers of eligible workers are required to deduct 1 per cent from the first \$3,000 of each employee's wages.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS CLINICAL INTEREST SUCH AS RELATIVE TO SOCIETY ACTIVITY, THIS NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### CALIFORNIA

**Southern California Physicians' Meeting**—The Southern California Medical Association held its one hundred and sixth semiannual meeting at the Mission Inn, Riverside, April 10-11. Dr. Edwin F. Osgood, associate professor of medicine, University of Oregon Medical School, Portland, discussed "The General Principles of Chemotherapy." Included among the California physicians on the program were:

Dr. Harvey I. Bilby, Jr., lieutenant M. C. U. S. N. R., Los Angeles, A New Physiologic Approach to Muscle Rejuvenation

Dr. Edmund L. Cain, Anaheim, Krukenberg Tumor of Ovary with Endocrine Manifestation

Dr. Frederick A. Bennett, Los Angeles, Endocrine Therapy in the Management of Prostatic Carcinoma

One morning session was given over to a symposium on the emergency treatment of traumatic injuries.

### CONNECTICUT

**Personal**—Dr. George B. Davis, Milford, has been appointed the first full time health officer of Milford according to *Connecticut Health Bulletin*.—Dr. Louis H. Cohen, Norwich, has been appointed assistant clinical professor of psychiatry and mental hygiene at Yale University School of Medicine, New Haven.

**County Secretaries Resign**—Dr. James H. Burke, Rockville, has resigned as secretary of the Tolland County Medical Association to go into active service. Dr. Frank J. Oberg, Hartford, for five years secretary of the Hartford County Medical Association, resigned to become a member of the medical staff of Colt's Patent Fire Arms Manufacturing Company. Dr. Austin Kilbourn, Hartford, has been named to fill Dr. Oberg's unexpired term.

**Council for Expectant Fathers Observes Fifth Anniversary**—The New Haven Fathers' Council, sponsored by the local health department, marked its fifth anniversary, March 28, with the opening of its eleventh series of meetings for expectant fathers. More than four hundred men have attended these lectures during the past five years. The maternal health problem and the available means for further reducing maternal and infant mortality constituted the theme of the discussions. On May 4 a joint meeting for fathers and mothers will be held as part of the observance of National Child Health Week. Dr. Arnold Gesell, professor of child hygiene and director of the Clinic of Child Development at Yale University School of Medicine, New Haven, will be the speaker.

### DISTRICT OF COLUMBIA

**The Kober Lecture**—Dr. Charles Armstrong, senior surgeon, U. S. Public Health Service, Washington, gave the Kober lecture, March 28, at Georgetown University School of Medicine on "Recent Studies on Neurotropic Virus Diseases." This lectureship was inaugurated by the late Dr. George M. Kober, once dean of Georgetown, in commemoration of his fiftieth anniversary of graduation from medical school. The lecture is always given on his birthday.

**Aleš Hrdlička Retires as Curator**—Dr. Aleš Hrdlička on March 31 retired as curator of the division of physical anthropology in the U. S. National Museum, Washington, according to *Science*. He had held the position since 1910. He has been appointed an associate in anthropology and will continue his scientific research and serve in an advisory capacity. Dr. Thomas Dale Stewart, since 1931 assistant curator, has been named curator and administrative head of the division of physical anthropology. Dr. Hrdlička was born in Humpolec, Bohemia, on March 29, 1869. He graduated at the Eclectic Medical College of the City of New York in 1892 and the New York Homeopathic Medical College and Hospital in 1894. Subsequently he carried on surveys among the insane and other classes served as associate in anthropology at the New York State Pathological Institute and made anthropologic expeditions to many countries. He was assistant curator in charge of the division of physical anthropology from 1903 to 1910, when he

became curator. Dr. Hrdlička was founder of the *American Journal of Physical Anthropology*. He was also founder of the American Association of Physical Anthropology, of which he is now a life member; he served as president from 1928 to 1932. He has held various offices in many scientific societies and has contributed much to the literature on his specialty.

### FLORIDA

**Personal**—Dr. Shaler A. Richardson, Jacksonville, has resigned as a member of the state board of health to devote his full time to private practice and to his duties of secretary-treasurer of the Florida Medical Association.—Dr. Leland H. Dame, Sebring, formerly health officer for Highlands and Glades counties, has been named director of the Seminole County health unit.

**Malaria Control Activities**—Florida has been designated a proving ground for the Southeastern states in a national defense plan for malaria mosquito control activities, newspapers reported on March 18. Leon County has been selected for the trial defense malaria unit and U. S. Public Health officials in Atlanta, Ga., will collaborate. Dr. John E. Elmendorf Jr., Pensacola, director of the bureau of malaria control, Florida State Board of Health, will supervise the program.

### LOUISIANA

**Director of Industrial Hygiene**—Dr. Sherman S. Pinto, until recently associated with the Massachusetts State Division of Occupational Hygiene, Boston, has recently been named supervisor of industrial hygiene of the state department of health, New Orleans. Dr. Pinto graduated at the University of Nebraska College of Medicine, Omaha, in 1932.

**Personal**—Dr. Rudolph Matas, New Orleans, was recently presented with the Medal of Havana, the highest distinction conferred by that city, in commemoration of the anniversary of the birth of Dr. Carlos J. Finlay, Havana, Cuba, according to the state medical journal.—Dr. Walter J. Otis, New Orleans, was elected president of the New Orleans Society for Neurology and Psychiatry at a recent meeting. Dr. Clarence P. May, New Orleans, is the secretary-treasurer.—Dr. Rosecoe P. Kandle, Monroe, has been appointed director of the Calcasieu parish health unit.

**New Health Buildings**—Plans have been approved for the construction of a \$348,000 office building in Baton Rouge to house the state board of health. The new structure will contain the central laboratories of the state board and provide office space for all the division and section heads and for their departments. It is expected to be ready for occupancy in about a year. Plans have also been approved for new health centers in Alexandria and Shreveport to cost about \$100,000. Smaller units have been approved for Leesville, De Ridder, Lake Charles and Lafayette, Crowley, Natchitoches, Winnfield, Marksville, Ville Platte, Glenmora, Lecompte, Colfax, Bunkie, Oakdale, Jena, Filmore, Plain Dealing and Elm Grove. All these proposed centers are in defense areas and will provide accommodations for offices, small laboratories and clinics of the parish health units.

### MARYLAND

**Personal**—Dr. John Collinson Jr., Baltimore, has been appointed health officer of Cecil County to fill the unexpired term of the late Dr. Clinton A. Kane, Perryville.

**Society News**—The Baltimore City Medical Society was addressed among others by Dr. Maxwell M. Wintrobe, Baltimore, March 6, on "Current Views on the Diagnosis and Treatment of Nutritional Deficiencies."—The Upper Eastern Shore Medical Association was recently addressed in Denton by Dr. Charles W. Mason on activities of the Procurement and Assignment Service and Dr. William S. Love Jr., "Management of Cardiac Emergencies." Both are from Baltimore.

**New Director of Industrial Health**—Dr. Starling D. Steiner, Baltimore, has been appointed chief of the recently organized division of industrial health of the Maryland State Department of Health. Dr. Steiner was detailed to the state department by the U. S. Public Health Service in July 1941 for advisory services on occupational diseases and other health hazards in defense and other industries in the state. According to the bulletin of the state department of health, official organization of the division was completed on January 1. Preliminary services effected last year will be expanded and developed under Dr. Steiner's direction, with particular reference to the defense industries.

## MICHIGAN

**Communicable Disease Control**—Dr Henry Allen Moyer Lansing, state health commissioner has appointed a committee to study the needs for the control of communicable disease which have arisen as the result of the sudden influx of defense workers in certain areas of the state particularly where no organized health department exists. Members of the committee are

Dr Frank Van Schoick Jackson representing the state medical society  
Dr Eldred A. Thiehof Lansing representing the state department of health

Dr Edgar E. Martner Detroit representing the Michigan branch of the American Academy of Pediatrics

Mrs. Lena Sehermann R. A. Mason representing the Michigan State Nurses Association

Mr. C. Robert Koopman Lansing representing the Michigan Department of Public Instruction

The appointment of the committee was made on the recommendation of the child welfare committee of the state medical society with the approval of the society's council.

**Meeting on Industrial Health**—The Michigan Association of Industrial Physicians and Surgeons held its annual meeting in Flint April 1. One session was devoted to the theme "What's Going on in Industrial Medicine" covering a discussion of industrial medicolegal services, official state agencies available for industrial hygiene guidance, relationship between the physicians and the general medical profession, industrial toxicology and absenteeism in industry. The speakers on the program included Drs. Grover C. Penberthy, Detroit "Burns," John B. Hartzell, Detroit "Wound Healing," Nathan K. Jensen, captain Medical Reserve Corps, U. S. Army, Camp Crowder, Missouri "Use of Sulfanilamide in Wounds" and Jackson E. Livezey, Flint "Osteogenesis and Osteoporosis." The annual banquet was addressed by Dr. Clay Ray Murray, New York, on "The Operative Treatment of Fractures."

**Alumni Clinic Day**—Wayne University College of Medicine, Detroit, will observe its annual alumni clinic day May 6 with the following program:

Dr. Elmer L. Seyringhaus, Madison, Wis., "Proved Preparations in Endocrine Therapy and Their Application."

Dr. Alfred W. Adson, Rochester, Minn., "Present Status of the Surgical Treatment of Hypertension."

Dr. John T. Murphy, Toledo, Ohio, "X-Ray Treatment of Lesions of the Face."

Dr. George M. Curtis, Columbus, Ohio, "Recognition and Management of Acute Injuries to the Chest."

Dr. Plinn F. Morse, Detroit, "Diagnosis of Splenic Enlargement."

In the evening presentation of the annual alumni prize will be made by Dr. Louis J. Morand, Detroit, and Preston W. Slosson, Ph.D., professor of history, University of Michigan, Ann Arbor, will give an address entitled "Making the World Safe for Democracy: Can We Do It This Time?" Dr. Henry A. Luce, Detroit, will be the toastmaster.

## MINNESOTA

**The Christian Lecture**—Howard B. Anderson, Sc.D., principal biologist of the National Cancer Institute, National Institute of Health, Bethesda, Md., delivered the annual George Chase Christian lecture at the University of Minnesota Medical School, Minneapolis, April 15. His subject was "Recent Trends in Cancer Research."

**Abortionist Must Serve Sentence**—Mrs. Georgiann Tenneyson, 53 years of age, recently lost her appeal from a conviction for criminal abortion in the supreme court of Minnesota. Mrs. Tenneyson, who resided in St. Paul, was convicted by a jury in the district court of Ramsey County May 23, 1941 and was sentenced by Hon. Hugo O. Hanft, judge of the district court for a term of not less than two and not more than eight years at hard labor in the Women's Reformatory at Shakopee. Her sentence was doubled because of a previous conviction in 1928 on a similar charge. At that time she was known as Ann Herbert. Mrs. Tenneyson was taken to Shakopee March 6 to commence serving her sentence, according to the state board of medical examiners.

**Heart Program for Children**—A program for patients under 21 years of age with heart disease has been launched in Minnesota as a function of the bureau for crippled children of the state division of social welfare. Because of limited funds only patients from rural sections of Hennepin and Ramsey counties and Scott-Carver, McLeod and Dakota counties

will be accepted for care. Children needing convalescent care or acute cases needing hospital care will be hospitalized at the Children's Hospital, St. Paul. Emphasis will be placed on children with rheumatic heart disease who are in need of convalescent care. The state medical journal reports that Dr. Paul F. Dwan, Minneapolis, will be in charge of the clinical work. Dr. Malvin J. Nadel, Minneapolis, is head of the bureau of crippled children.

## NEW HAMPSHIRE

**State Medical Meeting**—The one hundred and fifty-first annual session of the New Hampshire Medical Society will be held at the Hotel Carpenter, Manchester, under the presidency of Dr. Charles H. Dolloff, Concord, May 12-13. A symposium on heart disease will be conducted by Drs. Paul D. White, Boston; Ashton Graybiel, Boston; Richard Schatzki, Boston; and Beatrice M. Keston, New York. Round table conferences will make up the following program:

Dr. William F. Putnam, Lane, "Rational Drug Therapy."  
Dr. John H. Kennard, Manchester, "Diagnosis and Treatment of Vaginal Bleeding."

Dr. Andrew I. MacMillan, Jr., Concord, "Methods and Problems of Vision Testing in School Children for Screening Purposes."

Dr. Louise M. Paul, Wakefield, "Anesthesia and Analgesia in Obstetrics."

Dr. Farret H. Folley, Hanover, "The Medical Management of Intestinal Obstruction with Special Reference to the Use of the Miller Abbott Tube."

Dr. Donald G. McIvor, Concord, "Acute Conditions of the Gallbladder."

Dr. Albert I. Winograd, Nashua, "Allergy in Children."

Dr. Raymond H. Marcotte, Nashua, "Meniere's Syndrome."

Dr. Ernest F. Irons, Chicago, "Aspiration Pneumonia."

Dr. Fred I. Ashur, Chicago, "Recent Treatment of Gonorrheal Infections in the Female."

Dr. William Halcyon Parker, Baltimore, "Recent Development in Therapy with Sulfonamide Drugs."

Fifty-year membership gold medals will be presented to Drs. Zatae L. Straw, Manchester, and Edwin P. Hodgdon, Lakeport. Dr. Herbert S. Hutchinson, Milford, who has been a member of the society for sixty consecutive years, will be introduced at the session. At the banquet speakers will include Governor Robert O. Blood, Concord, and Dr. Irons on "The Last Illness of Sir Joshua Reynolds."

## NEW YORK

**Society News**—The Dutchess County Medical Society was addressed on March 13 in Poughkeepsie by Dr. John J. Moorhead, lieutenant colonel, medical reserve corps, U. S. Army, New York, on "Surgical Experiences at Pearl Harbor." The Medical Society of the County of Westchester was addressed, March 17, by Drs. Wallace H. Cole, St. Paul, Minn., and Philip M. Stimson, New York, on "The Kenny Treatment of Infantile Paralysis." Dr. Reginald Fitz, Boston, spoke on "Clinical Aspects of Jaundice" at a meeting of the Broome County Medical Society on March 10 at Binghamton.

## New York City

**The Christian A. Herter Lectures**—Conrad A. Elvehjem, Ph.D., professor of biochemistry, University of Wisconsin, Madison, delivered the annual Christian A. Herter lectures at the New York University College of Medicine, April 6-7. His subjects were "Recent Advances in Our Knowledge of the Components of the Vitamin B Complex" and "The Relation of the B Vitamins to Intermediate Metabolism."

**War Time Housing**—The Museum of Modern Art opened an exhibition of war time housing, April 22, in collaboration with the National Committee on the Housing Emergency. The exhibition, which will continue to July 19, aims to show that war materials can be produced in volume to assure victory; only if workers are available to man the plants, making housing an essential to the war production program, and to show that the huge expenditures for war housing can to a large extent be conserved for the future use of the communities in the housing is planned with intelligence and foresight. The massing of workers at plants, the rapid construction of housing and the integration of such units into a community are scenes depicted in the exhibition.

**Medal Awarded to Dr. MacInnes**—The William H. Nichols Medal, which is awarded by the New York section of the American Chemical Society to stimulate original research in chemistry, was presented to Duncan A. MacInnes, Ph.D., of the Rockefeller Institute for Medical Research, at a dinner March 6. According to the *New York Times*, Dr. MacInnes was honored for "distinguished contributions to electrochem-

istry." A native of Salt Lake City, Dr MacInnes received his Ph.D. at the University of Illinois in 1911. He subsequently served on the staff there and at the Massachusetts Institute of Technology, joining the Rockefeller Institute as associate member in 1926. He was president of the Electrochemical Society from 1935 to 1937.

## NORTH CAROLINA

**State Medical Meeting in Charlotte**—The eighty-ninth annual session of the Medical Society of the State of North Carolina will be held at the Hotel Charlotte, Charlotte, May 11-13 under the presidency of Dr Franklin Webb Griffith, Asheville. Among the speakers will be Dr Paul Dudley White, Boston, on "Recent Advances in the Diagnosis and Treatment of Cardiovascular Disease" and Dr Fred W. Rankin, Lexington, Ky., President Elect of the American Medical Association who will deliver the McBrayer Memorial Lecture on "The Doctor in Washington." Other speakers will include:

Dr Henry C. Coburn, Jr., brigadier general, U. S. Army, Fort Bragg. The responsibility of the Civilian Physician in the War Emergency.  
Dr Edwin P. Meyer, Durham. Illustration for Carcinoma of the Prostate Gland.

Dr Max A. Gert, Asheville. The Treatment of Chronic Alcoholism.  
Dr W. J. Donnelly and Russell L. Holman, Chapel Hill. The Study of the Intestine of the Guinea Pig on Cellular Repair in the Kidney Tissue by Urinary Nitrate.

Dr Jesse Lee McCall, Greensboro. Morphine in Gelatin for Addiction.

Dr A. Caldwell A. Butler, Charlotte. Experience and Treatment of Central Nervous System Disorder by Prefrontal Lobotomy.

Dr J. M. A. A. Durham. The Use of Sulfonamide Derivatives in Syphilis: A Critical Review.

Dr J. L. K. Lee, Winston-Salem. Bleeding Associated with Intracerebral Drains of the Temples.

There will be a symposium on psychotherapy. The banquet will be addressed by James J. Glick, New York, on "Circumstances of the Occasion with Dr Owen Moore, Charlotte as toastmaster. Dr Walter R. Johnson, Asheville, will be presented with the Moore County Medal for the best paper read at the 1941 session for his paper on "Is Diverticulitis of the Colon a Surgical Disease." The twenty-second annual meeting of the North Carolina Public Health Association will be held at the Hotel Charlotte, May 14 and 15.

## OHIO

**Personal**—Dr Dwight I. King, Findlay, has been appointed a member of the state medical board.—Dr Elizabeth Campbell, who has practiced in Cincinnati since 1895, was recently given an honorary life membership in the American Social Hygiene Association. Dr Campbell, who recently observed her eightieth birthday, founded the Cincinnati Social Hygiene Society and is now chairman of the Cincinnati Committee on Maternal Health.

**Graduate Course in Ear, Nose and Throat**—The sixth annual graduate course in otology, rhinology and laryngology will be held at the University of Cincinnati College of Medicine, May 11-16, with members of the departments of otolaryngology and anatomy presenting the instruction. The course will include refresher work in regional anatomy and cadaver surgery in the field of otolaryngology. The work will include a course on cadavers.

**Ophthalmologist Honored**—Dr William E. Bruner, professor emeritus of ophthalmology, Western Reserve University School of Medicine, Cleveland, was honored during a recent meeting of the Cleveland Medical Library Association. His portrait was presented to the association, and an alcove in the library was named for him. The room was made possible by contributions from the Cleveland Ophthalmological Club. Dr Bruner was a charter member of the association and had served it as president, secretary, treasurer, chairman of the finance committee and member of the board of trustees.

## PENNSYLVANIA

**Society News**—Dr Luther C. Peter, Philadelphia, addressed the Reading Eye, Ear, Nose and Throat Society, April 15, on "Problems in the Management of Concomitant Squint." Dr Solon L. Rhode, Reading, was chosen president of the society at this meeting, and Dr Paul C. Craig was reelected secretary.

### Pittsburgh

**The Mellon Lecture**—Dr Herbert M. Evans, Morris Herzstein professor of biology and director of the Institute of Experimental Biology, University of California Medical School, San Francisco, delivered the Mellon Lecture, April 23, on "Unsolved Problems in Anterior Pituitary Physiology." The lecture is sponsored annually by the Society for Biologic Research of the University of Pittsburgh School of Medicine.

## RHODE ISLAND

**Society News**—The Rhode Island Society of Pathologists was addressed at its first scientific meeting at the Woonsocket Hospital, Woonsocket, March 10, by Drs Benjamin Earl Clarke, Providence, on "The Blood Bank—A General Discussion" and Louis Goodman, Howard, "Chronic Hypertensive Encephalopathy—A Report on Six Cases." Dr James T. Fallon, Providence, gave a lantern slide demonstration of the "Beriberi Heart and Nonhypertensive Cerebral Hemorrhage." This society was just recently organized.

## SOUTH CAROLINA

**County Society Opposes State Controlled Selection of Health Officer**—At a recent meeting the Medical Society of South Carolina adopted a resolution expressing "unqualified condemnation of the recently passed state law requiring the health officer of Charleston County to be elected in the primary rather than appointed by the county board of health." The resolution called on the people of the county to seek the repeal of the act in order to prevent lowering the quality of public health services administered. According to a newspaper report, the Charleston County Board of Health earlier in the day had issued a "scathing statement" pertinent to the means taken to insure this action.

## TEXAS

**New Professor of Anesthesiology**—Dr Harvey C. Slocum, for two years instructor in anesthesia at the University of Wisconsin Medical School, Madison, has been appointed professor of anesthesiology at the University of Texas School of Medicine, Galveston, and director of the department of anesthesia, the John Sealy Hospital, Galveston. Dr Slocum graduated at the University of Buffalo School of Medicine, New York, in 1932.

**Sugar Beet Workers Examined for Tuberculosis**—A new center for the examination of prospective Mexican sugar beet field workers for tuberculosis has been opened at Dallas under the auspices of the Michigan Beet Growers Association, the Texas State Health Department, the health departments of Dallas and San Antonio and the Michigan Department of Health. The first examining center was established in San Antonio. The *Journal of the Michigan State Medical Society* reports that out of 17,600 Mexicans who went through the examining center in San Antonio 400 were rejected because they had tuberculosis. The *Journal* further reports that these examinations were begun in 1937 when it was found that there were many more Mexicans receiving sanatorium care for tuberculosis at public expense than would have been expected from their numbers in the population.

## PHILIPPINE ISLANDS

**Physician Interned by Japanese**—Dr Harry D. Kneedler, retired physician of Manila, is among the persons who have been interned by the Japanese in Manila, according to recent newspaper reports. Dr Kneedler graduated at the Beaumont Hospital Medical College, St. Louis, in 1892. He left his native city of Collinsville, Ill., and in 1900 entered the army medical corps for service during the Boxer Rebellion. He later established private residence in Manila. Dr Kneedler is 71 years old.

## PUERTO RICO

**Personal**—Dr Ezequiel Martinez-Rivera, San Juan, secretary of the Puerto Rico Medical Association, was elected president of the alumni of the Puerto Rico chapter of the Alumni of Maryland. Dr Martinez-Rivera graduated at the University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, in 1921.

**Society News**—A symposium on "Consideration of Injuries and Disabilities in Connection with Hostile Aircraft Attacks on Civilian Population" was conducted at a meeting of the Medical Society of Humacao County, March 1. Among the speakers were Drs Luis Manuel Morales y Garcia, Jose Noya Benitez, Rafael Lopez Nussa, Peter E. Sabatelle, Juan A. Pons, Federico Hernandez Morales, Jacob Smith and Ramon M. Suarez, all of San Juan.—Drs Jose Forasteri and Juan J. Nogueras of Caguas were elected president and secretary respectively of the Guayama Medical Society, April 5. The meeting was addressed by Drs Oscar G. Costa-Mandry, Ramon Fernandez Marchante, Guillermo Ruiz-Cestero and Rafael A. Vilari Isern, San Juan.

## GENERAL

**Goiter Specialists Cancel Meeting**—The Council of the American Association for the Study of Goiter has announced that the annual meeting scheduled for Atlanta Ga June 1 will not be held this year on account of the present emergency.

**Directory Late**—Because of the great difficulties occasioned by the unusual and large number of changes of address of physicians and because of the difficulty of maintaining necessary office personnel there will be an unavoidable delay in the issuance of the 1942 American Medical Directory. The new edition will appear about the first of September rather than in June or July as in previous years.

**Special Meeting for Women Members at A M A Session**—A general meeting has been arranged for all medical women in attendance at the annual session of the American Medical Association in Atlantic City. The meeting will be in the form of a subscription dinner June 10 at the Ambassador Hotel at which "Service in War Time" will be the theme of discussion. The speakers will include Mr Stuart Rand, Boston attorney, and Col George Bachr, Washington D C.

**American Diabetes Association**—The annual session of the American Diabetes Association will be held at the Chalfonte-Haddon Hall, Atlantic City N J June 7 under the presidency of Dr Herman O Mosenthal, New York. Speakers will include:

Dr Franklin B Peck Indianapolis Action of Insulin  
Dr Joseph T Beardwood Jr Philadelphia The Diabetes in the Defense Program  
Dr Cyril N H Long New Haven Conn Endocrine Control of Carbohydrate Metabolism in Relation to Human Diabetes  
Dr Samuel Sothin Chicago The Storage and Significance of Tissue Glycogen in Health and Disease  
Dr Eaton M MacKay La Jolla Calif Acidosis  
Dr Harold E Hummel Albany N Y Hypoglycemic Reactions

Dr William Muhlbarg Cincinnati, will deliver the Banting Memorial Lecture at the dinner session in the evening on "An Analysis of Statistics Bearing on Diabetes Mellitus."

**Association of Cereal Chemists**—The American Association of Cereal Chemists will be held at the Edgewater Beach Hotel, Chicago, May 18-21. Sessions have been arranged under the following headings: Agronomy and Milling Technology, Laboratory Baking Methods, Malting and Brewing, Protein Symposium, Bread Baking Technology, General Analytical Methods, Symposium on Flour and Bread Nutritional Supplements. A statistical clinic will be held jointly with the biometric section of the American Statistical Association. Among the speakers on the general program will be Thorfin R Hogness, Ph D, Chicago, on "Respiratory Enzymes and Their Relationship to Some of the Vitamins", Conrad A Elvehjem, Ph D, Madison, Wis, "The Water Soluble Vitamins" and Ross A Gortner, Ph D, University of Minnesota, Minneapolis, who will give the Osborne Medal Award address on the "Plant Proteins".

**Meeting of Eye and Ear Specialists**—The thirtieth annual session of the Pacific Coast Oto-Ophthalmological Society will be held at the Benson Hotel, Portland, Ore, May 11-13 under the presidency of Dr Ralph A Fenton, Portland, whose address will be entitled "War and Peace." Among the speakers will be the following:

Dr Gordon B New Rochester Minn, Immediate and Later Care of Facial Injuries  
Dr Augustus G Pohlman Los Angeles Hearing Aids  
Dr Phillips Thygeson New York The Sulfanilamide Group  
Dr John E Raaf Portland Perimetric Diagnosis of Intracranial Lesions

A special motion picture program has been planned as well as the following instruction courses: manifest refraction eye surgery treatment of acute and chronic sinusitis endaural surgery, recent advances in ophthalmology, ophthalmic injuries in war, audiometric interpretation, sulfa-therapy, sinus surgery, and lesions of the larynx.

**Examinations in Urology**—The American Board of Urology Inc announces that if a sufficient number of applications are received from urologists fulfilling all the requirements of applicants a meeting for the purpose of examining candidates for certification will be held in some eastern city at the same time or shortly following one of the national medical meetings, the place and time to be published later. This decision is a response to the many urgent requests for a second examination from urologists who are now in the medical corps of the army or navy services and from others who expect to be called for active duty before the usual time of the board's yearly examination which is in February. Application blanks may be obtained from the secretary, Dr Gilbert J Thomas, 1409

Willow Street Minneapolis. These should be completed and returned to the secretary without delay. Candidates who wish to be examined at this proposed meeting should start the preparation of fifty case histories at once.

**Special Society Elections**—Dr Paul D White, Boston, was recently elected president of the American Heart Association at its meeting in New York. Other officers include Drs Roy W Scott, Cleveland, vice president, T Homer Coffin Portland Ore treasurer, and Howard B Sprague Boston secretary. Dr Elmer L Henderson, Louisville was named president-elect of the Southeastern Surgical Congress at the recent session in Atlanta and Dr Edward W Alton Ochsner New Orleans was inducted into the presidency. Dr Frederick J Wias, Jacksonville was chosen vice president and Dr Benjamin T Berslev, Atlanta, was reelected secretary-treasurer. The 1943 session will be in Louisville. Dr Paul R Cannon Chicago, was chosen president of the American Association of Pathologists and Bacteriologists at its annual meeting April 2-3 in St Louis. Other officers include Drs Wiley D Forbes, Durham, N C vice president, Howard T Karsner Cleveland secretary, and Alan R Moritz, Boston, treasurer. The gold headed cane of the association was presented to Dr James Ewing, New York.

**Society for Clinical Investigation**—The thirty-fourth annual meeting of the American Society for Clinical Investigation will be held at the Chalfonte-Haddon Hall Atlantic City May 4, under the presidency of Dr William Dock, New York. The program includes the following speakers:

Dr William W Beckman and Kendall Emerson Jr, New York A Study of Cerebral Metabolism in Nephrosis  
Dr Jacob Lerman Boston Insulin Resistance  
Dr Robert H Williams and Enrique Egrna Boston Alterations in Biologic Oxidations in Thyrotoxicosis  
Dr Willis F Evans and Harold J Stewart New York The Effect of Cigarette Smoking on the Peripheral Blood Flow  
Dr Byron E Hall Horton C Hinshaw Rochester Minn and Karl H Pfeulze Cannon Falls Minn The Effect of Promin on the Blood of Tuberculosis Patients  
Dr Lawrence H Beizer and Charles H Watkins Rochester Sternal Marrow in Aplastic Anemia  
Dr Robert A Goodwin Jr and Maxwell Finland Boston Studies on the Persistence of Pneumococci in Patients with Pneumonia Treated with Sulfonamide Drugs  
Drs Robert F Parker Cleveland and Robert H Green New York The Effect of Separate Inoculation of Vaccine Virus and Immune Serum on the Protection Test  
Dr Joseph E Smadel New York Aseptic Meningitis of Known and Unknown Etiology

**National Gastroenterological Association**—The seventh annual convention of the National Gastroenterological Association will be held at the Hotel Astor, New York, June 3-4, under the presidency of Dr Anthony Bassler New York. The preliminary program lists the following speakers, among others:

Dr Marvin H Smith Miami, Fla The Role of the Gram Positive Diplococcus and Other Pathogens in the Stagnant Colon  
Drs George P Wiley Philadelphia and Elmer W Rebbeck Pittsburgh The Knott Technique of Ultraviolet Blood Irradiation as a Control of Infection in Peritonitis  
Drs Edward W Alton Ochsner and Michael E DeBakey New Orleans Amebic Hepatitis and Amebic Hepatic Abscess  
Dr George T Pack New York Surgery of Gastric Carcinoma  
Drs Frank E Hamilton and George M Curtis Columbus The Action of Drugs on the Motility of the Human Stomach  
Dr John F Erdmann New York Surgical Treatment of Gallbladder Disease

A round table conference will be held the first day on "The Action of Drugs on the Gastrointestinal Tract." Col John J Moorhead, M C, U S Army, New York, will address a military luncheon Thursday on "Treatment of Casualties at Pearl Harbor."

**Annual Report of Mellon Institute**—A total of \$1,378,752 to carry on the various science projects was expended by the Mellon Institute of Industrial Research, Pittsburgh, during the fiscal year ended March 1, according to its twenty-ninth annual report. The industrial research staff was expanded during the year to 205 fellows from 187 and to 150 fellowship assistants from 114. Nine new industrial fellowships started their researches during the year. The report discusses the studies of modified cinchona alkaloids and related synthetics carried on by the department of research in pure chemistry. In the results to date there has been no beneficial action of quinine which cannot be accomplished equally well by hydroxyethylapocuprene. In studies for the twelfth revision of the U S Pharmacopeia different assay procedures for new synthetic organic chemicals have been evaluated. The projects subsidized by the Mellon Institute at the Institute of Pathology of the Western Pennsylvania Hospital have related to chemotherapeutic and bacteriologic researches largely pertaining to the effects of the sulfonamides. Industrial Hygiene Foundation which maintains its headquarters at the institute has been

studying sick absenteeism in the industries and a project on fatigue is under way. The multiple fellowship on food varieties at the institute has begun a survey of food flavors. The present emergency has caused an expansion in the activities of certain fellowships, however, the range of the programs of most fellowships has regard for postwar economic problems.

**Accidental Deaths Increase in 1941**—A total of 101,500 persons were killed in accidents in 1941 as against 96,885 killed in 1940, according to an annual report from the National Safety Council. Motor vehicles were responsible for 40,000 deaths during 1941 as compared with 34,501 in 1940. Accidents in the home aggregated 32,000 as against 33,000 reported during the previous year. Occupational accidents accounted for 18,000 deaths in the latter year and 17,000 in 1940. The report pointed out that the traffic deaths of 40,000 was an all-time high. Traffic deaths went up 16 per cent and travel increased 11 per cent giving a mileage death rate increase of 4 per cent. In industry the 6 per cent increase in deaths was far less than the 17 per cent rise in employment in the manufacturing industry and the 9 per cent gain in total nonagricultural employment. A total of 9,300,000 persons were injured during 1941 and an estimated cost for both injuries and accidents was \$1,750,000,000. This cost covers both fatal and nonfatal accidents and includes wage losses, medical expense, the overhead costs of insurance, and property damage from motor vehicle accidents and fires. There were other large but less tangible losses, such as interruption of industrial production. Persons 65 years and older were the only group with a better accident record in 1941 than in 1940. The school child group (5 to 14 years) had a 10 per cent increase with deaths totaling 7,100. This increase was exceeded only by the 12 per cent rise shown for the 15-24 year group in which deaths totaled 14,250. The 25-64 year group accounted for 45,350 fatalities—a 5 per cent rise. There were 7,150 deaths of children under 5 years of age, a 4 per cent increase. Deaths from falls were about the same in 1941 as in 1940—about 26,000 each year. Falls are second only to motor vehicle accidents as a cause of accidental death. Deaths from burns were about 6,900 in 1941, a 5 per cent drop from 1940. Drownings increased about 2 per cent to 7,000. Last year was the first one in the last decade in which no catastrophe took as many as 100 lives. Forty-one cities of 10,000 or more completed 1941 without a fatal motor vehicle traffic accident. The largest was Chelsea, Mass., with a population of 41,260. The second and third largest perfect cities were University City, Mo., and Hagerstown, Md. About 13,900 pedestrians were injured fatally in motor accidents in 1941, an 11 per cent increase over 1940. Nonpedestrian deaths increased 19 per cent to 26,100. Fatal falls accounted for almost 16,300 home accident deaths in 1941, 2 per cent fewer than in 1940. Home falls accounted for slightly more than half the home death total. Burns and fires in homes killed about 5,500 persons, a 4 per cent decrease over the previous year. Falls on stairs and steps are the most important specific type of serious home accident. Railroad accidents caused 4,647 deaths in the first eleven months of 1941, 11 per cent more than the comparable 1940 total of 4,188. There were four fatal aviation crashes during 1941 in the domestic operations of scheduled air carriers resulting in the death of thirty-five passengers and nine members of the crews. Passenger miles flown totaled about 1,480,000,000, indicating a passenger death rate of 2.4 per hundred million miles.

#### Deaths in Other Countries

**Kenneth Mackenzie**, Auckland, New Zealand, graduated at Edinburgh University in 1911, fellow of the Royal College of Surgeons, since 1914 an honorary surgeon to the Auckland Hospital, examiner in physiology to the University of Otago, 1914-1916, founder of the Auckland Clinical Society, serving as president in 1923, at one time president of the Auckland division of the British Medical Association, died on January 15, aged 57. Mr. Mackenzie served in the New Zealand Medical Corps from 1917 to 1918 with the rank of captain.

#### CORRECTION

**Dr. J. McKen Cattell**, Founder of Psychology Laboratory—In THE JOURNAL, March 28, page 1151, Dr. McKen Cattell, associate professor of pharmacology in charge of the department at Cornell University Medical College, New York, was erroneously reported to be the founder of the laboratory of psychology at Columbia University. The founder of the laboratory was James McKen Cattell, Ph.D., the father of Dr. McKen Cattell, pharmacologist.

## Government Services

### Medical Director Creel Retires

Medical Director Richard H. Creel, San Francisco, director of activities of the U. S. Public Health Service of Western States, Alaska and Hawaii, has retired from the service after more than forty years' service. He has been succeeded by Dr. Walter T. Harrison, senior surgeon and liaison officer between the U. S. Public Health Service and the war department, San Francisco. Dr. Creel was born in Missouri in 1878 and graduated at the University Medical College, Kansas City, in 1900. He has been with the U. S. Public Health Service since July 27, 1902. His research activities have covered plague, cholera and typhoid dissemination.

### Annual Report of Food and Drug Administration

A report has been issued for the Food and Drug Administration for the fiscal year ended June 30, 1941, the first in which the administration was operated as a unit of the Federal Security Agency. This year was also the first in which all provisions of the Food, Drug and Cosmetic Act of 1938 became fully effective. During the year, a dangerously contaminated drug product and a poisonous permanent wave solution, both widely distributed, were removed from the market. In March 1941 a fatality occurred from the permanent wave solution, and during April and May 17,061 units in possession of some 500 beauty shops licensed by the manufacturer to administer it were seized in 1,906 actions. Eyelash dyes containing toluidine diamine were the object of six seizures, and prosecution proceedings were instituted against the firm responsible for their shipment in interstate commerce.

On March 21, 1941 the administration started an investigation to remove from commercial channels thousands of sulfathiazole tablets contaminated with as much as 60 per cent phenobarbital. This task involved 3,205 man days of work, 12,187 visits to distributors, physicians and druggists, excluding an additional 25,000 known visits by cooperating agencies and necessitated the examination of about 1,593,000 invoices and 592,000 prescriptions. At the start of the investigation some 122,600 contaminated tablets were still outstanding and unrecovered. There were 23,324 tablets, including sixty-six separate lots of contaminated tablets, recovered finally. It is presumed that the 99,300 tablets which remained outstanding at the conclusion of the investigation may be presumed to have been consumed, or voluntarily destroyed, or taken up as samples by state and local health departments. The task of discovery was complicated by reason of the failure of all those handling the tablets to provide a system for recording control numbers.

Actions directed against dangerous drug preparations resulted in sixty-seven seizures and twelve prosecutions as compared with twenty-five seizures and one prosecution in 1940. On July 1, 1940 the requirement of the U. S. Pharmacopoeia that absorbent cotton must be sterile became effective. Twelve lots were found to be not sterile. A total of 1,145 official samples of proprietary medicine for human use was examined. Seizures increased from forty-six to seventy-eight and the number of shippers against whom criminal prosecution proceedings were instituted from eleven to thirty-five. There were only six seizures of deceptively packaged drugs made as compared with twenty-three of the previous year.

During the year, 1,376 new drug applications were received, making the total since June 25, 1938, when the new drug section of the act became effective, 4,128.

A total of 470 official samples of vitamin products was assayed for vitamin control. Of these 391 were from interstate shipments and 79 were imports. Seventy-nine interstate shipments, or about one sixth of the total examined, were found to be deficient in one or more of the vitamins.

Terminated criminal actions during the fiscal year based on violations of the Food, Drug and Cosmetic Act numbered 183 and resulted in the imposition of fines totaling \$35,262, ten jail sentences were imposed, one of which was actually served and the remainder were suspended and the defendants placed on probation. There were 142 pleas of guilty, 32 pleas of not guilty and 9 contested cases. Of the last group, 2 defendants were acquitted.

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

March 14, 1942

#### Children Have Stood Air Raids Well

Inquiries about the effect of air raids on London school children have been made by the physicians working daily in school rest centers and in examining those registered for evacuation. The unanimous response is that there is no evidence of nervous disorder or shock arising from air raid experience but that the children are standing up to the raids as well as or better than adults. This statement is contained in the interim report for 1940 of Dr. W. Allen Daily, medical officer and school medical officer for London. He also states that air raid casualties generally in London did not reach the number anticipated and for which hospital preparation had been made. His report also shows that in spite of the difficulties produced by the war the health of London has not been unsatisfactory and that the vast and complex organization of the public health department has continued to provide not only for the sick who apply to its hospitals but also to carry on its preventive work. No case of smallpox was notified during the year, London has been free from the disease since 1934. There was no serious epidemic of infectious disease.

#### Women's Help in Civil Defense

A tribute to the women of Britain for civil defense work was paid by the home secretary, Mr. Herbert Morrison, at a conference held by the Women's Voluntary Services. Two things had impressed him: the enormous voluntary effort mobilized in the service of British homes after the enemy air attacks and the ability of women in large scale organization. The movement had organized the part time and whole time voluntary services of over a million women. They would play a part in the building of a better and wiser society after the war. Among their services were the organization of rest centers after air raids, loading canteens and driving them off in convoy at night, sometimes into the heart of an air raid, collecting salvage, collecting and distributing emergency clothing for the bombed out, helping British restaurants and school canteens, getting evacuated children settled down, running clubs for mothers and distributing overseas gifts.

#### The Destruction of the Museum of the Royal College of Surgeons

The destruction wrought by German bombs in the greatest anatomic and pathologic museum in the world has been described in previous letters. Much of what was destroyed is irreplaceable. The report of the Royal College of Surgeons for 1940-1941 enables a more detailed account to be given. The total loss of specimens was 39,259 out of 65,827. Before the bombs fell, most of the specimens had been removed to the basements, which had been reinforced. But unfortunately on May 10, 1941 a heavy bomb struck the museum and store rooms, and incendiaries increased the damage. Fallen girders broke open the basements below, and on the following days there was a heavy rainfall which drenched the exposed specimens. In the anatomic series 1,207 specimens survived out of 2,569. The famous collection of John Hunter is the basis of the museum and had historical as well as scientific value. The loss of his specimens is therefore irreplaceable. In the osteologic series only 94 out of 1,655 hunterian specimens survive and 6,209 out of 15,545 other specimens, but the whole odontologic series, which includes hunterian specimens, remains. In the physiologic series nearly half of the 5,400 hunterian specimens remain, but

only 2,026 of the others which numbered 14,850. In the human and comparative teratologic series only 23 out of 170 hunterian specimens survive, but the other specimens have largely escaped damage. The greater part of the hunterian pathologic series remains, but the others have been reduced to a fifth. The Army Medical War Collection (formed after the previous war) has been reduced from 3,000 to 100. The replacing of this collection by specimens from the present war has already begun. All the mummy specimens and the historical collection are lost. The instrument collection of 2,500 has been reduced to 2,000. The salvaged specimens have been transferred to seventeen widely separated places. For this work the American Ambulance Service, now working in Britain, has provided the transport.

#### The Mode of Action of Chemotherapeutic Agents

At a meeting of the Biochemical Society a discussion took place on the mode of action of chemotherapeutic agents. Dr. G. M. Findlay classified chemotherapeutic action as direct and indirect. Except for intestinal parasites it was necessary that the drug should be absorbed into the body, penetrate to the site of the parasites and not be excreted or converted too rapidly into an inert form. When the drug had been brought to the parasite, three stages might be distinguished: adsorption, interference with metabolism and death of or such injury to the parasite that it was destroyed by phagocytes. When adsorbed the drug might prevent an essential food factor from being absorbed by the parasite or cause a breakdown in metabolism by combining with a specific substrate or competing with an essential cell metabolite for an enzyme or coenzyme. Specific immune serum and sulfapyridine did not compete for the same receptor group in the pneumococcus and might therefore enhance each other. Indirect action might produce such changes in the environment that parasites could no longer grow.

Sir Henry Dale said that one of Ehrlich's notable contributions to the subject was a theory which, though it probably would not survive unmodified, had given a tremendous stimulus to research. His explanation of the action of certain dyes on trypanosome infection as confined to injury of the reproductive power of the parasite seemed at the time artificial and unconvincing. But when Dobell and Laidlaw were able to grow *Endameba histolytica* in permanent culture it was found that the action of emetine was just of this type. Effective chemotherapy was usually, if not always, a war of attrition. Sulfaguanidine seemed to owe its effectiveness in bacterial dysentery to low solubility, enabling it to keep up a steady low concentration in contact with the infected mucous membrane. Aromatic diamidines might owe part of their superiority to limited solubility. He suggested as a means of advancing chemotherapy the keeping alive and reproduction indefinitely of trypanosomes in artificial culture and the discovery of a method of treating a strain of trypanosomes which had acquired drug resistance so as to restore the normal susceptibility.

#### Cupboards for the Nation's Food

One thing the government has succeeded in is ensuring that the people, though rationed, have sufficient food. Ample precautions have been taken against destruction of food supplies by enemy action. The hundredth "store cupboard"—single storied buildings each covering an area of 25,000 square feet—has been completed, and forty more, the beginning of a new program of one hundred and twenty-seven, have been put in hand. The store cupboards are camouflaged buildings of prefabricated steel with concrete floors, brick walls, steel and corrugated asbestos roofs. They are dotted about the country. The hundred completed take something like 1,000,000 tons of the nation's reserve food and raw supplies. They were completed in eight months and each cost \$50,000.

## RIO DE JANEIRO

(From Our Regular Correspondent)

March 26, 1942

## Vital Statistics of Rio de Janeiro

The vital statistics returns for the city of Rio de Janeiro for 1941 have just been published. The population of the city as of July 1, 1941 was 1,813,730. The total number of deaths from all causes was 32,440, giving an annual crude death rate of 17.89 per thousand of population, which makes 1941 a bad year, as there is no reduction of the death rate compared to the five year period 1936-1940, for which the mean annual crude death rate was 17.43 per thousand. The number of live births registered was 34,096, giving a birth rate of 19.28 per thousand of population. The vital index was 108, a rather low figure to express the vitality of the population. The number of deaths for the age group 0-1 year was 6,706, which corresponds to the high figure of 180 infant deaths per thousand live births. First is a cause of death are "all forms of tuberculosis" with the total of 5,731 deaths (5,588 from tuberculosis of the respiratory apparatus), or 17.07 per cent of the total of deaths from all causes—a crude specific death rate of 316 per hundred thousand of population. The rest of the "infectious and parasitic diseases" caused 1,291 deaths which, with the deaths from tuberculosis gives a total of 10,022 deaths from infectious and parasitic diseases (30.89 per cent of the deaths from all causes). Of this total 130 were from typhoid (7.17 per hundred thousand of population). The other principal infections were dysentery mainly bacillary, measles 218, or 12.02 per hundred thousand, whooping cough 283, or 15.60 per hundred thousand, diphtheria 192, or 10.59 per hundred thousand, malaria 219, or 12.07 per hundred thousand, and leprosy 57, or 3.14 per hundred thousand. Cancer has caused 1,205 deaths, or 66.44 per hundred thousand, thus being on a continuous increase since 1903-1907, when the mean annual crude death rate was 34.75. The second most important single group of causes of death is that of the diseases of the circulatory system, represented by a total of 5,593 deaths, or 17.24 per cent of the deaths from all causes, which corresponds to the rate of 308 per hundred thousand. Out of this total 3,927 deaths have been reported as due to diseases of the heart, which corresponds to the rate of 217 per hundred thousand. This represents a great increase in the number of deaths from diseases of the circulatory apparatus. The crude specific death rate from diseases of the cardiovascular system is on the increase in Rio de Janeiro, as clearly shown by these figures: 173 in 1926-1930, 174 in 1931-1935, 212 in 1936-1940 and 308 in 1941. The third leading group of causes of death is the diseases of the digestive apparatus, represented by 4,986 deaths, or 15.37 per cent of the deaths from all causes, which corresponds to 275 deaths per hundred thousand of population. The bulk of these deaths is reported under the title of "diarrhea and enteritis under 2 years" (3,416 deaths), which is the largest contribution to the infant mortality, an average of 38 per cent of the infant deaths, in Rio de Janeiro, is classified as due to diarrheal diseases. The diseases of the respiratory apparatus caused 3,893 deaths, or 12 per cent of the total from all causes, and to a death rate of 215 per hundred thousand. Puerperal septicemia and infection was the cause of 124 deaths, or 43.05 per cent of the maternal deaths (one death in 282 live births). Violent deaths were 1,205, or 3.71 per cent of the total of deaths from all causes, which corresponds to the rate of 66.44 per hundred thousand of population.

## A New University School of Nursing

The International Health Division of the Rockefeller Foundation has decided to cooperate with the University of São Paulo to found a school of nursing of a high standard. Miss Mary E. Tennant, staff member of the International Health

Division, has arrived in São Paulo to study local conditions. The first school of nursing of high standing in Brazil, the Ana Neri School of Nursing, is now in operation at the University of Rio de Janeiro. This pioneer school was founded in 1923 at the Brazilian Federal Health Service soon after the visit of Dr. Carlos Chagas to the United States as a guest of the Rockefeller Foundation. The school a few years ago was transferred to the university. It trained the first registered nurses to operate the nursing division of the Rio de Janeiro city health department under the supervision of Mrs. Ethel Parsons, then a member of the staff of the Rockefeller Foundation. The work of Mrs. Parsons has been highly praised for the introduction of Public Health Nursing in Brazil. The School for Nurses of São Paulo is the second institution of this kind to be operated in connection with a University in Brazil.

## BCG Immunization

The high incidence of tuberculosis in Rio de Janeiro makes the steps taken against this disease one of the most important public health problems. Among the measures that the city health department is putting into practice, BCG immunization is carried out in cooperation with the Ataulfo de Paiva Foundation under the supervision of Dr. Arlindo de Assis, a skilled bacteriologist who is now studying special phases of the anti-tuberculosis work. To be able to ascertain exactly the results of this immunization, Dr. de Assis is carefully recording every detail in connection with the present work. The high prevalence of tuberculosis in the city enables Dr. de Assis to give BCG vaccine to every newborn infant without taking into consideration whether the child lives in a tuberculous environment or not. As a routine the immunization is done on the third, the fifth and the seventh day after birth, but occasionally it may begin even on the second day or as late as the tenth day. In the families known to be free from tuberculosis the immunization is done even on the fifteenth and the twentieth day. After that time, however, the immunization is always postponed to six months later, when the child will be tuberculin tested, and always if the result of this test is negative. After the immediate postnatal period, all persons may be immunized, regardless of age, provided they will not react to raw tuberculin.

## Brief Items

Dr. A. Lemos Torres, director of the Paulista School of Medicine in São Paulo, died recently in that city. Prof. Lemos Torres was an able internist, known also in England, France, Germany and the United States, where he visited in 1919, 1921 and 1923.

A new course of hygiene and public health has been founded in connection with the Hygienic Institute of the University of São Paulo to train sanitarians for the positions of health officers in the departments of health in Brazil. There is another course of the same kind, run in connection with the Oswaldo Cruz Institute, founded in 1926 in the University of Rio de Janeiro and recently transferred to the institute in this city.

A Brazilian academy of military medicine has been founded in Rio de Janeiro to study the special subjects of military medicine. The members of the academy are elected from the staff physicians of the army, the navy and the air service. Dr. Florencio de Abreu, colonel of the medical corps of the army, has been elected president of the academy.

Dr. Oscar Silva Araujo, noted dermatologist and leprologist, who assisted Prof. Eduardo Rabello in 1920 in the establishment of the Division of Venereal Diseases in the Brazilian Public Health Service, died recently in Rio de Janeiro. Dr. Silva Araujo succeeded Professor Rabello as chief of the division of venereal diseases and was well known in his specialty abroad. He has published many contributions on dermatology, syphilology and leprosy.

## Deaths

**I Seth Hirsch** @ New York, Columbia University College of Physicians and Surgeons, New York, 1902, professor of radiology at the New York University College of Medicine, professor of roentgenology at the New York Post-Graduate Medical School from 1914 to 1917, served during World War I, member and formerly vice president of the Radiological Society of North America, Inc., fellow of the American College of Physicians, director of the x-ray departments of the Bellevue and Allied Hospitals from 1910 to 1926, for many years director of the x-ray department of the Beth Israel Hospital, x-ray consultant to the New York State Compensation Commission, author of "Principles and Practice of Roentgenological Technique" published in 1920 and "Principles and Practices of Roentgen Therapy" published in 1925, aged 61, died, March 24, in the Mount Sinai Hospital of cardiovascular disease.

**Rome Haward Walker** @ Charleston W Va., College of Physicians and Surgeons, Baltimore, 1914, member of the House of Delegates of the American Medical Association in 1932, member of the Southeastern Surgical Congress, fellow of the American College of Surgeons, past president of the West Virginia State Medical Association and the Kanawha Medical Society, served during World War I, in 1921 was appointed medical examiner to the Workmen's Compensation Department and served in that capacity until 1929, chairman of the state committee on medical preparedness and medical chairman of the Procurement and Assignment Service of West Virginia, aged 53, on the staff of the Mountain State Hospital, where he died, February 19, of sarcoma.

**Louis Gustavus Nolte**, Milwaukee, College of Physicians and Surgeons, medical department of Columbia College, New York, 1886, member of the State Medical Society of Wisconsin, past president of the Medical Society of Milwaukee County, fellow of the American College of Surgeons, professor of surgery at the Milwaukee Medical College, 1911-1912, police surgeon from 1890 to 1896, surgeon, Evangelical Deaconess, Trinity, Misericordia and Johnston Emergency hospitals, consulting surgeon, Milwaukee County Hospital, Wauwatosa, aged 79, died, February 15, of coronary occlusion.

**Henry Flanagan Pipes** @ Colonel, M C, U S Army, Washington, D C, Columbian University Medical Department, Washington, 1902, entered the army in July 1903 and rose through the various grades to that of colonel in July 1929, fellow of the American College of Surgeons, at one time instructor in operative surgery and x-ray work in the Army Medical School, at one time in the office of the Surgeon General, on the staff of the U S Soldiers' Home Hospital, aged 63, died, February 19, at the Walter Reed General Hospital of coronary thrombosis.

**William Joseph Ryan** @ Pomona, N Y, Albany Medical College, 1915, fellow of the American College of Physicians, secretary and past president of the Rockland County Medical Society, served during World War I, consultant in diseases of the chest, Nyack (N Y) Hospital, Good Samaritan Hospital, Suffern, Rockland State Hospital, Orangeburg, Tuxedo Memorial Hospital, Tuxedo Park and the Letchworth Village, Thells superintendent and medical director of the Summit Park Sanatorium, where he died, February 20, of coronary thrombosis, aged 52.

**Ross A Woolsey** @ St Louis, St Louis University School of Medicine, 1904, member of the House of Delegates of the American Medical Association in 1923, past president of the Missouri State Medical Association, member of the Western Surgical Association, Southern Surgical Association and the American Association for the Surgery of Trauma, fellow of the American College of Surgeons, medical director and superintendent of the Frisco Employees' Hospital, aged 64, was killed February 23, in an automobile accident.

**Albert Keidel**, Baltimore, Johns Hopkins University School of Medicine, Baltimore, 1903, at various times assistant, instructor, associate, associate professor and associate professor emeritus of medicine at his alma mater, member of the American Clinical and Climatological Association, served in various capacities on the staff of the Johns Hopkins Hospital, aged 64, died, February 8, in the Sheppard and Enoch Pratt Hospital, Towson, Md, of meningitis following a skull fracture.

**Joseph Harold St John** @ Lieutenant Colonel, M C, U S Army, retired Washington, D C, Vanderbilt University School of Medicine, Nashville, Tenn, 1915, entered the medical corps of the U S Army as a first lieutenant in 1918, rose through the various grades to that of lieutenant colonel in 1937, retired,

Oct 31 1940, for many years instructor of parasitology at the Army Medical School, and from 1928 to 1930 a member of the Medical Department Research Board of the United States Army, aged 50, died, February 17, of coronary occlusion.

**Alphonse Francis Pirnie**, Little Rock, Ark., Columbia University College of Physicians and Surgeons, New York, 1927, member of the Arkansas Medical Society, assistant professor of pathology at the University of Arkansas School of Medicine, served as a lieutenant with the Chemical Warfare Division of the French army during World War I, on the staff of the Baptist State, St Vincent's, University and Arkansas Children's Home hospitals, aged 49, died, February 2, of carcinoma of the pancreas.

**Frank Dyckman Scudder** @ Montclair, N J, Columbia University College of Physicians and Surgeons, New York, 1914, fellow of the American College of Surgeons, served during World War I, attending surgeon, Mountside Hospital, Montclair, Essex County Hospital for Contagious Diseases, Belleville, and consulting surgeon, Newton Memorial Hospital, Newton, aged 54, died, February 7, of coronary thrombosis.

**James Aloysius Walsh** @ Pittsburgh, Jefferson Medical College of Philadelphia 1925, assistant demonstrator of pathology at his alma mater, 1926-1927, fellow of the American College of Surgeons, served during World War I, on the courtesy staff of the Woman's Hospital, on the staffs of St Joseph's Hospital and the Rosalia Maternity Hospital, aged 43, died, February 22, of coronary occlusion.

**Herbert Ralph Stockwell** @ Ann Arbor, Mich., Ohio State University College of Medicine, Columbus, 1928, member of the Ohio State Medical Association, instructor of orthopedic surgery at the University of Michigan Medical School, 1941-1942, formerly on the staff of the Miami Valley Hospital, Dayton, aged 40, died February 25, in the University Hospital of coronary thrombosis.

**Wallace Fahnestock Grosvenor** @ Chicago, Chicago Homopathic Medical College, 1895, Rush Medical College, Chicago, 1900, fellow of the American College of Surgeons, formerly associate in obstetrics and gynecology at the Rush Medical College, attending obstetrician and gynecologist, St Joseph Hospital and the Ravenswood Hospital, aged 72, died, March 3.

**Jack Gossett Hutton** @ Denver, Western Reserve University School of Medicine, Cleveland, 1921, assistant professor of dermatology and syphilology at the University of Colorado School of Medicine, member of the American Academy of Dermatology and Syphilology, aged 47, died, February 28, in St Louis following an operation for bronchoesophageal fistula.

**Dan Hiter Witt** @ New York, University of Virginia Department of Medicine, Charlottesville, 1914, instructor of medicine at the Cornell University Medical College, served during World War I, aged 51, on the staffs of the Manhattan Eye, Ear and Throat Hospital and the New York Hospital, where he died, February 15, of subdural hematoma.

**Harry Osro Taylor**, Anna, Ill., National University of Arts and Sciences Medical Department, St Louis, 1918, member of the Illinois State Medical Society, in 1941 president of the Union County Medical Society, county coroner, aged 61, died, February 13, in the Holden Hospital, Carbondale, of cirrhosis of the liver.

**Arthur Paul Wakefield**, Belmont, Mass., Rush Medical College, Chicago, 1904, for twenty-two years medical missionary in China, supervisor of clinics for crippled children for the state department of health, formerly superintendent of the Central Maine Sanatorium, Fairfield, aged 63, died, February 6, of cerebral hemorrhage.

**Hugh Willis Williams** @ Pontiac, Mich., Detroit College of Medicine and Surgery, 1932, medical superintendent of the Oakland County Infirmary, formerly assistant superintendent of the Oakland County Tuberculosis Sanatorium, aged 37, died, February 12, in the Pontiac General Hospital of self-inflicted bullet wounds.

**Barnard John Rothberg**, Hayward, Wis., Universität Basel Medizinische Fakultät, Switzerland, 1937, field physician for the Great Lakes Indian Agency on the Lac Courte Oreilles Reservation, aged 34, died, February 19, in the Hayward Indian Hospital of injuries received in an automobile accident.

**Robert Almon Brehm**, St John's, Newfoundland, Dalhousie University Faculty of Medicine, Halifax, N S, 1898, L R C P London, and M R C S, England, 1900, served during World War I, for many years medical officer of health of St. John's, aged 71, died, February 7, of endocarditis.

**Richard Clyde Sebern**, Fort Dodge, Iowa, State University of Iowa College of Medicine, Iowa City, 1904, member of the Iowa State Medical Society, aged 60, on the staffs of St. Joseph Mercy Hospital and the Lutheran Hospital, where he died, February 18, of coronary thrombosis.

**James Henry Williams**, McKenzie, Tenn., Memphis Hospital Medical College, 1912, member of the Tennessee State Medical Association, chairman of the board of education, aged 59, died, February 1, in the Baptist Memorial Hospital, Memphis, of carcinoma of the adrenal glands.

**Roland A. Willett** & Elmore, Ohio, Bellevue Hospital Medical College, New York, 1888, president of the county board of health for many years, member and president of the board of education of Elmore, at one time mayor, aged 75, died in February of a malignant tumor of the rectum.

**Will Turpin Dowdall**, Paducah, Ky., College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1898, served during World War I, aged 69, on the staff of the Illinois Central Hospital, where he died, February 27, of arteriosclerotic heart disease.

**Richard R. Worthington**, Indianapolis, Ill., Medical College of Ohio, Cincinnati, 1874, member of the Illinois State Medical Society, also a dentist, aged 90, died February 23, in the Lake View Hospital, Danville, of tracheobronchitis and prostatic hypertrophy.

**Elam Eugene Lashbrook** & Estherville, Iowa, State University of Iowa College of Medicine, Iowa City, 1906, formerly secretary of the Emmet County Medical Society, on the staff of the Coleman Hospital, aged 60, died February 26, of cerebral aneurysm.

**Reuben Pennington** & Minneapolis, University of Minnesota Medical School, Minneapolis, 1930, also a dentist, aged 48, on the staff of the Swedish Hospital, where he died, February 25, of coronary thrombosis due to coronary arteriosclerosis.

**Harry Philson Mason**, Wilton Junction, Iowa, College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1900, for many years a member of the county board of education, aged 67, died, February 8, of heart disease.

**Blair Cantrell Hale** & Chattanooga, Tenn., Chattanooga Medical College, 1909, member of the Medical Association of Georgia, past president of the Walker County (Ga.) Medical Society, aged 55, died, February 25, of coronary thrombosis.

**Frank Oscar Ringnell**, Gilman, Hot Springs, Calif., University of Minnesota College of Medicine and Surgery, Minneapolis, 1895, served during World War I, aged 75, died, February 23, in San Jacinto of bronchial asthma.

**George Whitfield Knipe**, Vancouver, B. C., Canada, National University of Ireland, 1906, L.R.C.P., L.R.C.S., Edinburgh, and L.F.P.S., Glasgow, Scotland, 1906, aged 66, died, February 6, of coronary thrombosis.

**Philip Ulmer Reeves**, Birmingham, Ala., University of Georgia Medical Department, Augusta, 1901, member of the Medical Association of the State of Alabama, aged 68, died, February 11, of coronary thrombosis.

**Henry Austin Wood** & Waltham, Mass., Harvard Medical School, Boston, 1883, fellow of the American College of Surgeons, on the staff of the Waltham Hospital, aged 86, died, February 22, of bronchopneumonia.

**Longworth Shuttleworth Anderson**, Irvington, Calif., Cooper Medical College, San Francisco, 1898, aged 63, died, January 13, of hypostatic pneumonia, hypertension, arteriosclerosis and chronic nephritis.

**Charles Sylvester O'Toole**, Anaheim, Calif., Barnes Medical College, St. Louis, 1901, for twenty years physician for St. Catherine Military Academy, aged 72, died, February 5, of heart disease.

**Obadiah Fremont Higbee**, Fowler, Colo., State University of Iowa College of Medicine, Iowa City, 1890, member of the Colorado State Medical Society, aged 81, died, February 21, of chronic bronchitis.

**Sergey Nikolaevich Chernyh**, San Francisco, University of Tomsk Faculty of Medicine, Russia, 1895, aged 71, died, January 16, in the University of California Hospital of carcinoma of the pancreas.

**Mark D. Hill**, Topeka, Kan., Kansas City (Mo.) Hahnemann Medical College, 1910, member of the Kansas Medical Society, aged 56, died, February 24, of coronary occlusion and diabetes mellitus.

**James Emri Pierce**, Bogalusa, La., Memphis (Tenn.) Hospital Medical College, 1902, aged 74, died, February 21, in the Elizabeth Sullivan Memorial Hospital of intestinal obstruction.

**James Emmet Robins**, Buffalo, Ohio, Starling Medical College, Columbus, 1895, formerly county coroner, aged 71, died, February 14, in St. Francis Hospital, Cambridge, of carcinoma.

**John Franklin Sutton**, Bellaire, Ohio, University of Cincinnati College of Medicine, 1920, member of the Ohio State Medical Association, aged 58, died, February 9, of coronary occlusion.

**Asa Earnest Dillman**, Stenben, Wis., Medical University of Ohio, Cincinnati, 1890, member of the State Medical Society of Wisconsin, aged 83, died, February 26, of cardiovascular disease.

**Ernest E. Miller**, David City, Neb., John A. Creighton Medical College, Omaha, 1900, member of the Nebraska State Medical Association, aged 72, died, February 24, of coronary disease.

**Thomas Junior Nunnery**, Granite, Okla., University of Nashville (Tenn.) Medical Department, 1908, aged 55, died, February 20, at Oklahoma City of acute dilatation of the heart.

**John W. Obrist** & Portsmouth, Ohio, Medical College of Ohio, Cincinnati, 1889, on the staff of the Portsmouth General Hospital, aged 78, died, February 26, of hypostatic pneumonia.

**Francis W. Pease**, Keokuk, Iowa, Homeopathic Medical College of Missouri, St. Louis, 1883, aged 83, died, February 9, in the Graham Protestant Hospital of hypostatic pneumonia.

**Joseph Morgan Maurer**, Washington, Pa., Hahnemann Medical College of Philadelphia, 1875, aged 93, died, February 28, in the Allentown (Pa.) State Hospital of arteriosclerosis.

**Thomas H. Wright**, Charlotte, N. C., University of Virginia Department of Medicine, Charlottesville, 1902, aged 61, died, February 26, of myocarditis and cerebral hemorrhage.

**Charles A. Wilson**, Du Bois, Pa., Kentucky School of Medicine, Louisville, 1881, aged 84, died, February 7, in the Maple Avenue Hospital of injuries received in a fall.

**Herman Anthony Glatzmayer**, San Antonio, Texas, Long Island College Hospital, Brooklyn, 1895, aged 79, died, January 31, of arteriosclerosis and heart disease.

**Thomas Tito**, Staten Island, N. Y., Regia Università di Napoli Facoltà di Medicina e Chirurgia, Italy, 1903, aged 72, died, February 26, of cardiac decompensation.

**Charles A. Lyman**, Encinitas, Calif., Lincoln (Neb.) Medical College of Cotner University, 1906, aged 69, died, January 16, in Oceanside of carcinoma of the larynx.

**John Wheeler Clark**, Cartersville, Mo., Barnes Medical College, St. Louis, 1895, aged 68, died, February 22, of acute follicular tonsillitis and chronic myocarditis.

**Cornelius Hood Williams**, Middletown, Ohio, Kentucky School of Medicine, Louisville, 1889, aged 82, died, January 30, of cerebral hemorrhage.

**John E. Bayliff**, Umopoli, Ohio, Pulte Medical College, Cincinnati, 1887, aged 80, died, February 28, of arteriosclerosis and heart disease.

#### DIED IN MILITARY SERVICE

**Collum Anthony Miles**, Wilmerding, Pa., Hahnemann Medical College and Hospital of Philadelphia, 1937, member of the Medical Society of the State of Pennsylvania, was called to active duty as a first lieutenant in the medical reserve corps of the U. S. Army, March 3, 1941, aged 30, was shot and killed while aboard ship in Hawaii, March 12, when a sentry accidentally discharged his gun.

**Frederick Page Boswell** & Montgomery, Ala., University of Alabama School of Medicine, 1913, member of the Radiological Society of North America, Inc., and the American College of Radiology, lieutenant in the medical corps of the Alabama National Guard from 1913 to 1915, served in the U. S. Navy during World War I, reported to active duty on Dec. 29, 1941, with the rank of lieutenant commander, medical corps, voluntary specialist, U. S. Naval Reserve, roentgenologist to St. Margaret's Hospital, aged 53, died, March 10, in the U. S. Naval Hospital, Corpus Christi, Texas.

## Bureau of Investigation

### SOME MISCELLANEOUS MEDICAL FRAUDS

#### A Variety of Schemes Debarred from the Mails

Fraud orders issued by the Post Office Department have frequently been the subject of extensive articles by the Bureau of Investigation in these pages of THE JOURNAL. Following are brief abstracts of some fraud orders not dealt with previously.

**Frederick P. Walker Company**—This was the trade style used by Frederick P. Walker of Yonkers, N. Y., in selling his Sanocrin or Sanocrin Pomade as an alleged cure for dandruff, eczema or itching of the scalp and falling hair and also as a hair grower and hair color restorer. Originally Walker had operated under the names Sincrin Products Company and Sanocrin Hair Products Company and when the Post Office Department first indicated that it would commence action against him for operating a mail order fraud he signed an affidavit on April 2, 1940 in which he promised the Department that he would abandon the scheme. Instead it developed that he continued in business but adopted the new name Frederick P. Walker Company. When the Post Office again notified him to show cause on March 20, 1941 why a fraud order should not finally be issued against him he replied that he was no longer in business because of his inability to obtain his preparation from Sweden and had been returning his customers' remittances. He asked permission to file a new affidavit this time to authorize the postmaster at Yonkers to return to the senders all mail addressed to him and stamp it "Out of Business." Because his previous affidavit had proved false his request was refused. When his case came to the hearing Walker neither appeared nor sent a representative. Testimony for the government was however presented by the Post Office inspectors who had investigated the business under its two names and also by an expert medical witness and a government chemist. The chemist testified that his analysis of the product revealed that it consisted of 51 per cent of unsaponifiable material such as mineral oil and wax, 40 per cent of fats, 18 per cent by weight of volatile oils and 0.14 per cent of sulfur. The expert medical witness testified that such a mixture would have a mild irritant and antiseptic action when applied but that aside from a temporary effect in cases of dandruff and itching scalp the product would have no therapeutic value and would not cause hair to grow on the heads of bald persons as represented nor would it restore gray hair to its original color. In fact it was pointed out that Frederick P. Walker, when interviewed by one of the Post Office inspectors in September 1939, was himself observed to be a person whose hair consisted of a few strands which were combed straight back over the head. His explanation was that he had used his preparation at one time but had received no benefit because he had not continued using it. All things considered his business was declared by the Post Office to be a scheme for obtaining money unlawfully and on April 14, 1941 a fraud order was issued against the Frederick P. Walker Company and its officers and agents.

**Gold Band Eye Balm Company**—This concern did business from Jacksonville, Fla., selling through the mails its Gold Band Eye Balm by representations which the Post Office declared to be false and fraudulent. Among these were that when used as directed the preparation would enable the blind to see, would restore to normal the eyesight of persons suffering from sight deficiencies and enable persons wearing eye glasses for eyesight defects to discard the further use of such glasses in from 4 to 8 weeks that it would accomplish these results regardless of what ever treatments had previously been employed and would produce for any user the same or similar results as were described in testimonials played up in the advertisements. The Post Office investigation revealed that the concern had been incorporated for \$15,000 in June 1932 and that the stock was owned by an A. I. G. Richardson of Monticello, Fla., and an Edward J. W. Day of Jacksonville, Fla. Day was found to be the manager and sole operator of the enterprise. To inquire he sent a small pamphlet entitled "The World's Greatest Relief for Eye Trouble Cold Band Eye Balm." On the front cover of this were these claims: "Clears and Strengthens eyes from 5 to 8 months. You may lay aside your glasses from 4 to 8 weeks by following directions. Inside it was stated: 'People who were nearly blind have had their sight brought back by Gold Band Eye Balm and alleged testimonials given therein contained such statements as: 'It made the blind to see and many prescriptions from the best oculists proved inefficient to bring relief but the eye balm prescribed by the G. B. E. B. Co. has done more to remove the inflammation and give a clear vision than any I have used.' According to the Post Office inspector who investigated this case Mr. Day informed him that he began to market this product as a result of a vision which came to him in his sleep from God and that the balm was made from a root. Government chemists reported that the preparation consisted of water with the usual amount of minerals ordinarily found in drinking water. At the hearing of the case an expert medical witness for the government testified that eyesight defects are due to many causes including anatomical changes in the eyeball and that certain diseases have a deleterious effect on the sight. He further pointed out that cataracts frequently are present in deficiencies of sight that many other factors enter into the impairment of vision that in ordinary cases the wearing of properly fitted eye glasses usually affords proper vision to the wearers and that certain kinds of eye troubles are incurable by any known medicinal treatment including the one in question. It was further brought out that cataracts require the intervention of surgery. The evidence showed also that Day's nostrum would have no more effect than the use

of ordinary drinking water in the eye and that it certainly would not enable persons who wear glasses to discard them in from 4 to 8 weeks as claimed or prove effective in the restoration of eyesight deficiencies when all other treatments and measures failed. Mr. Day put up no defense in this case and sent no one to represent him although previously his attorney had filed a general denial of the charges with the Post Office Department. On Jan. 7, 1941 a fraud order was issued against the Gold Band Eye Balm Company and its officers and agents.

**Schmedding Laboratories**—This Los Angeles concern run by a Joseph Schmedding and an M. E. Anderson sold by mail Schmedding's Home Treatment, Schmedding's Mouth Wash and Schmedding's Tooth Powder making representations that the Post Office Department declared to be false and fraudulent. Among these were that the products were a truly amazing discovery which would prevent and overcome pyorrhea, trench mouth and similar conditions and that persons using them at home would obtain the same beneficial results in these disorders as are offered by dentists in their offices. To those who answered the advertisements the concern sent the three products mentioned. The 'Home Treatment' government chemists reported was a light brown liquid which contained 0.5 Gm. of phenol per hundred cubic centimeters, the remainder being essentially glycerin and water with a small amount of tannic acid. It was to be swabbed on the affected areas with cotton several times daily. The Concentrated Mouth Wash the government chemists testified was an olive green liquid containing 0.122 Gm. of iodine per hundred cubic centimeters, 26.7 Gm. of nonvolatile matter chiefly glycerin, 0.2 per cent of volatile oils (wintergreen and peppermint) water and a small amount of tannic acid. This mixture was to be used as a gargle or mouth wash after each meal and at bedtime. The tooth powder according to the government chemist contained 46 per cent of common salt with 26 per cent of calcium carbonate, 13 per cent each of sodium perborate and soap and unnamed amounts of saccharin, methyl salicylate and oil of peppermint. At the hearing of this case an expert medical witness for the government testified regarding the cures and scientific treatment of pyorrhea and showed that the Schmedding products would have practically no remedial effect on this condition. The defendants sent no representative to the hearing. On March 7, 1941 a fraud order was issued against the Schmedding Laboratories, Joseph Schmedding, M. E. Anderson and their officers and agents.

**Vita Lux Company Technical Equipment Company Nu Vita Company and D. F. Starkweather**—Under these names one Irving Schumaker and a person named Nelson sold through the mails a device called the Nu Vita (also known as the Vita Lux) for prostatic disorders and some other conditions. It was represented that the Nu Vita device was a perfect method for massaging the prostate gland and achieved complete emptying thereof in a manner superior to and more effective than digital massage technique employed by physicians that it would remove the cause of and permanently cure hemorrhoid and pelvic disorders including those affecting the rectum, bladder, uterus, ovaries, tubes and other organs of the pelvic cavity that it would overcome constipation and soon establish regular and normal bowel action and could be used with absolute safety by persons afflicted with any of the disorders named. The device which sold for \$15 was represented by the Post Office to consist simply of a hard round rubber rod or dilator 5½ inches long for insertion in the rectum or pelvic cavity. The dilator was provided with an electric cord to be plugged into the house current together with a switch for turning the electricity on and off. In September 1940 the Post Office Department notified Schumaker and Nelson to show cause on October 21 why a fraud order should not be issued against them and the trade style they were using but they neither put in an appearance at the hearing nor sent any representative. For the government there appeared an expert medical witness who testified that scientific experiments made on the device disclosed that after fifteen minutes of heating the Nu Vita attained a temperature of 109 degrees Fahrenheit, much too hot to be tolerated by the tissues being treated and further that there was no way to regulate the temperature of this mechanism except by turning off the electric current completely. He further testified that some prostatic disorders are based on causes which a device of this kind could not possibly affect nor would it be a safe means of self treatment particularly since certain serious conditions such as cancer frequently accompany prostatic disorder. It is worth noting that the defendants had published a testimonial alleged to come from a purported physician whom the Post Office was unable to identify as a Doctor of Medicine. Also there apparently was no such person as D. F. Starkweather who was represented as president of the Nu Vita Company. On Nov. 25, 1940 the Post Office Department issued a fraud order against the names Vita Lux Company, Technical Equipment Company, Nu Vita Company, D. F. Starkweather, president and their officers and agents.

**You and I Trading Shop Dunbar Company Ltd. The Heather Journal The Scotch Heather Journal The Scotch Heather Herb Company and Indian Mailing Service**—These were names used by a John Dunbar and a Mrs. Mary W. Titus of Bradford, Pa., in selling Grey Eagle Pile Ointment through the mails as a remedy for various rectal disorders including even tumors, cancers and ulcers. Neither of the defendants appeared at the hearing which the Post Office Department held on Nov. 13, 1940. At that time a government chemist testified that the nostrum consisted of echinacea, wild alum and indigo in a petrolatum base. An expert medical witness testified for the government that these ingredients are ordinary drugs whose actions and limitations are well known to the medical profession and that although the mixture in question might offer some slight temporary relief in painful symptoms it would have no other effect on the condition named. Further it was brought out that on the previous May 6 Mrs. Titus had signed an affidavit with the Post Office agreeing to discontinue the sale of Grey Eagle Pile Ointment and some other nostrums but had not kept her promise. Accordingly on Nov. 26, 1940 a fraud order was issued against all the company names in question.

### THE DOCTOR'S PART IN BUILDING MORALE SEEN AS STEP TO TOTAL VICTORY

To the Editor.—In *THE JOURNAL*, February 21, page 624, an editorial on national morale contains the statement "A nation with good morale is one with enthusiasm, confidence, teamwork and endurance. Many people like to think that morale is just common sense. However, the building of morale involves psychologic principles and studies of public opinion far beyond anything we have yet attempted in this country. The process of morale building is closely allied to the processes of education. That morale is best built which is built from thousands of small centers in a nation rather than that based on the prestige and power of a few national figures. The chief danger points in the home front are obviously the bickering and arguments which tend to split a nation into small groups, many organized specifically to question national decisions."

The American doctor, with his insight into human nature and knowing the confidence and trust of the average American, has a unique opportunity in thousands of centers throughout the nation to create sound national morale. A star columnist of the national press in blitzed Britain has said that "morale is the secret weapon that will win the war." Particularly in time of war the creation of sound national morale is essential for sound health and for the success of the national effort. On morale depends the efficiency, enthusiasm and staying power of the soldiers on the production lines. And we are well aware of the psychologic effect that a high civilian morale has on the soldiers on the firing lines.

In this situation every doctor has the opportunity to be a statesman. A statesman is a citizen who sees the effect of bickering and division in home and community on national welfare and prescribes the answer. Every day we are entering homes where disputes and bickerings, "the main point of danger in the home front," characterize the life of the family and undermine the spirit which is fundamental to the health and morale of a nation at war. Friction in homes produces leaky valves in the fighting heart of the nation. It creates waste of energy, money, time, emotion and brainpower.

In a time of total war it becomes necessary to write a corollary to the Hippocratic Oath that not only will we "do no evil on entering a home" but we will leave the cure for the evil of division and bitterness we may find there. As we create homes which have learned how to meet division and to pull together, the family will carry this spirit into the life of the community and build the foundation necessary for sound health and hysteria proof, greed proof morale.

Every doctor can work out his own method for achieving morale in the homes he reaches. But there are two simple principles which can be left on a prescription pad to be filled by the family. They always work.

- 1 The power of honest apology, which is a specific for division and bitterness and is the road to honest peace.
- 2 The settlement of differences in the life of the family and community on the basis of what's right, not who's right.

This is not only good therapy as a background to treatment of the patient's ills but in war time is an essential national service in creating a united, purposeful, confident and enthusiastic people. It will save human energy for peak production. True loyalty to medicine takes us beyond our personal relationship to it. It takes our thought and energy and devotion to the profession as a whole and to its destiny in this country.

Already in many areas of American life the prescription of honest apology has reduced individual tensions, created industrial cooperation, helped unite the nation and so sustain general morale.

Failure of the medical profession to render this service to the nation makes easier the carrying out of the enemy's announced strategy for this continent to divide and conquer.

As we accept responsibility for the morale of the nation we become statesman-doctors, sources of unity and strength for the nation producing the physical, mental and moral fitness necessary for an all out effort.

By now it is obvious that, if medicine is to have the air of freedom in which alone it can thrive and maintain its advances, we must create now in this nation the superforce of an unconquerable spirit which will not only win the war but secure the peace and build a new world.

Henry Ford Hospital, Detroit

### FALLING DROP TECHNICS

To the Editor.—In *THE JOURNAL*, January 17, page 248, there appears a communication from H. G. Barbour and S. F. Hamilton criticizing falling drop technic other than the one which they developed.

My calculations and procedure (*J. Clin. Investigation* 17:369, 373 [July] 1938, *J. Lab. & Clin. Med.* 26:1681 [July] 1941) were based on Stokes's law for the fall of a sphere through a viscous medium, which was proved in 1851, though no author until I myself applied Stokes's great contribution, many contributed to the evolution of this determination.

The application of Stokes's law eliminated Barbour and Hamilton's "vagaries" of oils "under different conditions of temperature." It also greatly simplified the calculations and eliminated the complex logarithmic expression and the admittedly unsatisfactory nomogram required in their technic. Barbour and Hamilton themselves point out (*J. Biol. Chem.* 69:639 [Aug.] 1926) that expansion and contraction of the paper due to atmospheric changes are "a real drawback" to the accurate use of nomograms.

After correspondence with the Eastman Kodak Company, Barbour and Hamilton decided on a xylene-bromobenzene medium. Later Guthrie and Kruse found that methyl salicylate and liquid petrolatum could be used. Since the latter has a much higher boiling point and evaporation is minimal, the necessity for the constant use of standards is eliminated. Such a mixture prepared four years ago and tested repeatedly has shown no detectable change. Furthermore it is obvious that this oily preparation will maintain its physical properties much longer than the aqueous solutions of potassium sulfate used by Barbour and Hamilton for standards, no matter how well these aqueous solutions are protected by layers of oil.

These critics offer no proof for their statement that decrease in the length of fall of the drop significantly affects sensitivity. On the other hand, Hochberg and La Mer recently increased the sensitivity of Barbour and Hamilton's method by various changes, one of which was shortening the length of fall.

For reasons stated clearly by Moore and Van Slyke (*J. Clin. Investigation* 8:341 [April] 1930), few people used the method of Barbour and Hamilton from 1924, when it was first described, until the last several years. Moore and Van Slyke found that in this method the precautions required for maintaining standards and reading the nomogram made the chances of error greater than in the older pycnometric method.

Barbour and Hamilton claim that they first pointed out the chief clinical applications of the falling drop principle. Today one of its most widespread and useful clinical applications is for the estimation of serum protein concentration. They do not describe the usefulness of their method for this purpose in any of their writings. In 1930, three years after their last publication on this subject, the linear relationship which exists between specific gravity and plasma protein concentration was

first demonstrated by Moore and Van Slyke, who used the older pycnometric method for reasons already stated

In June 1937 I submitted for publication the first report of a falling drop technique for the determination of serum protein concentration which is rapid, accurate and simple enough for routine clinical purposes. The method I described has been proved by satisfactory performance in laboratories all over the country, and the results have been verified in detail by Shumrin and Jeghers (*New England J Med* 222:335 [Feb 29] 1940)

#### ADVANTAGES OF BENZOYL PEROXIDE OVER ZINC PEROXIDE OR SULFONAMIDES IN TREATING WOUNDS OR BURNS

To the Editors —Editorial comment recently appeared (*THE JOURNAL*, March 21, p 981) on zinc peroxide and sulfonamide derivatives in the treatment of gas gangrene. This called attention to the work of F L Melency (*Ann Surg* 101:997 [April] 1935, 109:881 [June] 1939, *U S Nav M Bull* 40:53 [Jan] 1942) in showing the effectiveness of a 40 per cent watery suspension of zinc peroxide in preventing gas gangrene when applied to wounds infected with gas producing organisms. This has been confirmed by G B Reed and J H Orr (*War Med* 2:79 [Jan] 1942) and has been extended by them to include the use of sulfathiazole. They state that sulfathiazole is superior to other sulfonamide derivatives for this purpose. The latter opinion is at variance with the experience of surgeons at Pearl Harbor, who feel that there is less foreign body reaction in the wound when dusted with sulfanilamide than when sulfathiazole is used.

With regard to the recommendation for the use of zinc peroxide, it may be recalled that long ago A S Loevenhart (*Therap Monatsh* 12:426, 1905) suggested benzoyl peroxide as an effective nonirritating oxidizing antiseptic. R A Lyon and T E Reynolds (*Proc Soc Exper Biol & Med* 27:122 [Nov] 1929) demonstrated the relative effectiveness of benzoyl peroxide over other agents in promoting wound healing.

There is evidence that the sulfonamides inhibit wound healing and irritate tissue (Taylor, F W. *The Misuse of Sulfonamide Compounds*, *THE JOURNAL*, March 21, p 959). This is to be expected if the mechanism of action of these chemotherapeutic agents is to inhibit growth. This inhibition may occur by interfering with such growth promoting substances as para-aminobenzoic acid, as proposed by D D Woods (*Brit J Exper Path* 21:74 [April] 1940) and abundantly confirmed (McIlwain, H, *ibid* 22:148 [June] 1941; Harris, J S, and Kolm, H I. *J Pharmacol & Exper Therap* 73:343 [Dec] 1941; Rantz, L A. *Proc Soc Exper Biol & Med* 49:137 [Feb] 1942). Sulfonamides, on the other hand, may block at certain concentrations enzyme systems necessary for growth, as proposed by F H Johnson (*Science* 95:104 [Jan 23] 1942). In either case, clinical experience seems to substantiate the expectation that sulfonamides delay wound healing. However, many clinicians who cannot resist the notion that the sulfonamide drugs are miracle mongers tend to protest, sometimes with undue emphasis, that they have found no evidence that the sulfonamides actually do interfere with wound healing. Of course, anything that reduces infection in a wound will help the wound to heal. But the sulfonamides in a sterile wound may reduce the rate of healing.

Benzoyl peroxide has advantages over the sulfonamides for direct dusting into wounds to inhibit gas forming organisms in that there is evidence to show that it promotes wound

healing, in addition to exerting an effective antiseptic action without local irritation or injury. It has an advantage over zinc peroxide in that it is locally anesthetic. Benzoyl peroxide may be dusted directly into the wounds or be applied in a water suspension in an appropriate concentration or in petrolatum at a concentration of 10 per cent. In a concentration of 5 to 10 per cent it might be incorporated in liquid petrolatum or molten paraffin wax (as proposed by Dr Ralph Pendleton) for spraying on burned areas. The advantages of benzoyl peroxide for local application to wounds, abrasions or burns are (1) effective long lasting, oxidizing antiseptics, particularly against gas producing organisms, (2) lack of local injurious or irritating effects, (3) lack of penetration into tissue with no protein precipitation and thus with no tendency to interfere with healing, (4) tendency as shown by direct experimentation to promote healing and (5) local anesthetic action to relieve pain, local irritation, itching and other local discomfort.

These properties of benzoyl peroxide suggest its effectiveness for use in handling war gas injuries, with particular reference to lesions of the skin or mucous membranes developing from mustard gas or lewisite.

#### PRESERVATION OF LIQUID PLASMA BY SULFONAMIDE DERIVATIVES

To the Editor —In the February 14 issue of *THE JOURNAL* I published a paper on the preservation of liquid plasma by the use of sulfonamide derivatives. The report was based on hundreds of experiments employing numerous species of bacteria encountered as contaminants in stored plasma. In no instance did I demonstrate growth of bacteria in plasma containing 200 mg per hundred cubic centimeters (0.2 per cent) of sodium sulfathiazole, nor did plasma containing the compound become grossly contaminated when exposed to air contamination for long periods of time.

In *THE JOURNAL* of March 28, Heath and Province published their results on a small series of experiments carried out under unusual conditions in that they do not represent actual working conditions and made broad conclusions which do not discredit my own but tend to cast doubt on the efficacy of the sulfonamide method. In their experiments they used only five species of bacteria, none of which are commonly found in contaminated plasma. They completely ignored the common contaminants such as the aerobic spore formers.

The experimental temperature of storage was 5 C and 37 C. At the former temperature no growth was obtained in any tubes including the controls because of the improper choice of bacteria. No explanation is made as to why 37 C was chosen as an experimental temperature, since plasma is obviously not stored in an incubator. However, in spite of these conditions their results show complete bacteriostasis with some of the drugs used in a 0.2 per cent concentration, together with a bactericidal action which confirms my results in part.

Since their conclusions are based on these limited observations, under conditions not applicable from a practical standpoint and in spite of evidence to the contrary in their own data, I feel that their statements which tend to cast doubt on the value of the compounds as bacteriostatic agents in plasma are not justified.

I have concluded on the basis of much more extensive laboratory investigations and observations on actual routine clinical use in outstanding hospitals that the sulfonamide derivatives as preservatives in plasma are the answer to the vexing problem of bacterial contamination.

### MEDICOLEGAL ABSTRACTS

**Paternity Compulsory Blood Grouping Tests Violative of Right of Privacy**—The plaintiff filed a bill for divorce against his wife on the ground of adultery, alleging that he was not the father of a child then recently born to her. A New Jersey law provides, among other things, that whenever it shall be relevant in a civil action to determine the parentage of any child the courts may direct that any party to the action and the person whose parentage or identity is involved submit to one or more blood grouping tests. The plaintiff sought to invoke the provisions of this law and asked the court to order that blood grouping tests be made of him, his wife and the child in order to determine the child's parentage. The wife contested the application, contending on behalf of herself and for the child, that an order for the making of blood grouping tests would constitute an invasion of "then natural and constitutional privileges."

Whether a compulsory order for the taking of blood grouping tests is in violation of the privilege against self incrimination, pointed out the court of chancery of New Jersey, has been debated without any unanimity of opinion. The subject has been discussed in law review articles on the basis of analogic reasoning, but not one of these articles has referred to any controlling decisions. The court then discussed in detail cases from other jurisdictions in which this issue has been involved, including the case of *State v. Height*, 117 Iowa 650, 91 N. W. 935, 59 L. R. A. 437, 94 Am. St. Rep. 323. In that case, characterized by the court as "the leading case" the defendant was accused of statutory rape of a child aged 10 years. In order to

prove his guilt the state offered in evidence the testimony of a physician who had made a physical examination of the accused against his will to determine whether he was afflicted with a venereal disease similar to that with which the prosecutrix had been infected. The court in the Iowa case held that such an examination by a physician under the direction of the prosecutor constituted an unlawful search and seizure, a denial of the privilege against self incrimination and a violation of due process. The court in the present case also referred to a number of discussions in legal periodicals in which the view has been taken that blood tests and physical examinations constitute real evidence not within the scope of the immunity against self incrimination. On historical precedent these articles argue that the privilege against self incrimination applies only to testimonial evidence. While leaning to the general philosophy underlying the decision in the *Height* case the court here based its determination on another New Jersey law which expressly exempts a husband and wife in an action for divorce on the grounds of adultery from being compelled to give evidence for the other, except to prove the fact of marriage. The comprehensive word "evidence," the court pointed out, was used in this law, and is a broad, embracing term including all classes of proof, testimonial or otherwise. As definitive of the term "evidence," the court quoted from 22 C. J. 66 as follows:

While the term "testimony" is frequently employed as equivalent, in legal effect to "evidence" such use is inaccurate, for the terms are not synonymous. "Evidence" is the broader term and includes all testimony but "testimony" is accurately used to designate only a particular kind or species of evidence, namely, that which comes to the tribunal through living witnesses speaking, under oath in the presence of the tribunal.

The provisions of the law exempting a husband and wife from being compelled to give evidence for the other, under the circumstances indicated, was in effect, the court said a reenactment in comprehensive language of the common law immunity against self incrimination as it applies particularly to suits for divorce on the ground of adultery. Furthermore, the court pointed out, it could not reasonably be held that the legislature, in authorizing the court to order the making of blood grouping tests, intended to repeal by implication a statute of such long standing, expressive of such an ancient and universally approved personal privilege.

To the court it seems strange that in none of the reported cases involving the issue here presented has the constitutional right to personal privacy and security been raised and debated. The right of privacy, the court said has its foundation in the instincts of nature. It is recognized intuitively, consciousness being the witness to prove its existence. Any person of normal intellect recognizes at once that as to each individual member of society there are matters private and matters public. Each individual instinctively resents an encroachment by the public on his private rights. The right of privacy in matters purely private is derived from natural law. To subject a person against his will to a blood test the court said, is an assault and battery and clearly an invasion of his personal privacy. It involves the sticking of a surgical needle into his body. Perhaps the operation is harmless in the great majority of cases, although the risk of infection is always present. But if it is admitted that such an encroachment on the personal immunity of an individual is authorized, where, the court questioned, in principle can we stop? If medical discovery in the future evolves a technique whereby the truth may infallibly be secured from a witness by trepanning his skull and testing the functions of the brain beneath, no one in the opinion of the court, would, contend that the witness could be forced against his will to undergo such a major operation at the imminent risk of his life, in order to secure evidence in a suit between private parties. How then can he be forced to undergo a less dangerous operation, and at what point shall the line be drawn? In the opinion of the court, it is not the degree of risk to life, health or happiness which is the determinative factor but the fact of the invasion of the constitutional right to personal privacy. This was not a case, the court continued, in which the public interest required the making of the tests. Possibly there may be civil cases in which it could be argued that the

tests could be justified under the police power for example a proceeding for custody where a substitution has inadvertently been made in a maternity hospital. But public policy does not favor divorce. It regards the family as a social unit and does not encourage the annulment or dissolution of that relationship. It recognizes, with the strongest presumption, the legitimacy of every child born in wedlock.

The granting of the application made in this case concluded the court would constitute an unconstitutional invasion of the right of personal privacy of the defendant and of the child. The application was therefore denied.—*Bednarik v. Bednarik* 16 1 (2d) 80 (N. J., 1940)

**Malpractice Roentgen Treatments, Accrual of Right of Action**—In January 1935 the plaintiff consulted the defendant physician about a tumorous growth in her abdomen from which she was then suffering. The defendant advised the plaintiff, according to the allegations of her complaint, that he specialized in roentgenology and that he could guarantee to cure her with ten roentgen treatments. The plaintiff's complaint then alleged that she received her first roentgen treatment on Jan. 12, 1935 and the last one on Feb. 18, 1936, by which time she had taken ninety treatments instead of ten as originally contemplated. The defendant then gave her other types of treatment until May 1939. In a subsequent suit for malpractice against the defendant filed on Nov. 16, 1939 the plaintiff claimed serious injury due to the excessive number of roentgen treatments. The defendant's demurrer to the complaint was sustained and the plaintiff appealed to the Supreme Court of Kansas.

The chief ground for sustaining the defendant's demurrer was that the action was barred by the two year statute of limitations. Although the basis for the plaintiff's cause of action was that the defendant had been guilty of negligence in giving her ninety roentgen treatments instead of ten as he "had promised, advised and agreed," she argued that the rendering of other professional services until May 1939, within two years of which the suit was filed, stayed the running of the statute until that time. The Supreme Court held that the two years allowed by the statute of limitations in which to commence an action for damages for malpractice begins to run from the time the wrongful act is committed. Since the roentgen treatments ceased in February 1936 the court held that an action for damages based thereon should have been commenced within two years of that date and was barred since not filed until November 1939. The judgment of the trial court, sustaining the demurrer to the complaint, was therefore affirmed.—*Becker v. Floersch* 110 P. (2d) 752 (Kan., 1941)

**Dental Practice Act, Validity of Disciplinary Procedure**—Written complaints were filed against the plaintiff dentists charging them with professional misconduct. Prior to a hearing, the plaintiffs filed suits for injunctions to restrain the Department of Registration and Education of the State of Illinois and its dental examining committee from proceeding on the written charges. The trial court refused to grant the injunctions and the plaintiffs appealed to the Supreme Court of Illinois.

The plaintiffs contended that the procedure in the dental practice act for the institution and hearing of complaints against licensed dentists was wanting in due process of law. The act authorizes the director of the Department of Registration and Education to revoke the license of a dentist on the written order of the dental examination committee. If the director disagrees with the conclusions or recommendations of the committee he may remand the case to the same committee or to a new one. The complaint in these cases were filed by a paid employee of the department at the request of the director. Therefore, the plaintiffs argued, the director can resubmit his own case to one committee after another until a recommendation satisfactory to himself has been returned and the director thereby becomes the accuser, prosecutor and judge. The Supreme Court held, however, that there was nothing in the plaintiffs' cases which indicated the least degree of prejudice by the dental examining committee even though the charges were made by an employee of the department. The plaintiffs also argued that the act

deprived them of due process of law because the director's order of revocation was self-executing and no stay order could be issued pending an appeal except on ten days' notice and a hearing. They said that dentists would be caused irreparable damage and injury by not being able to practice their profession for ten days. The Supreme Court refused to pass on the contention, however, because that provision of the act had not been invoked against the plaintiffs and they were consequently not injured thereby. The court saying: "This court will not consider the constitutionality of a statutory provision where the party complaining has not been affected thereby nor in any way aggrieved by its operation." Finally, the plaintiffs argued that the proceedings were violative of due process because the written charges were not sufficiently definite and specific. The Supreme Court said that the charges in a proceeding of this nature are not required to be drawn with the "refinements, niceties and subtleties of pleadings in courts of record." It is sufficient if the plaintiffs were fairly and reasonably apprised of the acts with which they were charged so that they could properly prepare their defense. The charges against the plaintiffs alleged specific acts of misconduct in violation of the dental practice act. The dates of the acts, the place they occurred and the manner in which the act was violated were also stated. The court concluded that a mere reading of the complaints demonstrated that they were sufficient to inform the plaintiffs of the nature of their unlawful acts. The injunctions were therefore properly denied. Judgments for the defendants were affirmed.—*Tarr v. Hallahan et al. Marshack v. Same* 30 N. L. (2d) 421 (Ill., 1940)

**Malpractice Injury Attributed to Radium Treatment of Facial Blemish, Suit Delayed Twelve Years**—In 1922, when the plaintiff was 4 years old a pinkish area developed on her forehead which was diagnosed as a birthmark. The defendant, a dermatologist, attempted to remove the blemish with radium. At the time that treatment was instituted the pink mark started on the lower part of the forehead just above the nose and extended upward about 1 inch. It was about 1½ inch wide. During the next year or year and a half the condition spread upward, causing a strip of the patient's hair to fall out, so that there was left a bald path about an inch wide, extending back to the crown of her head. The frontal bones were affected, causing a depression in her forehead. Twelve years later in 1934, the patient sued the defendant. At the close of the plaintiff's case the trial court, on motion of the defendant, withdrew the case from the jury and gave judgment for the defendant. On appeal to the Supreme Court of Ohio, the judgment for the defendant was reversed and the cause remanded for a new trial. (12 N. E. (2d) 283, J. A. M. A. 111 652 (Aug. 13) 1938.) On a second trial, a judgment was entered for the plaintiff in the amount of \$10,000, and the defendant appealed to the court of appeals of Ohio, Cuyahoga County.

The plaintiff first contended that the defendant was negligent in improperly diagnosing her condition as a birthmark when in fact it was scleroderma, which apparently was the final diagnosis. The evidence showed, however, that before the plaintiff was taken to the defendant she had been examined by two other physicians, each of whom had likewise diagnosed her condition as a birthmark. Furthermore, the court pointed out, the evidence was overwhelming, if not uncontradicted, that a birthmark and a discoloration resulting from scleroderma are indistinguishable in appearance, or by any other known test, and differ only in the manner of their development. The court of appeals was of the opinion that the record disclosed no evidence of negligence in diagnosis. In addition, the record was clear that no harm resulted to the plaintiff because of the initial diagnosis, for there was no evidence that the application of radium to either a birthmark or scleroderma would have had any harmful results unless the treatments were excessive or too frequent.

The plaintiff next contended that the second treatment given to her was in fact applied too soon after the first. At the second trial the plaintiff's father, mother and grandmother stated that the first time the defendant saw the plaintiff was in the fall of 1922 and that the second visit was two weeks later. The evidence showed, however, that the father and the grandmother

had prior to the second trial, sworn that the first visit occurred in the spring of 1922. The court of appeals felt that the explanation given by the witnesses to justify this variance in their testimony was unsatisfactory. The defendant, on the other hand, testified that the two visits occurred on July 21, 1922, and Oct. 20, 1922, almost three months apart, his recollection being refreshed by the diary record which he kept. Furthermore, there was considerable evidence to the effect that applications of radium at the dosage used, two weeks apart, would have been in accordance with the standards of good practice in treating both scleroderma and a birthmark. Whether it would have effected a cure was dependent on circumstances, continued the court but it was clear that no harm would result to a birthmark and that if the condition was scleroderma it would progress just as the condition of the plaintiff did with the appearance manifested in her case.

The plaintiff's mother testified that she concluded in 1923 that the defendant had burned her daughter and accused him of it. This testimony evoked the following comment from the court:

While the time of limitations would not run against the plaintiff during her minority we are nevertheless of the opinion that a just appraisal of the testimony of her custodians requires the court to consider the fact that with full knowledge of the facts they delayed filing this action for twelve years. Her custodians were adults. They had the power to institute this action during all those years. They knew the facts. Why such delay? Appraised persons ordinarily do not postpone asserting rights so long. We consider that in reaching our conclusion.

The court concluded that the judgment was manifestly against the weight of the evidence. Too, counsel for the plaintiff in the opinion of the court, was guilty of such prejudicial conduct as would invalidate any trial. By reference to medical textbooks not in evidence, the court said, and by unfounded assertions that large sums of money had been spent in the defense and by other unfounded inferences, an atmosphere must have been created in which it was impossible for the jury to have distinguished between actual evidence submitted to them for analysis and these non-evidential assertions and innuendoes. Accordingly the judgment for the plaintiff was reversed and the cause again remanded to the trial court for further proceedings according to law.—*Hibach v. Cole*, 31 N. L. (2d) 736 (Ohio, 1930).

Texas State Medical Association of, Houston, May 11-14 Dr. Holman Taylor, 1404 West El Paso St., Fort Worth, Secretary

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

### American Journal of Physiology, Baltimore

135 523-798 (Feb) 1942 Partial Index

- Sensitization of Submaxillary Gland to Acetylcholine by Section of Chorda Tympani J H Wills Boston—p 523
- Rate of Emptying of Rat's Stomach Following Intragastric Administration of Glucose Solutions H B Pierce Lorraine F Haegge and P T Fenton—p 526
- Changes in Balance of Respiratory Drives Resulting from Open Pneumothorax R Geell and C Moyer Ann Arbor, Mich—p 539
- Experimental Production of Hemophilia-like Condition in Heparinized Mice A L Copley and J J Lahic Kansas City, Kan—p 547
- Relation of Heat Production to Water Metabolism During Administration of Synthetic Thyroxine J M Bruhn, University Ala—p 572
- Metabolism of Calcium and Phosphorus as Influenced by Various Activated Sterols E W McChesney and F Messer Rensselaer N Y—p 577
- Relative Increase in Chloride Excretion in Dog After Graduated Doses of Mercurial Diuretics C C Roby and C Pfeiffer Chicago—p 591
- Hemoglobin Radioactive Iron Liberated by Erythrocyte Destruction (Acetylphenylhydrazine) Promptly Reutilized to Form New Hemoglobin W O Cruz Rio de Janeiro Brazil, P F Hahn and W F Bale, Rochester, N Y—p 595
- Radioactive Iron Used to Study Red Blood Cells Over Long Periods: Constancy of Total Blood Volume in Dog P F Hahn, W F Bale and W M Balfour, Rochester N Y—p 600
- Gastric Inhibition Caused by Amino Acids in Small Intestine J E Thomas Philadelphia—p 609
- Fundamental Differences in Excitability of Somatic and Autonomic Centers in Response to Anoxia E Gellhorn, R Cortell and H B Carlson Chicago—p 641
- Cortical Responses to Electric Stimulation A Rosenbluth and W B Cannon Boston—p 690
- Calorigenic Effect Produced by Various Mixtures of Foodstuffs G C Ring Columbus Ohio—p 742
- Pathway of Sympathetic Nerves to Ciliary Muscles in Eye J B Mohny M W Morgan Jr J M D Olmsted and I H Wagman, Berkeley, Calif—p 759
- Transmission Fatigue and Contraction Fatigue E C del Pozo Boston—p 763
- Increased Dextrose Appetite of Normal Rats Treated with Insulin C P Richter, Baltimore—p 781

### American Journal of Public Health, New York

32 1-124 (Jan) 1942

- Adaptation of Public Health Programs to Defense Needs J W Mountain, Washington D C—p 1
- Mobilization of Industrial Hygiene for National Defense W J McConnell New York—p 9
- Urgent Problems in Nutrition for National Betterment W H Schrell, Washington, D C—p 15
- Water Demands and Sewage Production in Military Cantonments S M Ellsworth Boston—p 21
- Relationship of Vocational Rehabilitation to Industrial Hygiene D Amato Washington D C—p 28
- The Public Health Engineer in the Emergency A G Fleming Montreal Canada—p 33
- Results of Serologic Tests for Syphilis in Nonsyphilitic Persons Inoculated with Malaria L E Burney Kan as City Mo J R S Mays, Milledgeville, Ga and A P Iskrent Washington D C—p 39
- Complement Fixation in Rickettsial Diseases Ida A Bengtson and N H Topping Bethesda Md—p 48
- Developing Comprehensive Health Service in Puerto Rico E G Morales San Juan Puerto Rico—p 59
- \*Field Study of Prophylactic Value of Pertussis Vaccine J E Perkins Albany N Y E L Stebbins New York Hilda Freeman Silverman Albany N Y P A Lemhcke Rochester, N Y and B M Blum New York—p 63
- Private Public Health Nursing Agency in Defense Program Katharine Faville New York—p 73
- Is There Need for the Fortification of Milk? E V McCollum Baltimore—p 80

**Prophylactic Value of Pertussis Vaccine**—According to Perkins and his associates, a controlled study of the prophylactic value of phase 1 pertussis vaccine was conducted in Binghamton, N Y, from January 1939 to November 1940, 587 children were given the complete series of injections and

699 acted as controls. The ages of the children varied from 6 months through 4 years. Reactions to the vaccine were negligible. Every family studied was visited once a month by a nurse who did not know which children had been vaccinated and which were controls. During the period of observation the attack rate of pertussis was more than twice as high in the control group as in the vaccinated group, and the pertussis when it did occur among the vaccinated group was distinctly less severe. The secondary household attack rate among the vaccinated group was 34 per cent as compared with 79 per cent among the controls.

**Succinylsulfathiazole and Bacteriostasis**—In an endeavor to find a drug that would not be absorbed from the gastrointestinal tract in sufficient quantities to cause toxic manifestations and that would be effective in the presence of ulcerating intestinal lesions, Poth and his colleagues studied the bacteriostatic activity of eighteen sulfonamide combinations on the gastrointestinal mucosa of dogs. Succinylsulfanilamide and succinylsulfathiazole exerted a decided bacteriostatic activity on the coliform organisms. They possess relatively strong acid properties, liberating carbon dioxide from aqueous solutions of inorganic carbonates and bicarbonates. Succinylsulfathiazole is relatively resistant to chemical hydrolysis and is split by bacteria to yield sulfathiazole. In vitro its bacteriostatic activity against *Escherichia coli* in synthetic mediums is slight, it is poorly absorbed from the gastrointestinal tract and therefore a high concentration can be maintained there without causing untoward toxic reactions. Measured by its inhibition of the coliform flora of the intestine it apparently

has a high bacteriostatic action in the gastrointestinal tract of man. Succinylsulfathiazole causes the stools to become semi-fluid and renders them relatively odorless. The drug is rapidly excreted by the kidneys and its concentration in the blood remains low when it is administered orally. It has not caused severe toxic reactions in man. It is excreted by the liver, in which hydrolysis occurs. The administration of succinylsulfathiazole is suggested preoperatively for patients to be subjected to gastrointestinal operations and for patients with acute intestinal infections, such as typhoid and dysentery. The action of the drug is limited to its local effect on the contents of the gastrointestinal tract.

**Clinical Use of Succinylsulfathiazole**—Poth and Knotts gave succinylsulfathiazole to 100 patients to alter the contents of the gastrointestinal tract. The patients either were convalescents with a normal intestinal mucosa or had typhoid, dysentery, diarrhea, carcinoma or fistula of the colon or the small intestine, ulcerative colitis or diverticulitis. In 5 the count of coliform bacilli was not lowered, in 2 there was severe, uncontrollable diarrhea, in 2 there were blind loops of intestine into which the drug did not enter, and in 1 there was intestinal indigestion, so that the stools did not become semi-fluid during chemotherapy. Because of the profound changes in the count of *Escherichia coli* in the feces, it is likely that various other organisms are affected. While conclusions cannot be drawn from this limited clinical study, the smooth convalescence experienced by the patient given succinylsulfathiazole preoperatively and postoperatively is impressive. One patient in whom anemia developed after a Miles operation for rectal carcinoma died.

**Chemotherapy for Osteomyelitis**—Wilensky reviews the clinical effects of the sulfonamide drugs in the treatment of osteomyelitis. For primary osteomyelitis local, and later, if necessary, general, chemotherapy is indicated. In extension osteomyelitis, particularly that of the cranial bones, chemotherapy has not prevented the disease from spreading and complications from occurring. However, chemotherapy has shown some wonderful results in preventing complications, but even here all local areas of infection must be removed. For acute hematogenic osteomyelitis, chemotherapy is especially indicated in the stage of general infection, the danger of a progressive hidden pathologic process must be kept in mind. In actual practice the treatment of osteomyelitis with one of the sulfonamide derivatives has not produced the startling results obtained in some other conditions, notably pneumonia. Sometimes the proper interpretation of a good result in osteomyelitis is difficult because of the possibility that the beneficial change occurred spontaneously, as often happened before the advent of chemotherapy.

**The Undescended Testis**—Data recorded in the literature suggest that the undescended testis is more liable to malignant change than the normally placed testis. The abdominal testis is more liable to malignant change than the inguinal. Campbell lists six reasons which have contributed to a lack of appreciation of these facts: 1. The medical profession has neglected the science of statistics by trying to draw conclusions from figures without knowing how to manage them. 2. Authors have committed almost incredible errors of misquotation. 3. Differing definitions of the words "cryptorchism," "cryptorchid," "ectopy," "anorchism" and "monorchism" have led to false conclusions. 4. Statistics have been published from hospital practice but not from private practice. 5. Early figures, in which a disproportion between the occurrence of malignant growth in the inguinal and the abdominal testis occurred, have been quoted. This disproportion no longer exists, probably because the abdomen is much more frequently explored. 6. The incidence of malignant change in the undescended testis has not been computed on the number of testes but on the number of patients, thus the true incidence of malignant change in bilateral undescended testes has not been determined. From the literature since 1900 a group of about 1,413 cases of undescended testis with a known incidence of malignant change has been collected, as well as 2,119 cases of undescended testis in which the relative incidence of abdominal and inguinal nondescent is known and 672 cases of malignant growth in the testis in which the

relative frequency of abdominal and inguinal nondescent is known. One in about twenty abdominal testes shows a malignant change, as against one in about eighty inguinal testes. Combined hospital figures reveal about equal numbers of abdominal and inguinal malignant growths. This is because the proportion of inguinal to abdominal testes is about 4:1 and the proportion of cancerous inguinal to cancerous abdominal testes is about 1:4.

### Bulletin of Johns Hopkins Hospital, Baltimore 70 1-100 (Jan) 1942

- Anterior Commissure Tendon of Larynx Its Significance in Laryngofissure Operation Preliminary Note L N Broyles, Baltimore—p 90

***p*-Aminobenzoic Acid and Bacterial Growth**—Park and Wood have shown experimentally that *p*-aminobenzoic acid, though ineffectual by itself, is extremely active as a bacterial growth factor when traces of biotin are present. Therefore they conclude that *p*-aminobenzoic acid is essential to bacterial metabolism and that it may well be involved in the antibacterial action of the sulfonamide drugs.

**Paroxysmal Tachycardia in Infancy**—Bass discusses the occurrence of extreme paroxysmal tachycardia in 2 infants at 3 weeks of age and in 1 at 4 months. One infant recovered, 2 died. No known cause has been discovered for the syndrome. All 3 patients vomited, had extreme pallor and refused to take food. A striking feature was a decided enlargement of the liver. In 2 patients the tachycardia responded to medi-

cation. The patient who lived was definitely saved by digitalization. However, even after the drug had been administered and the heart rate had fallen and a sinus rhythm had been reestablished the tachycardia would reassert itself and continue for many hours, but after three days the heart rate became normal and remained so. In 1 of these 2 patients injections of calcium gluconate reduced the rate for several hours, but the flutter waves returned. The injection of isotonic solution of sodium chloride accomplished the same effect, although sinus rhythm continued for only a few minutes. Large doses of digitalis failed to save this infant. The third patient's attack was so violent that death ensued in three days. Permission for a necropsy of this infant was not obtained. It is possible that some preexisting cardiac anomaly may have been present (congenital hypertrophy?). This patient received digitalis as soon as the author saw her, but as she was already moribund neither giving digitalis nor giving a 25 per cent solution of nikethamide nor immediate administration of oxygen was of any avail. Pressure on the eyeballs or on the neck over the carotid sinus was valueless.

**Ligation of Splenic Artery**—Berg and Rosenthal ligated the splenic artery of 2 patients with thrombocytopenic purpura, of 3 with cirrhosis of the liver with splenomegaly and fascial constriction of the artery and of 1 with osteosclerotic anemia (myelofibrosis), or nonleukemic myelosis. Only a transitory good effect was experienced by the first 2 patients, the decided recurrence of the condition necessitated secondary splenectomy. Ligation was followed by a definite diminution in the size of the spleen of the 3 patients with congestive splenomegaly, 2 of them survived for one year and 1 for three years. The ascites of the latter 1 subsided for two years. The patient with osteosclerotic anemia had slight improvement for only a short period after the ligation. The spleen had apparently diminished in size and again attained its former size about six weeks after operation. The "drosselung," or constriction of the artery, did not influence the progressive weakness, anemia and general condition of the patient. Except in some instances of congestive splenomegaly the results do not warrant the continuance of such a procedure as a substitute for splenectomy. Splenectomy is superior, and it at least removes the element of uncertainty which accompanies ligation of the splenic artery.

**Kidneys in Subacute Endocarditis**—Christian describes pathologic lesions observed in the kidneys of 61 patients who died of subacute endocarditis caused by Streptococcus viridans. Macroscopically the kidneys are slightly swollen and edematous and there are areas of infarction, usually of the anemic variety, and focal hemorrhages, which cause the "flea bitten" appearance described by Horder. In 42 the infarct was observed on gross inspection, in 14 it was observed only under the microscope. Surface focal hemorrhage was present in the kidneys of 8 patients. Microscopically a variety of glomerular lesions, both diffuse and focal in distribution, were observed: acute intracapillary proliferative glomerulonephritis in 80.32 per cent and diffusely distributed, hyaline thickening of the walls of the glomerular capillaries in 16.39 per cent. Five types of focal glomerular lesions were seen: proliferation of the capsular epithelium in 36.06, focal fibrous lesions in 26.23, occasionally complete disorganization of glomeruli, hyaline fibrinoid thrombi in glomerular vessels in 40.98 and masses of bacteria in glomerular capillaries in 6.55 per cent. The focal lesions were present in varying frequency in sections from different kidneys, they rarely dominated the microscopic picture. Albuminuria was present in 78.69 per cent of the patients, and cylindruria was not prominent. Hematuria was found in 75 per cent of the patients. The presence of numerous blood cells in the sediment of the urine suggests a diffuse or focal, proliferative, glomerular lesion rather than infarction or fibrinoid glomerular thrombi. Decreased renal function, indicated by a decreased excretion of phenolsulfonphthalein or an elevation of blood urea nitrogen, was observed in one fourth of the patients, but in none of them did it result in symptoms of uremia.

**Nephrotic Crisis**—Emerson and Van Slyke include all acute febrile episodes with symptoms of peritonitis under the term nephrotic crisis. The symptoms occur and recur in nephrotic children, with or without demonstrable bacteremia. Farr, MacFadyen, MacLeod and their collaborators show that the attack

is preceded by a loss of body nitrogen and a dramatic fall in the amino acid of the plasma. Recovery is regularly accompanied by a rise in the amino acid of the plasma. The intravenous administration of amino acid appears to reduce the mortality rate. Prior to the administration of amino acid the mortality rate was 69 per cent, whereas there were no deaths among 11 patients less than 10 years of age who had thirty-two crises and were given amino acid intravenously. Only 1 patient so treated died. This was an older patient who in addition to the nephrotic crisis had an infection that was resistant to sulfapyridine.

**Pleural Mesothelioma**—Klemperer and Tedeschi report a case of diffuse neoplasm of the pleura which arose from the cells lining the mesothelium. The complex structure of the tumor, composed chiefly of lipofragile reticulum cell-like elements and of cells which resembled lymphocytes in different phases of development, is explained by the multiple developmental potentiality of the mesoderm which comprises the coelomic "mesothelium." Throughout the entire illness there was no suggestion of a neoplasm in any other part of the body, and at necropsy no other primary growth was found. The following microscopic observations supported this view. There were strands of dense connective tissue growing inward from the thickened pleura and often lined by a noncontinuous layer of mesothelial cells in atypical proliferation. The capillaries, with severe fibrous thickening of their walls resulting in the formation of large hyaline bodies, were numerous. There were masses of peculiar cells within the lough formed by the intersecting fibrous trabeculae.

Iron Requirement of Children of Early School Age. Frances A. Johnston and Lydia T. Roberts, Chicago—p. 181

\*Ascorbic Acid Requirements of Children. O. A. Bessey and Ruth L. White, Boston—p. 195

**Vitamin C Metabolism in Adults**—Storvik and Hauck determined the daily urinary excretion of ascorbic acid and the fasting levels of ascorbic acid for twenty-one twenty-eight day periods in the plasma of 2 normal men and 4 women on controlled intakes of ascorbic acid. From the response to the test dose at the end of each period, supplements of 65 to 150 mg of ascorbic acid, in addition to approximately 10 mg in the basal diet, were required by the subjects for maintaining tissue saturation.

**Iron Requirement of Children**—To determine the requirement of iron by preschool children, Johnston and Roberts selected 12 boys and 8 girls from 8 to 11 years of age who for several years had lived in an institution whose standards of nutrition and physical care are high. The children's hemoglobin levels at the start of the investigation were considered a product of their diet. Matched groups of 3 children were given graded amounts of iron for seven months, after which the hemoglobin level was again determined. The data indicate that a good hemoglobin level can be maintained on a daily intake of 114 mg, or 0.35 mg per kilogram of body weight, when the rest of the diet is adequate. A higher intake is not needed, as the hemoglobin level of children given 2 or 4 mg of supplementary iron daily for seven months did not rise. It is possible that a lower intake might have been adequate.

**Ascorbic Acid Requirements**—Bessey and White estimated the requirement of ascorbic acid by determining the level of the acid in the blood plasma of 93 healthy city children receiving variable amounts of ascorbic acid in their food. The data indicate that 3 ounces (90 cc) of orange juice a day, or its equivalent in other citrus fruit juice, or 6 ounces (180 cc) of tomato or tangerine juice, plus the small amount of the acid that obtains in other foods, which probably totals not more than 10 mg a day, is sufficient to produce an optimal postabsorptive

concentration of ascorbic acid in the plasma of the average child 5 to 13 years of age. Orange juice is assumed to contain 15 mg of ascorbic acid per ounce, therefore the daily requirement may be placed at 40 to 50 mg. The amount of ascorbic acid obtained from food other than citrus fruits and tomatoes was insufficient to influence the level of ascorbic acid in the blood plasma. This emphasizes the necessity of a regular consumption of citrus fruits or tomatoes if an optimal postabsorptive value is to be maintained.

\*Study of Antidotes for Fluorine. S. Marcovitch and W. W. Stanley, Knoxville, Tenn.—p. 235

**Antidotes for Fluorine**—According to Marcovitch and Stanley, the fluoborates when fed in powdered form were non-toxic to rats and insects. In solution, enough fluorine was liberated to produce toxic effects. Aluminum sulfate and hydrated lime protect animals from a lethal dose of sodium fluoride when mixed with the latter. Boric acid, through the formation of a fluoborate, also has some value as an antidote. Aluminum sulfate mixed with the sodium fluoride and used as a roach powder produces a lower kill than is obtained with sodium fluoride alone. To prevent the mistaking of sodium fluoride for flour, sugar or baking powder, some manufacturers are now coloring it a dull blue. As a further precaution the National Pest Control Association suggests that more be known about its antidotes.

**Sulfapyridine Treatment of Acute Gonorrheal Urethritis**—Pappas used the four day intensive course of sulfapyridine for the treatment of 59 soldiers with acute previously untreated gonorrhea and 9 who had previously failed to be cured.

with sulfanilamide. The method employed was that suggested by Winter in 1940 the '8-7-7-6' plan or the administration of 8, 7, 7 and 6 Gm of sulfapyridine on the respective four days of treatment. Fifty-three, or 90 per cent, of the 59 patients were apparently cured and were returned to duty after an average of fourteen and four-tenths days of hospitalization. The 6 patients not cured had a definite amelioration of symptoms, but evidence of drug failure was demonstrable either during or soon after the completion of chemotherapy. The 53 patients could have been returned to duty in an average period of five and three-tenths days if irrigations and provocative tests had been omitted. The 9 patients who were resistant to sulfanilamide responded to sulfapyridine treatment. Their average stay in the hospital was seventeen and one-tenth days, but they could have been returned to duty in about eight and three-tenths days if provocative tests had not been done. Eight patients were followed up for an average of three and five-tenths months and 54 for an average of eight months. There were no relapses of infection even though many immediately indulged in alcoholic and venereal excesses. Practically all of them were subjected to the physical stress and strain incident to marches and maneuvers in the jungle during March 1941. The author believes that the institution of inadequate drainage early during chemotherapy and small oral doses with the erratic individual absorption rates are the primary factors responsible for sulfapyridine resistant infections, asymptomatic carrier states and consequent late relapses.

**Ulcerative Colitis.**—During the last ten years Daniels has seen 25 persons with ulcerative colitis, most of them were referred by physicians for psychiatric consultation and treatment. Of 14 followed for five to eight years, 8 showed a pathologic attachment to a relative (in 6 the death of this relative had been of paramount importance), indecision about marriage was definite in 2 unmarried members, in 2 engagement and marriage were the precipitating causes of the first attack and in 2 the onset of symptoms was associated with childbirth. Financial difficulties had a special significance in 4. As a group the patients were not well adjusted sexually, although generally this was not the presenting problem. Except for the basic factors relating emotions to disturbances of the large intestine, the psychophysiologic mechanism of ulcerative colitis is not understood. Observations in mucous and spastic colitis may eventually aid in elucidating the mechanism. Much can be said of the relation of personality to disease of the colon. The author's impression is that the difference lies in the more narcissistic organization of the personality in ulcerative colitis, with the underlying reaction more a psychotic than a psychoneurotic one. At times the symptoms mask a severe depression. The recurrent character of the disorder may be significant in this regard. In several instances the disease seemed definitely a type of organic suicide. In many instances there is a direct relation between the severity of the physical reaction and the underlying psychopathologic condition. Psychoneurosis rarely causes death, psychosis frequently does.

**Gonococcal Infections.**—Cox points out that of 440 men with gonococcal infection treated at the Boston Dispensary with sulfathiazole only 265 entered the clinic during the first week of infection with no previous treatment and were under observation long enough for a series of cultural studies to be done. Of the 265, 41 had clinically active gonococcal infection at the end of the second week, and in addition 26 became asymptomatic within two weeks but one or more cultures were positive between the first and eighth weeks after the patients were free from symptoms. The remaining 198 patients represent the cure rate

that can definitely be attributed to sulfathiazole. There was no significant difference in the cure rate of those men who had and those who did not have local treatment. There were few toxic symptoms, and none were serious enough to necessitate withdrawal of the drug. However, sulfathiazole is not entirely without toxic possibilities, drug fever, rash, nausea, headache and renal complications have been reported.

Heterogeneous Renal Disorders. J. H. Talbot. Boston—p 228.

**Pain on Effort.**—Boyer and White encountered 4 persons in whom pain of the upper right quadrant precipitated by exertion and relieved by rest was the presenting symptom of early failure of the right side of the heart. It is evidently due to acute hepatic congestion and is comparable to dyspnea on effort in early failure of the left side of the heart. Direct questioning of a group of 40 patients who had clinical evidence of failure of the right side of the heart or who were likely subjects revealed that 45 per cent had such pain at some time. The pain is a symptom to which the patient rarely attaches much significance, as it is overshadowed by other, more severe, symptoms. The symptom, if sought diligently, may prove to be a common and reliable warning of early weakness of the right ventricle.

**Helium in Anesthetic Mixtures.**—Thomas and Jones outline a method for preventing the explosion of combustible anesthetic mixtures. The method is based on the fact that not every combustible gas, vapor or dust will burn or explode when its oxygen content, different for each combustible, is reduced below certain definite values. In the case of combustible anesthetics, their concentration cannot be altered to any great extent because definite amounts are required for the desired degree of anesthesia. Nonexplosibility must therefore be brought about by replacing part of the oxygen with a flame quenching medium and one that is not objectionable to the patient breathing the mixture. The relative explosibility of cyclopropane-oxygen-helium, ether-oxygen-helium and ethylene-oxygen-helium mixtures is given, and it is shown that ether requires the lowest range of oxygen concentration, ethylene assumes an intermediate position and cyclopropane permits a high concentration of oxy-

can to be present while nonexplosive conditions are maintained. Therefore helium can be used to the best advantage in cyclopropane-oxygen mixtures for the prevention of explosions and to a slight advantage with ethylene or ether-oxygen mixtures.

**Gastrosocopy in Differentiating Gastric Ulcer and Carcinoma**—The experience of Cleri and Wirts with 14 cases of gastric ulcer and 20 of gastric cancer emphasizes the importance of gastrosocopic examination. Roentgen study suggested that in 9 of 11 cases of gastric ulcer the ulcer was probably malignant and that in 2 it was probably benign. In each of these 11 cases a diagnosis of benign ulcer was made gastrosocopically. In 8 improvement followed medical management and the lesion disappeared completely and in 3 the benignity of the lesion was proved at operation. In 3 of the remaining cases of gastric ulcer, roentgen study failed to reveal a lesion but an ulcer was seen gastrosocopically. In 2 of these, medical treatment caused the lesion to disappear, and in the third the ulcer, because of its size and thickened edges, was considered malignant at the first gastrosocopic examination but later was proved to be benign. The roentgenologist described the lesion in 11 of the cases of cancer of the stomach as "possibly" or "probably" malignant, whereas at gastrosocopic examination a definite diagnosis of a malignant growth was made in each case. The diagnosis in 9 was proved at operation and in 2 by peritonoscopy, both of the latter showed metastasis. Roentgen examination failed to show a gastric lesion in the 9 remaining cases, in which gastrosocopy revealed carcinoma. In 7 of these cases operation confirmed the diagnosis, in 1 operation was refused and 1 was considered a poor surgical risk because of advanced diabetes mellitus.

## Union Médicale du Canada, Montreal

71 113-222 (Feb) 1942 Partial Index

- \*Clinical Study of Epidemic of Poliomyelitis and Encephalitis Superimposed in 1941 in the West of the United States and Canada. W. J. McCormick, Toronto—p. 127

**Epidemic of Poliomyelitis and Encephalitis**—McCormick investigated in Winnipeg hospitals the alimentary habits and the excessive physical exertion of patients in the course of a simultaneous epidemic of poliomyelitis and encephalitis. He reviews the clinical histories of a certain number of patients of each group. All the patients who were questioned had had a diet extremely poor in vitamin B. The majority had been physically overworked before the onset of the disease. In some cases the disease itself had been preceded by certain forerunning

signs which lasted for weeks, months or years. This premonitory period suggests a predisposition or the existence of certain factors which, when associated, at a given moment give rise to the acute phase of the disease. This conception all accords with the role classically attributed to contagion but harmonizes well with the author's theory of avitaminosis. In support of this theory he cites a certain number of observations concerning the age and sex of the patients and the seasonal variations of the frequency of poliomyelitis and encephalitis. He also discusses the role which avitaminosis may play in equine encephalomyelitis. In connection with the virus the author proposes a new theory which considers the biochemical by-products of avitaminosis, explaining by this fact the failure of preventive and therapeutic measures commonly employed. A laboratory technique remains to be found which will detect the avitaminosis in the victims of these disorders. It is also necessary to try vitamin B therapy in the acute and the convalescent periods of these epidemic diseases. Since the present treatment of poliomyelitis and encephalitis is ineffective and since B avitaminosis is almost general, the author suggests that double the quantity of vitamin B<sub>1</sub> that is normally necessary be given as a prophylactic measure to children during the summer vacation period and to laborers who work in an overheated atmosphere.

## Wisconsin Medical Journal, Madison

41 1-100 (Jan) 1942

- Parental Test Differentiation of "Functional" Fever from That of Infectious Origin. M. J. Fox, Milwaukee—p. 19

- Adequacy of Iodized Salt for Goiter Prevention. E. L. Sevringhaus and J. H. Barbour, Madison—p. 40
- Evaluation of Medical Treatment in Rheumatoid Arthritis. G. W. Carlson, Appleton—p. 42

**Laryngotracheobronchitis**—Troup and Weaver discuss the salient features of laryngotracheobronchitis and stress the importance of cooperation by all persons concerned in its treatment. Laryngotracheobronchitis is characterized by intense inflammation of the larynx, trachea and bronchi. The product of inflammation forms a sticky, gumlike exudate in the air passages and obstructs them. The disease in its typical fulminating form occurs most often in children less than 2, and it is in them that the mortality rate is so high. It does attack older children, but in them it is not so severe or fulminating. The mucosa and submucosa of the trachea and bronchi are involved by the inflammation from the larynx. The result of treatment depends on an early diagnosis, and hence internists and pediatricians should acquaint themselves with all the clinical, bronchoscopic and pathologic phases of the disease. The mild form of the disease responds to adequate fluid intake, steam inhalations and oxygen therapy. For the fulminating form tracheotomy, the prevention of plugs and crusts in the tract and bronchi by keeping the air in the room hypersaturated with moisture, keeping up the fluid and food intake and the bronchoscopic removal of plugs or crusts if they form despite the measures mentioned are indicated.

**Sulfapyridine for Pneumonia in Children**—Bigler states that during the last eighteen months sulfapyridine has been used for the treatment of 244 children with pneumonia. From the clinical and the roentgen examination a diagnosis of lobar pneumonia was made in 197 and of bronchopneumonia in 47. The temperature of the patients with lobar pneumonia returned to normal and they were clinically improved within an average of one and one-tenth days, as compared to an average of five and two-tenths days for a group not receiving chemotherapy. The period of hospitalization averaged three and six-tenths days longer for the patients not receiving sulfapyridine. Sulfapyridine did not seem to influence the frequency or the course of complicating empyema. The drug was also moderately successful in the treatment of bronchopneumonia. The mortality was 16 for both series of patients. Minor toxic manifestations due to sulfapyridine were common.

Vasomotor Phenomena Occurring in Blood Donors—

Brown and McCormick discuss the vasomotor phenomena observed in 48 or 5 per cent of a group of blood donors. The phenomena are commonly called "faints," although loss of consciousness is not common. When a donor faints the head is immediately lowered, and the donor remains on the bleeding couch until well enough to walk to the recovery room. Half of the donors who fainted had a history of previous fainting, either associated with or independent of bleeding and nervousness. About as many faint after the full amount of blood has been taken as faint during the actual donation. It is sometimes reported that donors have fainted after their return to work, and probably the incidence of fainting is higher after than during venesection. The most common symptoms and signs are flushing, pallor, sweating, slowing of the venous stream, convulsions, a lowering of the blood pressure and pulse rate, faintness, dizziness and giddiness. Nausea or an uneasy feeling in the epigastrium and a feeling of heat, if they occur, are usually the first indication that something is wrong. Other, less common, symptoms are a sensation of tingling, general numbness, yawning, a desire to defecate, blurred vision and ringing in the ears. Donors often sleep after a severe faint. Faints may be (1) mild with a transitory pallor, clamminess, faintness and a lowering of the pulse and blood pressure, (2) severe with great pallor, drenching perspiration and an extreme fall in pulse rate and blood pressure, (3) mild or severe with vomiting, (4) mild or severe with convulsions and (5) mild or severe with vomiting and convulsions. The recovery period may vary from a few minutes to an hour or more. It is not uncommon for donors to improve temporarily and then to relapse. The donors are not alarmed by their experience. The vasomotor phenomena of the faints have many points in common with those of the 'effort syndrome' in soldiers. The fact that the faints of most donors take place in the recumbent position may account for the fact that consciousness is not lost as it is in the effort syndrome of soldiers. The venesection may also possibly be a modifying factor. The author believes that the faints are brought about by the same efferent pathways as those in the carotid sinus syndrome.

**Sulfathiazole Ointment for Impetigo**—Steigman compared the relative value of two ointments by treating one side of 20 impetigo patients with ammoniated mercury and the other

side with a 5 per cent sulfathiazole ointment. The latter ointment was prepared by incorporating 5 per cent by weight of powdered sulfathiazole in a base of soft petrolatum. After the second day of treatment (the ointments were applied three times a day) it was possible to state which preparation had been used on each side. Impetigo treated with the ammoniated mercury healed rather slowly though steadily, requiring an average of eight days. Impetigo treated with the 5 per cent sulfathiazole ointment showed improvement in forty-eight hours and was healed by the fourth or fifth day. In addition to the 20 mentioned 31 other patients were treated with 5 per cent sulfathiazole ointment without the author's attempting a comparison. The lesions of these patients were also noticeably improved in forty-eight hours and healed in four to five days. Impetigo of the scalp was more resistant, and for 7 patients with this condition an average of eight days was required for healing. The impetigo was often accompanied by scabies and treatment of the parasitic infestation was greatly facilitated by clearing up the impetigo first. Antisclerotic therapy could then be carried out more efficiently, with less discomfort and fewer recurrences.

**Hemochromatosis**—Willis gives an account of the post-mortem data on 7 fatal cases of hemochromatosis or bronze diabetes, observed at the Alfred Hospital during the last six years. In 3 of the 7 patients the liver exhibited multicentric carcinoma. Their ages at death ranged from 38 to 72 years, conforming with Sheldon's conclusion that the disease is rarely seen in young people. Except for the patient who died at 38 from an unrelated complaint with no clinical evidence of bronze diabetes, the age at death of all patients exceeded 48 years. Six of the 7 patients were men. In Sheldon's analysis the ratio of male to female patients was 20:1. The male predominance is probably even greater, as the disease, being rare in women, is more likely to be reported when it occurs in them. Hemochromatosis is of slow development and of long duration. Even after the syndrome is recognized, patients often live for many years. No significant relationship to any particular occupation has been established. The fully developed disease is recognized by the triad diabetes, pigmentation of the skin and hepatic enlargement and later ascites. The most obvious and constant macroscopic observation at necropsy is the distinctive pigmentation of the liver, pancreas and neighboring lymph glands. The liver if seen in an early preclinical stage of the disease as in the author's youngest patient, may show typical pigmentation before it is either cirrhotic or enlarged or it may be cirrhotic but not enlarged. On the cut

surface the pigmentation of the liver usually shows a distinct and characteristic lobular pattern, which, as microscopic examination shows is largely because the deposits of pigment are heaviest in the liver cells at the margins of the cirrhotic lobules. In the pancreas, as in the liver it is also probable that pigmentation precedes fibrosis with most pigmentation in the parenchyma cells. Microscopic study does not support either of two commonly held ideas regarding the causation of the diabetic state—that it is due to pancreatic fibrosis with atrophy of the islet cell tissue or that it is due to impaired function of the islet cells because of overloading by pigment. Therefore the diabetic state must be related to hemochromatosis in some more subtle way. The spleen is usually slightly to moderately enlarged and gives a positive prussian blue reaction. The characteristic pigmentation is often obscured by its naturally being dark red. Sometimes heavy pigmentation may be seen in the gastric and intestinal mucous membranes, the myocardium and the adrenals. The presence of carcinoma in 3 of the 7 cases suggests that the frequency of this complication may heretofore have been underestimated. The carcinomas were malignant hepatomas, and they almost invariably appeared to have arisen independently in multiple foci. The disease recalls the multiple development of malignant lesions in susceptible areas. Advanced hemochromatosis is clearly just such a precancerous state with regard to the hepatic cells, and when hepatic carcinoma supervenes the entire liver must be looked on as incipiently cancerous. The tumors remain unpigmented, microscopically they are white and contrast sharply with the surrounding brownish red hepatic tissue. Microscopically no pigment granules are found in them.

**Interpretation of Electroencephalogram**—Ohm points out that Berger's invention of the electroencephalograph in 1924 signified a great advance in research on the brain. The author's studies on miners' nystagmus may throw light on the interpretation of electroencephalographic records. The records Ohm made of miners' nystagmus greatly resemble electroencephalographic records. In all curves the waves are nearly sinus shaped. He suggests that the oscillations of the eye muscles in nystagmus disclose the oscillations of a brain center. In a book entitled *Nystagmus as Brain Radiation*, published in 1924, he concluded that the vital function of the ganglion cell consists in a production of pendulum-like (i. e. sinus shaped) electrical oscillations. This capacity of the sinus cell is intrinsic (intrinsic tonus), it reacts to incoming stimuli with a change in frequency (extrinsic tonus). The neurons of the optic tract have a rhythmic action even in the dark (dark tonus), but they act with a lower frequency than in the presence of illumination (light tonus). Frequency is the essential characteristic of the ganglion cell, amplitude is not characteristic.

The nystagmus curves record the activity of a small center in the vestibular nuclei, the electroencephalogram, however, is taken from an extensive region of the cranium. The differences in the curves obtained by Berger and Rohrer and by Kornmüller the author ascribes to the fact that the first named investigators made their records from the intact cranium whereas Kornmüller took his recordings directly from the surface of the brain.

### Surgical Treatment of Intracranial Cholesteatoma—

Graser reports 3 cases of cholesteatoma successfully treated by surgical intervention. The first patient, a man aged 31, had sudden acute symptoms with attacks of convulsion, paralysis and aphasia. The symptoms suggested a malignant bleeding glioma, but the arteriogram excluded this diagnosis and suggested a benign tumor. The exact type of the tumor could not be determined before operation. The sudden onset may have been caused by serous meningitis following disintegration and absorption of the tumor or by circulatory disturbances in the region of the anterior cerebral artery. A postoperative febrile condition with stupefaction and a dreamy twilight state is ascribed to the same cause. The fact that for a long time the tumor caused no symptoms might be explained by the extra-cerebral, well circumscribed position of the tumor. The tumor of the second patient, a man aged 33, was typical of a slowly growing, benign tumor. The neurologic symptoms suggested a tumor of the posterior cranial fossa, possibly of the acoustic nerve, the cerebellum or the medulla oblongata. The air picture disclosed outlines of the tumor on the roof of the fourth ventricle. Operation disclosed a cholesteatoma of the fourth ventricle with attachment at the calamus scriptorius. Patient 2 also had a central fever after the operation. The third patient, a man aged 57, remained free from a postoperative increase in temperature. The benign, slowly growing tumor, which involved the left temporo-parieto-occipital region, early produced a clear pathologic picture. The arteriogram and phlebogram proved of differential diagnostic value. Roentgenoscopy without a contrast medium disclosed typical bone erosions above the extradural cholesteatoma. The mental functions of patient 3 improved slowly after the operation, he was completely normal after several months.

### Cerebroelectrical Investigations in Genuine Epilepsy

Kornmüller and Janzen report investigations on 43 patients with genuine epilepsy and on 3 with pyknopsy. Emphasis was placed on the care with which each patient was examined over long periods. On a number of patients registrations were made continuously for twenty-four hours. The authors describe cerebroelectrical manifestations not associated with the attack and during the attack. The question of the epileptogenic focus still dominates research on epilepsy. Animal experiments indicated that an epileptogenic focus is bioelectrically characterized by the appearance of convulsion current discharges. The evaluation of the cerebroelectrical observations during the attack furnished the authors with a new point of view for the interpretation of bioelectrical manifestations during the interval. It was observed that during minor epileptic attacks abnormally slow oscillations appear over extensive regions. These records resemble those obtained during the interval either spontaneously or during hyperventilation. During the minor attacks the cortical changes can be regarded as effects of noncortical foci. The abnormal manifestations during the interval presumably have an analogous origin. If the clinical manifestations give no indication of an attack-like abnormal process, it can probably be explained from the localization of the primary point of attack of the epileptogenic stimulus. According to this interpretation there would be no difference between some only bioelectrically detectable interval manifestations and certain minor attacks. It must be assumed also that abnormal processes may take place which are detectable neither bioelectrically nor clinically. From a primary focus the function of various other gray parts is modified by nervous channels, and these secondary foci exert effects on a third group of areas, and so on. Thus rather complicated mechanisms must be expected, during the attack more functional connections will probably become evident than is the case under physiologic conditions.

## Book Notices

**Occupational Diseases. Diagnosis, Medicolegal Aspects and Treatment**  
By Rutherford T. Johnstone, A.B., M.D., Director of the Department of Occupational Diseases, Coiden State Hospital, Los Angeles. Cloth. Price \$7.50. Pp. 558 with 132 illustrations. Philadelphia & London: W. B. Saunders Company, 1941.

The effects of environment on health and particularly of occupation on morbidity and mortality have intrigued the curiosity of many astute medical observers. Under this traditional form of self-improvement the medical and allied professions have accumulated a body of information designed to recognize and manage individual examples of intoxication or other ill effects of uncontrolled working environment. This volume on the occupational diseases is the best compilation to date of verified and practical experience in the fields of diagnostic and remedial industrial medicine. It still leaves for other hands or future editions of the book to develop in much stronger terms the important concept that the hope of industrial medical service lies in prevention. This attitude can hardly be developed in professional minds through relatively inconspicuous discussions of prophylaxis under treatment. The last few decades have witnessed an enormous acceleration of scientific interest in the prevention of occupational disease, most noticeable in recent years under the program of attack by official and other agencies set up to explore and control industrial exposure. The effect of these programs will certainly have an influence on the point of view of the whole profession about industrial disability.

Good professional management of industrial accidents and diseases is, and always will be, a great medical responsibility. Johnstone's chapters on medicolegal considerations ably reflect this point of view and at the same time underscore again the physicians' bewilderment that such important legislation is so frequently framed without seeking competent advice about all medical aspects. Occupational disease compensation schedules have been adopted without any reference to the character of regional industrial exposures. Only recently has there been any effort to base remedial legislation on surveys of actual working conditions and on the character of occupational disease reporting. Medical organizations must strenuously object to such illogical methods just as much as they object to senseless limitations in medical and hospital benefits, admission of bad or biased medical testimony, or other loose administrative practices.

The main objective of the book is to deal consecutively with all the common and many uncommon causes of occupational disability including the industrial back, hernia, the dermatoses and the troublesome neurosis and malingering problems. Certain sections possibly may not withstand careful scrutiny by advanced workers in this field, but for all ordinary purposes and especially for the physician in community practice these discussions will carry the imprint of wide experience and judicious selection. The reported 11,000 annual admissions to the author's clinic, representing multiple and varied diseases and conditions, will be a source of mingled envy and concern to all other industrial clinicians—envy at this enormous concentration of material and concern that preventive industrial medicine and industrial hygiene have made such little headway in southern California. To a generation of employers, workers and physicians who are coming to recognize the considerable effect of occupational disability on the public health, the obvious suggestion will be to emphasize much more strongly in works of this character specific instruction in those fundamental medical and hygienic principles on which eradication of occupational disease must ultimately rest.

**Seasonal Influence on Growth Function and Inheritance** By A. B. Fitt. New Zealand Council for Educational Research. Educational Research Series No. 17. Cloth. Price 10s. 6d. Pp. 182 with 11 illustrations. Christchurch, N. Z.: Whitcombe & Tombs Ltd. London: Oxford University Press, 1941.

This monograph represents the author's extracurricular pursuit of a scientific hobby for over a quarter of a century. While his findings might have been of interest to American readers of a decade ago, the facts can today be found much more adequately presented in the writings of Huntington (*Season of Birth*), Mills (*Medical Climatology*) and various other authors to whom Fitt makes no reference. While familiar with

the literature of twenty-five years ago the author seems not to have kept well abreast of more recent work. The greater part of the monograph deals with the physiologic and health aspects of seasonal influences; here the author's lack of medical or physiologic training becomes painfully evident as he flounders along through numerous and inconclusive citations. The build up to his final chapter on conclusions and implications leaves the reader quite at sea regarding the purpose of the book. Because infant mortality and general death rates are low in the autumn and high in late winter and early spring, Fitt concludes that general vitality is highest in the autumn months, quite overlooking the fact that vitality may well be highest in those very winter and spring months when unstable weather brings greatest frequency of respiratory infections. The graphs are poorly done and lack uniformity. No basis whatever can be found for including "inheritance" in the book's title. There is little that is new or worth while for American medical readers in this publication.

**Psychogenic Factors in Bronchial Asthma. Part II** By Thomas M. French, M.D., and Franz Alexander, M.D. With the collaboration of Catherine J. Bacon, M.D., et al. *Psychosomatic Medicine Monographs*, Volume II, Nos. I and II. Published with the Sponsorship of the Committee on Problems of Neurotic Behavior, Division of Anthropology and Psychology, National Research Council. Paper. Price \$3. 1p. 236. Washington, D. C.: National Research Council, 1941.

This monograph consists of the records of 11 adults and 7 children, sufferers from bronchial asthma who were experimentally treated by psychoanalysis at the Chicago Institute for Psychoanalysis. It is the work of eleven authors and is published as the second part of a larger monograph. Part I, published earlier in the same year and reviewed in *THE JOURNAL*, Dec. 20, 1941, gave a summary and an interpretation of the findings in these and 9 other unreported cases in adults and indicated certain constant features in the psychology of the asthma patient and the asthma attack. The patient's great dependence on a mother or mother figure, a greater proportion of dreams dealing with pregnancy, abortion and intrauterine existence, replacement of the infantile crying reaction by the asthmatic attack, and several minor findings were found uniformly, and a chapter could in effect be written that might well appear in a textbook description of asthma—a chapter on the psychology of the asthmatic and of the asthmatic attack. The relation of allergy to the attack and its psychologic provocation was speculatively considered and the two factors were seen as complementary. It was pointed out that the attacks occurred when there was an unresolved conflict and tension rather than when there was a true or even partial expression of instinctual activity. The present monograph (part II), which is purely descriptive, will give the interested reader an opportunity to learn the empirical basis for such statements. Particularly it furnishes detailed accounts of the exact psychologic situations that precipitate the attacks. The protocols are extensive enough too to furnish to the interested reader insight into many particulars not dealt with in the summary.

**State Board Questions and Answers for Nurses. Essay and Objective Types Compiled from Actual Examination Questions Given Throughout the Country by State Examining Boards.** Twentieth edition, 1942 revision. Fabrikoid. Price \$3.50. Pp. 1084. Philadelphia: Montreal & London: J. B. Lippincott Company, 1942.

This book comprises hundreds of questions compiled from examinations for nurses given throughout the country by state examining boards and the answers. It is arranged in four parts: (1) biologic and physical science, (2) medical science, (3) nursing and allied arts, (4) nursing ethics and history of nursing. The book opens with a short chapter on suggestions to assist nurses in preparing for passing state examinations. The subdivisions are indexed in order to make it simple to find questions on particular subjects, for example, questions relating to bone and cartilage appear from pages 3 to 20, questions concerning nursing during the puerperium from pages 725 to 735, questions concerning general nursing care of children from pages 832 to 851, and so on. The book is edited by eleven women, mostly nurses who occupy important positions on the staffs of universities, hospitals and examining boards. Aside from its value to nurses preparing to pass state board examinations, the book offers much of practical value to others interested in the nursing care of the sick.

**Mule Spinners Cancer Epithelioma of the Skin in Cotton Spinners** By J. M. Brookbank M.B.L., M.D., F.R.C.P., Medical Referee for Industrial Diseases Manchester Boards, Price, 1s. Pp 36, with Illustrations London H. K. Lewis & Co., Ltd., 1941

The author of this small monograph has had an opportunity to see a great many cases of epithelioma of the skin commonly known as mule spinners' cancer, and therefore his comments and conclusions are valuable to any one interested in this type of malignant growth. The monograph is written from the industrial point of view and covers the subject thoroughly, recommending periodic examination of workers in the cotton spinning industry and emphasizing preventive measures to the workers. It also contains specifications for several lubricating oils. There are six illustrations showing early epithelioma of the skin and one depicting the machine which gives this type of epithelioma its name.

**Symptom Diagnosis Regional and General** By Wallace Mason Yater A.B. M.D. M.S. Professor of Medicine and Director of the Department of Medicine Georgetown University School of Medicine Washington D. C. Originally written by the late Wm. J. M. Barton A.M. M.D., F.A.C.P. and Wallace M. Yater A.B. M.D. M.S. Fourth edition Fabrikoid Price \$10 Pp 900 New York & London H. Appleton-Century Company Incorporated 1942

The fourth edition of this practical book includes seventeen tables of differential diagnosis and some other features that are distinctly new. The two indexes have been combined. Obviously not as many changes are necessary in a work of this type as would be involved in one devoted largely to therapy, since the advances in diagnosis come more slowly and must be extensively confirmed before they can be given the status of conclusion in an authoritative book. The arrangement of the volume permits ready reference to any symptom with which the physician may be concerned and the cross references enable more extended study once a lead has been found toward a positive diagnosis.

**Business Procedures** By Perry H. Taylor Joint Committee of the Twentieth Century Fund and the Good Will Fund and Medical Administration Service Inc. Paper Price 25 cents Pp 180 Boston Edward A. Filene Good Will Fund 1941

As a pioneer effort in the field of accounting and business practices for prepayment medical plans, this work will be welcomed by all concerned in organizing and conducting such plans. Lack of experience with such plans necessarily makes the detailed instructions in accounting, collection and general office procedures largely theoretical. Contract group plans occupy the center of discussion with only occasional references to medical society plans although the medical societies now provide medical care to several times as many persons as all the contract plans.

**Professional Dentistry in American Society A Historical and Social Approach to Dental Progress An Introductory Text for Students and Professional Health Workers** By Alfred J. Asks Ph.D. D.D.S. Assistant Professor of Oral Surgery and Lecturer on Orientation at the New York University College of Dentistry Student edition Cloth Price, \$1.50 Pp 175 with Illustrations New York Clinical Press 1941

Dentistry came into existence as a profession much later than medicine. The period of professional awakening, 1820-1840, preceded the establishment of medical schools and the rise of medical journalism. Dentistry has now reached a state in which it can be considered "as an oral health service." It is playing its part in public health and in the development of a preventive program. The author is inclined to favor the application of some type of insurance to dental care. He is especially anxious that dental education should include training in the social problems affecting dentistry, and this volume is intended to be an introductory textbook to further that object.

**Organization and Administration of Group Medical Practice** By Denu A. Clark M.D., and Katharine G. Clark Joint Committee of the Twentieth Century Fund and the Good Will Fund, and Medical Administration Service, Inc. Paper Price, 25 cents Pp 109 Boston Edward A. Filene Good Will Fund, 1941

The work as a whole fills the need for frequently requested information for a working manual on the organization and conduct of group practice. Its most significant weakness is that such organizations as the University of Chicago Clinics and the Mayo Clinic are discussed along with various contract pre-

payment and industrial groups as if they were all of the same type and pattern. In the chapter on scope and standards of service it is assumed that the same principles of "selection of personnel" are used in these varieties of organization, which is contrary to the facts. Although eight university and charitable or private reference clinics (under which are listed the Lahey and Mayo clinics), and only seven of the contract type are studied, most of the comments are given to the contract practice. There is a chapter on the appraisal of group medical service which is disappointingly indefinite.

**Synopsis of Genitourinary Diseases** By Austin J. Dodson, M.D. F.A.C.S., Professor of Genitourinary Surgery, Medical College of Virginia Richmond Third edition Fabrikoid Price \$3.50 Pp 307, with 112 Illustrations St. Louis C. V. Mosby Company, 1941

This book is divided into fourteen well arranged, compact chapters. The author gives the usual consideration to the general principles of urology and the methods used in arriving at an adequate diagnosis of urologic diseases, such as a careful history, physical examination and the various methods of urologic examination. In this edition, material on the application of sulfamamide and its derivatives has been added and that on the etiology of urinary calculi rearranged. The discussions are clearcut, so that information is quickly obtained. As the title indicates and the author states, the book is a synopsis and as such is a ready and valuable addition to the book shelf of the busy practitioner. Likewise it has an appeal to the medical student as a handy review of urology. It is not a reference book, and little if any space is devoted to controversial theories. The information is sound.

**Los Angeles County General Hospital House Staff Manual** By the Attending and House Staffs of the Los Angeles County General Hospital Second edition Paper Price, \$3 Pp 181 Los Angeles, 1941

This volume contains rules and regulations of the house staff and a list of therapeutic procedures compiled for the guidance of interns and resident physicians in the various clinical and laboratory divisions of the hospital. It follows the general plan of house staff regulations as required in all hospitals approved for intern training but is more extensive than the average manual of this type, since it is designed to meet the inpatient and emergency needs of one of the largest hospital services in the country. Other hospitals seeking guidance in the preparation of a suitable "procedure book" will find this manual exceedingly helpful.

**Creative Group Work on the Campus A Developmental Study of Certain Aspects of Student Life** By Louise Price, Ph.D. Teachers College Columbia University Contributions to Education, No 830 Published with the Approval of Professor Ruth Strang, Sponsor Cloth \$3.25 Pp 49 New York Bureau of Publications, Teachers College, Columbia University, 1941

From Stephens College and Stanford University comes this contribution to the study of certain aspects of student life. The investigation was made largely by the case method, although it is extensively documented with bibliography. This preliminary study leads the authors to recommend the development of specialized auxiliary services such as speech, posture and grooming, the addition of a staff capable of advising students on personal and group problems, including standards of participation in social and other leisure activities, and improvements in the faculty. Many new fields of research are proffered to institutions which wish to extend studies in these fields.

**Doctor Wood Modern Wizard of the Laboratory The Story of an American Small Boy Who Became the Most Daring and Original Experimental Physicist of Our Day—But Never Grew Up** By William Seabrook Cloth Price, \$3.75 Pp 335, with 15 Illustrations New York Harcourt Brace & Company, 1941

The ability of William Seabrook as a writer is here turned to the study of an eminent physicist whose work at Johns Hopkins University, particularly on the physics of light, has gained worldwide recognition. He did much to debunk scientific cranks and frauds, and many of his observations have been of aid in criminology. The book is supplemented by a bibliography of scientific publications of Professor Wood, including two hundred and sixty-three references, the latest in December 1941.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### MILK AS A PREVENTIVE OF LEAD POISONING

To the Editor—Please advise whether the taking of large quantities of milk has any bearing on the prevention of lead poisoning. Is the giving of milk to lead workers a common practice in industry?

Peter J. Dinatale, M.D. Batavia N.Y.

ANSWER.—Few physicians will gain any advantage from the consumption of milk by workmen exposed to lead, not so much because milk has any specific action in preventing lead poisoning but because it is an excellent supplementary dietary agent. While lead poisoning may arise with less frequency among workers exposed to lead who are supplied with milk, it may not be regarded as a specific preventive agent against lead poisoning. Supporters of a high daily milk intake point out that the calcium thus provided tends to immobilize the lead in bony structures, thus saving the body against its action. Antagonists believe that, even though this is true, any such calcium promoted storage merely defers the evil day when for other reasons the lead in larger quantities will be mobilized from bony tissues in the blood stream and clinical lead poisoning will arise. Without necessarily referring to milk as such, many publications have been made on the influence of calcium on lead poisoning prevention and treatment. A number of such items later are cited. From them a few statements are now excerpted.

Lederer and Bing state that "the evidence that milk would be of value is largely presumptive" and "the amount of lead stored in the body is diminished by the addition of calcium carbonate to the diet," and, further, the beneficial effect of calcium appears to be due to the prevention of absorption of lead from the intestinal tract, but it is here noted that in the greater number of cases lead poisoning follows inhalation rather than absorption from the alimentary tract. However Dannenberg and his associates, condemning the use of ascorbic acid, favor a high calcium-phosphorus diet, given along with other agents in the treatment of lead poisoning. Sobel and his associates, in discussing the biochemical behavior of lead, note that the deposition of the metal in body tissues is directed by a system of its own, which is governed by the same laws as calcium deposition but not necessarily in the same direction. The effect of calcium on lead deposition is essentially competitive and apparently thus not desirable. Holmes and his associates have carried out extensive work with ascorbic acid, chiefly alone but at times combined with calcium and other agents. Apparently these authors attach greater significance to vitamin C than to calcium. In the treatment of lead poisoning, calcium in various forms has been used extensively, as reviewed by Johnstone. There appear to be good reasons for stating that the use of milk for lead workers is most commendable but not as the keystone of a program for the prevention of lead poisoning.

### CHEMICALS USED IN CURING TOBACCO

To the Editor—What chemicals are used to cure tobacco? Are they injurious to the human organism?

J. A. Schurgot, M.D. Grafton Ohio

ANSWER.—Humidity, temperature, ventilation and pressure are the chief measures utilized in controlling the plant and microbial enzymatic processes which constitute the curing of tobacco. Constituents of the earth added fertilizers or insecticides or their derivatives present in the raw tobacco may remain in the finished product or may be altered during the curing.

Chemicals used in manufacturing tobacco products vary with the type and brand of the product, and their identity is often kept secret. Sweetening agents, such as licorice, sugar and molasses are added chiefly to chewing tobacco. Liquors containing salts may be used in wetting down pipe tobaccos. Flavoring agents like vanilla may be added to snuff. Hygroscopic materials, such as glycerin or glycols, are added to cigarette tobacco to keep it moist. Other agents may be added at times to affect the burning qualities, appearance, taste or smell of tobacco products.

Aside from literature on irritant aldehydes derived from hygroscopic agents, little has been published regarding added substances in ordinary tobacco products which may be of any hygienic significance as compared with the nicotine and the products of combustion of the tobacco itself.

### CORONARY INSUFFICIENCY OR PAGET'S DISEASE?

To the Editor—A man aged 45 has had severe pain in the chest for the past two months. He is a husky man who had never had a sick day in his life. Pain was indicated in the left upper quadrant of the chest radiating down to the left elbow. Attacks would come during walking but also during sleep. No substernal pressure or dyspnea was admitted. Straightening up the back either on standing or on sitting would help relieve the seizure which in any event lasted only a minute or two. No sweating or apprehension was elicited. Administration of glyceryl trinitrate relieved the attack but substitution of acetylsalicylic acid in pills of the same size also gave relief (probably because the attacks were so short lived anyway). The heart is normal on physical, roentgenographic, fluoroscopic and electrocardiographic examination. Numerous heart tracings were all negative. Tracings taken after exertion [walking up and down a flight of stairs] and breathing a mixture of a low concentration of oxygen show no significant changes in RS-T segments or T waves. A provocative test with epinephrine gave negative results. Cervical arthritis, hiatus hernia and mediastinal tumors have been reported absent on roentgen examination. An equivocal reaction to the Graham test was reported; there were no calcular shadows. The blood and blood pressure were normal. Neither pain in the shoulder nor motion nor swelling (or atrophy of the hand) is present. On the positive side, a foreign body was found accidentally in the arm 3 cm. below the axillary fold. This was removed with no change in the status. Evidence of proliferative osteitis (Paget's disease) was found in the right humerus, both clavicles and the scapula. The skull was normal. Attacks continue to recur in spite of rest in bed for three weeks. (There was no relief during the regimen of rest.) The administration of sedatives, xanthine drugs and thiamine hydrochloride and local infiltration of the brachial plexus had no effect. Is this coronary insufficiency? In spite of a normal roentgenogram of the spine, can Paget's disease be responsible for the attacks of pain in the chest and in the arm?

M.D., Connecticut

ANSWER.—It seems most unlikely that this pain has its origin in a deficient coronary circulation. The lack of other symptoms of coronary artery disorder and the failure of the various tests to produce pain would argue strongly against a coronary origin.

The distribution of the pain to both the chest and the arm strongly suggests pressure on one or the sensory roots or possibly on one of the upper cervical sympathetic ganglions. If the diagnosis of Paget's disease is assured it is more than likely that the source of the pain lies in bony pressure. Severe cramping pain in muscle often accompanies Paget's disease. Straightening the back as a method of relief suggests pressure that may be relieved by change of position. It seems unlikely that the biliary tract can be responsible for the symptoms. Roentgenograms of soft tissue should be made to rule out the presence of calcareous deposits in the muscle as a source of irritation.

### BACTERIOPHAGE THERAPY FOR TYPHOID

To the Editor—I am reporting at our staff meeting a case of typhoid in a child of 14 months. I am sure that the bacteriophage will come up in the discussion. In reading what I can find on the subject I am impressed by (1) the apparent success of the bacteriophage treatment in the cases reported by J. M. Frawley in *California and Western Medicine* (48 415 [June] 1938) and (2) its complete disappearance as a therapeutic agent. Can you tell me the answer? 1 Was it found ineffectual? 2 Was it too dangerous? 3 Why if it was useful did it fall into disrepute? 4 Does anybody use it now?

H. G. Bull, M.D. Ithaca, N.Y.

ANSWER.—The article referred to in *California and Western Medicine* deals with lysed vaccine, not bacteriophage. The results, obtained in only 4 cases, are not convincing, and no control tests were made. Numerous studies made with vaccines of various kinds have given suggestively good results, but many investigators believe that the effect is a nonspecific one.

A study of critical reports in *THE JOURNAL* by Eaton and Bayne-Jones (Dec. 8 1934, p. 1769, December 15, p. 1847 and December 22, p. 1934) and by Krueger and Scribner (May 10 1941, p. 2160, and May 17, p. 2269) will supply detailed answers.

to all the questions raised with regard to the use of bacteriophage in the treatment of infectious diseases. According to Eaton and Bayne-Jones "the literature on the treatment of typhoid with bacteriophage indicates that this agent has, apparently, no striking effect on the course of the disease except perhaps on the production of reaction followed by temporary relief." Krüger and Scribner conclude that "bacteriophagy in vivo is of rare occurrence."

Therefore with few exceptions it is not logical to rely on the lytic power of the phage in the treatment of disease.

In answer to the specific questions raised it may be said that

1 Bacteriophage is generally found to be ineffectual, its effects are neutralized in vivo by dilution and by the presence of serum or pus.

2 It occasionally causes severe reactions.

3 It is not useful.

4 It is still used by various observers, chiefly in experimental studies.

### DROOLING IN A CHILD

To the Editor—A girl aged 7½ years (premature at birth she weighed 5 pounds [2.3 Kg]), whose mother was eclamptic during pregnancy, had convulsions during the first month of life but has not had convulsions since. The chief complaint is excessive dribbling from the mouth. The child understands everything but does not attempt to say any words. She has been at school for two years. She has a severe squint and myopia. The head measures 17 inches (43 cm) and the chest 23 inches (58 cm). The child is normal in weight but 3 inches (7.6 cm) shorter than average. Amphetamine sulfate, thyroid and atropine have been advised. Would anything else be beneficial?

M. D., Canada

ANSWER—Dribbling or drooling from the mouth in a 7½ year old child is definitely abnormal and may arise from a variety of conditions among which are mental deficiency and other organic or functional nervous disturbances. Judging from the history, one would suspect that the child had an organic brain lesion possibly resulting from toxemia in the mother and prematurity in the infant. Convulsions during the first month of life frequently result from organic brain disease. The fact that the child does not talk at 7½ years further indicates an organic brain disturbance with or without mental backwardness. Before one attempts to treat the drooling, a thorough neurologic and psychiatric study should be made including spinal puncture and pneumoencephalography. The drooling is merely a symptom which will not respond to thyroid therapy unless the child suffers from hypothyroidism which does not seem likely. Atropine may inhibit the flow of saliva to a certain extent, especially if the drooling is secondary to hypersecretion.

If however the drooling is due to inability or to neglect in swallowing the saliva, only psychiatric therapy will avail if the child is able to understand what is desired and provided the swallowing reflexes are functioning properly.

### LOW URETERAL STRICTURE AFTER URETEROLITHOTOMY

To the Editor—I have observed several cases of surgical removal of a stone from the lower portion of the ureter with a persistent urinary discharge at the operative site. In most cases a catheter could not be passed via the cystoscope and reoperation had to be done. What method is advocated to eliminate this complication?

C. H. Whiting, M.D., New York

ANSWER—Factors which may contribute to this complication are (1) damage to the mucosa and the wall of the ureter caused by trauma from an impacted stone, (2) localized periureteritis at or near the site of the stone and (3) improper surgical technique. The most common cause of stricture following ureterolithotomy probably is overenthusiasm on the part of the surgeon in effecting closure of the ureter so that it will be water tight. Great care should be taken to avoid reducing the lumen of the ureter. It probably is advisable to place any stitch that is inserted in the ureter to close the opening made by the ureterolithotomy only in the adventitia and not through the entire ureteral wall. It is not necessary to close the opening of the ureter so that it is water tight. If there is evidence of trauma or infection of the ureter at the time of ureterolithotomy a ureteral catheter should be introduced into the ureter so that one end extends into the bladder and the other end extends up the ureter. When periureteritis is present or develops later, thorough drainage of the periureteral tissues is essential.

In case postoperative stricture is formed, the procedure to correct it depends largely on the condition of the kidney. If the site of the ureterolithotomy is low enough and if the stricture is impassable to a ureteral bougie, reimplantation of the ureter into the dome of the bladder may be tried. If the ureteral lesion is too high for this procedure, nephrectomy probably will be necessary. Nephrectomy would be indicated anyway in case of extensive infection or disease of the kidney.

### PAINTS AND MULTIPLE SCLEROSIS

To the Editor—A man aged 35 has been engaged in spraying paint on automobile trucks for fifteen years. He sprays both the primer and the secondary coat. He wears a mask, but occasionally when without a mask he gets the fumes from adjacent sprayers. He now presents the typical findings of advanced multiple sclerosis. Can this syndrome be attributed to his occupation? I am aware that increased lead is found in the spinal fluid in patients with multiple sclerosis. I do not know that the paint spray contains lead.

M. D., Illinois

ANSWER—In the query no mention is made of any of the symptoms present in a case of lead poisoning. These are anemia, abdominal pain, headache, a blue line on the gum, arteriosclerosis, basophilic degeneration of the red cells and lead deposits in the long bones. Lead can produce changes in the brain, spinal cord and peripheral nerves. These are in the form of an encephalopathy, myelopathy or neuropathy. There has been no clinical or pathologic proof that lead intoxication can cause the typical symptoms of multiple sclerosis. The lead found in the spinal fluid of patients with multiple sclerosis has not been in excess of that found in the fluid of other patients. The patient's syndrome, therefore, cannot be attributed to his occupation of spraying paint. Some paint sprays (for the primer and the secondary coat) contain lead and some do not.

### ALCOHOLISM AND SYPHILIS

To the Editor—The combination in the same patient of chronic alcoholism and third stage syphilis is frequently observed in practice, most patients being men in their fifties and sixties. Is it wise to give thiamine and iodides at the same time? If so, is it possible to give the two substances in one prescription, and could you advise a good formula for such a prescription? The textbooks do not contain statements about the compatibility of vitamins with other drugs.

M. D., Massachusetts

ANSWER—There is no reason why it would not be possible to give iodides before the meals and follow with the thiamine hydrochloride after the meals. With regard to a formula it should be stated that what might be indicated for one patient would possibly be entirely out of order for another. The same would apply to the dosage. Both of these preparations may be used as indicated. We are not aware of either the presence or the absence of incompatibility between iodides and thiamine or of incompatibility with the other vitamins.

### FISSURES ON TIPS OF FINGERS

To the Editor—A patient consulted me about small painful fissures which periodically develop on the tips of the fingers, more frequently on the thumb of the right hand, less frequently on the fingers of the right hand and least frequently on the fingers of the left hand. They usually occur on the lateral margin of the digits near the end of the nail, are tender and occasionally bleed. Not infrequently they are aggravated by an infection of the upper respiratory tract. They vary from 0.2 to 0.4 cm in length, have sharp edges and strongly resemble knife cuts. Does the condition suggest a vitamin A or B deficiency?

M. D., Massachusetts

ANSWER—Cases of the type described are common in winter. Often the condition is due to contact with external irritants, such as alcohol, soap and water, dye on clothing and occasionally the nickel plating of safety pins. (Downing reported such a case several years ago.) Cold weather and the frequent use of soap and water are contributory factors. Possibly, however, the dryness which causes the skin to fissure may be due to lack of vitamin A. The local use of an ointment such as the following is of considerable value.

|                                 | Gm or G.   |
|---------------------------------|------------|
| Tincture of benzoin compound    | 4          |
| Salicylic acid                  | 0.50       |
| Hydrous wool fat and petrolatum | to make 30 |

The avoidance of soap and water, the use of acidolate in place of soap and the taking of fairly large doses of vitamin A should be of considerable help.

### TREATMENT OF CARCINOMA OF THE CERVIX

To the Editor—Two years ago I saw a patient who had carcinoma of the cervix, which was proved by biopsy. This condition was treated with radium and high voltage roentgen therapy. There has been no recurrence during the past two years. Do you think a panhysterectomy is indicated?

M. D., West Virginia

ANSWER—The prognosis with radium and high voltage roentgen therapy equals that of radical surgery in the treatment of carcinoma of the cervix. Unless there are unusual complications in this case there is no advantage to be gained from removal of the uterus. The cervix should be kept dilated and the patient examined from time to time, under anesthesia if necessary.

## TESTS OF CARBOHYDRATE METABOLISM IN INFANTS

SAMUEL LIVINGSTON, M.D.  
AND  
EDWARD M. BRIDGE, M.D.  
BALTIMORE

Although the dextrose tolerance test has been widely used both in pediatrics and in general medicine for the recognition of disturbances in carbohydrate metabolism difficulties are often encountered in the interpretation of the results obtained. In part these difficulties appear to arise from a lack of conformity to accepted technics and consequently also to inadequate standards for comparison. In addition, there has been a tendency to view certain characteristics of blood sugar curves as specific for individual diseases without giving adequate consideration to the complexity of the physiologic processes involved. The present study was, therefore, undertaken with a view toward a better standardization and interpretation of the tests used to evaluate the state of carbohydrate metabolism in small infants.

### METHODS

In the present study, the various tests of carbohydrate function commonly used in clinical medicine have been applied to a group of selected normal infants. The tests involved observations on the rise and fall of the blood sugar after oral and intravenous dextrose, dextrose and insulin, epinephrine, levulose and galactose. The infants varied in age from 1½ to 24 months. All were patients who had been admitted to the hospital wards for non-nutritional problems such as repair of harelip, clubfoot, or acute infections from which they had since recovered. They were ready for discharge when the tests were begun but were kept in the hospital as normal subjects for the study. The patients had been receiving a regular hospital diet for at least two weeks prior to the performance of the test, and at least five days were allowed to elapse before a second test was made on the same subject. Capillary blood for the blood sugar determinations was obtained from finger pricks. The Hagedorn-Jensen<sup>1</sup> method of sugar estimation was employed.

In the oral tests the dextrose was dissolved in the volume of liquid usually taken at a feeding which included 1 to 2 ounces (30 to 60 cc) of orange juice. The carbohydrate content of this was calculated as part of the total dextrose. To study the effect of different doses of dextrose on the blood sugar response the

patients were given 1, 1.75 and 3 Gm of dextrose per kilogram of body weight after a standard fasting period of twelve hours. Samples of blood were taken at the usual intervals—fasting and thirty, sixty, one hundred and twenty and one hundred and eighty minutes after the ingestion of the sugar. In the intravenous tests, 50 per cent dextrose which is available in sterile 20 cc ampules was used and the patients were given 1 Gm of dextrose per kilogram following a twelve hour fasting period. The injection was given slowly over a period of two to four minutes. Samples of blood were obtained just prior to the injection and at intervals of ten, thirty, sixty, ninety and one hundred and twenty minutes afterward.

The so-called insulin sensitivity test consisted in the administration of dextrose orally and insulin subcutaneously. The procedure of the present study was to perform first an oral dextrose tolerance test, using 3 Gm of dextrose per kilogram of body weight. After an interval of not less than five days the test was repeated with the patient receiving in addition ¼ unit of regular insulin per kilogram of body weight subcutaneously. The insulin was injected exactly ten minutes after the patient started to drink the dextrose solution. This procedure was employed because otherwise the hypodermic injection might have upset the infant and caused him to refuse the dextrose. Blood samples were collected at the usual periods—initial fasting, thirty, sixty, one hundred and twenty and one hundred and eighty minutes. The curves obtained with and without insulin were compared and the degree to which the alimentary hyperglycemia was suppressed by the insulin was taken as an indication of the degree of sensitivity to insulin.

The rise and fall in blood sugar level after the administration of epinephrine (epinephrine tolerance test) was also investigated. After the usual twelve hour fasting period 0.03 cc (½ minim) of a 0.1 per cent solution of epinephrine hydrochloride per kilogram of body weight was injected subcutaneously. Blood samples for the estimation of sugar were obtained at the same intervals as for the oral dextrose tolerance test.

For the levulose and galactose tolerance tests a similar procedure was followed. After a twelve hour period of starvation either 1 or 1.75 Gm of the sugar per kilogram was given by mouth. The sugars were dissolved in water and given without added flavoring. It was found convenient to use hot water to obtain rapid solution of the galactose. Blood for sugar analysis was obtained at the usual intervals during a period of three hours. No attempt was made to distinguish dextrose from levulose or galactose in the blood. The data for blood sugar level therefore represent a sum of the two. Pfanstiehl 90 per cent levulose, which is practically free from other sugars, was used. The impurities for this grade are described as calcium, levulosate and moisture

From the Department of Pediatrics of the Johns Hopkins University School of Medicine and the Harriet Lane Home of the Johns Hopkins Hospital.

<sup>1</sup> Hagedorn H. C. and Jensen B. N. *Biochem. Ztschr.* 135: 46, 1923.

This form of levulose is much less expensive than the 100 per cent chemically pure grade and for practical purposes is satisfactory. For the galactose test d-galactose (anhydrous) prepared by the Eastman Kodak Company was used.

TABLE 1—Blood Sugar Curves of Normal Infants Following a High Fat Diet and a Regular Diet

| Case    | Dextrose,<br>Gm. per<br>Kg. of<br>Body<br>Weight | Type of<br>Diet | Blood Sugar, Mg. per 100 Cc. |                        |     |     |     |
|---------|--|-----------------|------------------------------|------------------------|-----|-----|-----|
|         |  |                 | Fast <sup>1</sup><br>mg.     | Minutes After Dextrose |     |     |     |
|         |  |                 |                              | 30                     | 60  | 120 | 180 |
| A       |  | Regular         | 81                           | 136                    | 165 | 130 | 82  |
| B       |  | Regular         | 78                           | 140                    | 130 | 161 | 88  |
| C       |  | Regular         | 85                           | 176                    | 136 | 112 | 81  |
| Average |  |                 | 81                           | 147                    | 144 | 135 | 85  |
| A       |  | High fat        | 70                           | 139                    | 220 | 181 | 153 |
| B       |  | High fat        | 65                           | 129                    | 230 | 191 | 140 |
| C       |  | High fat        | 73                           | 146                    | 200 | 178 | 148 |
| Average |  |                 | 71                           | 138                    | 230 | 181 | 141 |

The formulas were prepared by adding either butter fat or cane sugar to a whole powdered milk base in the following proportions:

| Fast Diet           |           | Regular Diet        |          |
|---------------------|-----------|---------------------|----------|
| Whole powdered milk | 5 Gm.     | Whole powdered milk | 130 Gm.  |
| Butter fat          | 7 1/2 Gm. | Cane sugar          | 50 Gm.   |
| Water to make       | 1000 Cc.  | Water to make       | 1000 Cc. |

The whole powdered milk which was prepared by Mead, Johnson & Co. of Evanston, Ind., contains protein 2.8 per cent, fat 28 per cent, lactose (by difference) 37.7 per cent, ash 1 per cent, and moisture 1.1 per cent. When thus prepared the high fat formula contains fat 9 per cent, carbohydrate 34 per cent, protein 1.5 per cent, water and minerals 87.4 per cent. The regular formula contains fat 5.9 per cent, carbohydrate 34 per cent, protein 3.8 per cent, water and minerals 79 per cent.

#### EFFECT OF PRECEDING DIET AND OF FASTING PERIOD

It is well known that the nature of the diet preceding a dextrose tolerance test has a distinct influence on the results obtained. Among the various workers in the field Himsworth<sup>2</sup> and Sweeney<sup>3</sup> particularly have shown that an increased proportion of carbohydrate in the diet results in a low blood sugar curve whereas an increased proportion of fat in the diet causes a high and prolonged curve suggestive of "starvation diabetes." The height and prolongation of the curve bear a rough quantitative relationship to the proportions of carbohydrate and fat ingested. Relatively little attention has been given to this phenomenon in the interpretation of clinical data.

The present study afforded an opportunity for confirming these results on 3 small infants under the carefully controlled conditions of a metabolism ward. The infants were first tested while receiving diets of usual proportions. Later the fat content of the diet was increased until 85 per cent of the total calories was obtained from fat. The results, which are presented in table 1, show a distinctly high and prolonged blood sugar curve following the high fat diet. This is in agreement with more extensive investigations reported by others and reemphasizes the necessity of attention to diet when dextrose tolerance studies are being made.

Starvation, which affects metabolism similarly to a high fat diet by stimulating the utilization of large quantities of fat from the depots, is of equal importance. The so-called starvation diabetes has been recognized since the observations of Lehmann<sup>4</sup> in 1874 and Hofmeister<sup>5</sup> in 1890. In animals du Vigneaud and Karr<sup>6</sup>

have shown that the height and duration of the blood sugar curves were increased progressively by previous fasting up to as long as twenty days. In human beings, the effects of short periods of fasting on the dextrose tolerance test are not generally appreciated. Bridge<sup>7</sup> has demonstrated on adults that an additional four to eight hours of fasting beyond the usual overnight period results in a distinct change in the dextrose tolerance test. While comparable observations have not been made on infants heretofore, it is well known that they withstand starvation less well than adults. Attention to this factor is obviously needed.

In a small group of infants, the effects of different periods of preliminary starvation on the dextrose tolerance test were observed. So far as possible, the same infants were employed to make the comparison between six, twelve and twenty-four hours of fasting. A test dose of 3 Gm. of dextrose per kilogram was used in all, and the tests were not repeated in less than five days. As will be seen in table 2, the blood sugar curves obtained after a six hour fast were very similar in the 3 infants studied. The maximal rise in blood sugar was less and appeared earlier than after the twelve hour fast. When the preliminary fast was extended to twenty-four hours, the effects on the sugar curve were somewhat irregular. In 4 patients the return to normal was delayed, but the maximal level attained was not necessarily higher than after the twelve hour fast. In 1 infant the more prolonged fast resulted in a distinctly low blood sugar curve. In general, starvation appears to affect infants as it does adults by causing changes in the direction of so-called starvation diabetes. Other factors are probably operating to account for the exceptions.

It is also interesting to note in table 3 the effect of starvation on the fasting blood sugar level. Normal infants showed little variation after the standard twelve hour fast. However when the fast was extended to twenty-four hours all 6 patients showed either low or

TABLE 2—Blood Sugar Curves of Normal Infants After Different Periods of Preliminary Starvation and After the Ingestion of Three Grams of Dextrose per Kilogram of Body Weight

definitely hypoglycemic levels. Possibly this tendency to hypoglycemia is related to the low blood sugar curve mentioned in connection with the more extended fast.

#### ORAL DEXTROSE TOLERANCE TEST

As commonly used in adult medicine, the oral dextrose tolerance test consists in the administration of a standard amount of dextrose after an overnight fast and

been 1.75 Gm per kilogram. It is generally assumed that the rise in blood sugar level will be comparable to that found in adults. That this is not strictly correct is evident from the observations to be reported and from the observations in the literature.<sup>8</sup> As a means of determining the most satisfactory quantity of dextrose to use a group of normal infants was given 1, 1.75 and 3 Gm of dextrose per kilogram following a twelve hour fast. So far as possible, the same infants were used for all three doses, the usual interval of five days being maintained between tests.

It will be seen from the data in table 4 that the blood sugar response was influenced by the amount of dextrose ingested. In the majority of the tests the maximal rise with each dose was obtained within one-half to one hour, although occasionally not until two hours. In most tests the level of blood sugar had returned to the initial fasting value in three hours. There was no overlapping between the groups. A maximal rise in blood sugar to 160 to 180 mg per hundred cubic centimeters and a return to a normal level within three hours can, therefore be considered a normal response to a test of 3 Gm of dextrose per kilogram for infants under the age of 2 years. Standard conditions of preceding diet and fasting period should, of course, be adhered to.

#### INTRAVENOUS DEXTROSE TOLERANCE TEST

In studying disturbances of carbohydrate metabolism it is frequently helpful to eliminate the factor of absorption by injecting the dextrose directly into the blood stream. The usefulness of such tests has been discussed recently by Crawford<sup>9</sup> by Ross<sup>8</sup> and by Tunbridge and Allibone.<sup>10</sup> To obtain standards from which to judge the results of such injections, 15 normal infants have been studied. After the regular twelve hour preliminary fast they were given 1 Gm of dextrose per kilogram intravenously and samples of blood were taken ten, thirty, sixty, ninety and one hundred and twenty minutes

later. No attempt was made to determine the maximal level of blood sugar reached which should occur within one-half to one minute. As will be seen in table 5, the blood sugar remained high during the first half hour. In all patients the initial fasting value was reached within one and one-half hours after the injection and never in less than one hour. By the technic used, therefore curves returning to the fasting level in less than one hour or later than one and one-half hours should be considered abnormal.

#### THE INSULIN SENSITIVITY TEST

The activity of insulin in promoting the withdrawal of dextrose from the blood stream has received relatively little attention in infants. In older children and in adults two types of tests have been employed, the injection of insulin alone and the administration of insulin combined with a standard amount of dextrose.<sup>11</sup> In the present study of infants, a simple dextrose tolerance test was first performed with 3 Gm of dextrose per kilogram. After an interval of not less than five days the test was repeated, giving in addition  $\frac{1}{4}$  unit of regular insulin per kilogram subcutaneously ten minutes after the patient began to drink the dextrose. The degree of sensitivity to insulin was measured by comparing the blood sugar level of the two curves one hour after the ingestion of the dextrose. This point in the two curves was selected for comparison to avoid errors caused by the temporary hyperglycemic action of impurities in commercial insulin preparations and to minimize the effects of variations in the rate of absorption of the dextrose.

As will be seen in table 6, the dose of  $\frac{1}{4}$  unit of regular insulin per kilogram of body weight results in a definite lowering of the blood sugar curve but without hypoglycemia in the group of normal children studied. Larger doses of insulin proved unsatisfactory because of the development of hypoglycemia which confused the

administration of epinephrine. After preliminary trials, a test dose of 0.03 cc. (1½ minims) of a 0.1 per cent solution of epinephrine hydrochloride per kilogram of body weight was found to be satisfactory. The preceding diet, the fasting period and the time for taking blood samples were the same as for the dextrose tolerance test. The results are shown in table 7. In the 10 patients studied the maximal rise in blood sugar occurred in one hour in 9 of them and in one-half hour in 1. These findings are in general agreement with those obtained by other workers in studies of older children and of adults.<sup>12</sup>

LEVULOSE AND GALACTOSE TOLERANCE TESTS

The so-called carbohydrate liver function tests, namely the levulose and galactose tolerance tests, give an index of the rapidity with which these sugars can be converted into dextrose and stored as glycogen. The literature on the subject has been reviewed by Tomlinson,<sup>13</sup> who lists many investigations done since the original work of Strauss<sup>14</sup> in 1901. Strauss observed that, whereas only 10 per cent of normal subjects showed levulose in the urine following the ingestion of this sugar, the phenomenon was manifested in 90 per cent of subjects having disorders of the liver. Shirohauer<sup>15</sup> modified

the procedure of Strauss by introducing total blood sugar estimation in place of urinary sugar excretion. Various improvements in technic have been proposed from time to time<sup>16</sup> so that, at present, methods are

available for determining levulose or galactose in the blood directly. The simpler procedure, however, of determining the rise in total blood sugar after the ingestion of a standard quantity of the sugars has been employed in the present study. The technic consisted in the administration of 1 Gm. and 1.75 Gm. of levulose or galactose per kilogram of body weight to a group of normal infants after the usual twelve hour fasting period and the determination of the total blood sugar response. The figures obtained represent the sum of the basic dextrose value and the additional concentration of the levulose or galactose.

As will be seen in table 8, following the ingestion of 1 Gm. of levulose per kilogram of body weight the maximal and minimal increases in the blood sugar level were 22 and 4 mg. per hundred cubic centimeters respectively. In the 10 patients studied the maximal rise occurred in one hour in 8 of them and in an equal number the return to the fasting value occurred within two hours. Our results are in agreement with those of Tallerman<sup>17</sup> in showing that a larger test dose of levulose makes no appreciable change in the blood sugar response.

Similar studies were made using galactose instead of levulose. As will be seen in table 9, wide variations were obtained. Since total blood sugars were estimated, it is impossible to conclude whether the sharp rise in sugar level observed in some patients was due directly

to the increase in blood galactose or whether the galactose stimulated the formation of dextrose from glycogen. In either case the lack of consistency in the response of normal infants created doubts concerning the usefulness of the procedure as an index of liver function in children of this age.

COMMENT

For the recognition of clinical disturbances in carbohydrate metabolism, the dextrose tolerance test has become an accepted procedure. In the absence of glycosuria it frequently calls attention to a hidden abnormality. While the test is simple to carry out, its interpretation is complex. An unusually high and prolonged curve, so commonly considered to be evidence of a "decreased tolerance," means merely that the sum of the rates of disappearance of sugar from the blood (storage, utilization and excretion) falls short of the rate of absorption of the ingested sugar. The opposite may be said of the low or flat curve, usually interpreted as evidence of "increased tolerance." Little can be inferred concerning the adequacy of the specific functions involved.

If progress is to be made in our understanding of disturbances in carbohydrate metabolism, means must be available for evaluating such important phases as (1) rate of absorption, (2) ability to build up glycogen reserves, (3) ability to maintain a normal blood sugar level by glycogen breakdown or, when the glycogen reserves are consumed, by protein breakdown and (4)

ability of the tissues to use dextrose. At the present time too little is known concerning the fundamental physiology of these integral processes of metabolism to make it possible to apply procedures to clinical problems with entirely satisfactory results. The hope of progress lies in becoming able to interpret abnormal blood sugar curves in terms of disturbances in the physiologic processes involved. The present study was undertaken with this point of view in mind.

The conditions under which tests of carbohydrate function are performed are of necessity somewhat different with small infants than with older children or adults. The standard overnight fast preceding the test for adults has no counterpart in small infants receiving feedings every three or four hours throughout the day. Formula feedings vary widely in proportions of fat, protein and carbohydrate with appreciable effects on the "dextrose tolerance." And in addition an inadequate caloric intake of both children and adults can affect the test by forcing the metabolism to draw on the fat depots instead of utilizing a normal diet of the usual proportions. It is important, therefore, both in infants and in adults, that the conditions preceding the test be maintained constant in order that satisfactory comparison with standards may be possible.

In the present study a fast of twelve hours preceding the test has been found satisfactory for full term infants up to 2 years of age. While the data reported show relatively small differences between the blood sugar curves obtained after a six and twelve hour fast, the shorter one would frequently fail to bring out a hidden tendency to fasting hypoglycemia, which is important to know. The twenty-four hour fast is obviously too long, for even normal infants may exhibit hypoglycemia, ketosis and an abnormal blood sugar curve at this time. In the case of premature infants weighing less than 2.5 kilograms and receiving feedings every two or three hours throughout the day, it seems advisable to reduce the fasting period somewhat. Such infants quite probably have a smaller glycogen reserve than full term and older children, and a shorter fasting period would therefore be comparable to the twelve hour fast of normal infants. In no case, however, should the fast be less than nine hours.

Too frequent repetition of the dextrose tolerance test also affects the results. John<sup>18</sup> demonstrated this fact by performing daily tests on the same patient for five successive days, using the same dose of dextrose each time. The results of the experiment showed that on the first day the hyperglycemia reached a peak of 260 mg per hundred cubic centimeters, with a return to normal at the end of three hours. On the fifth day the peak was only 90 mg per hundred cubic centimeters. From this and other reports it has therefore seemed advisable to repeat tests of carbohydrate function at intervals of not less than five days.

It has sometimes been stated that the quantity of dextrose administered was relatively unimportant. Our experience indicates that this is not the case with infants, for the blood sugar curves resulting from doses of 1, 1.75 and 3 Gm of dextrose per kilogram of body weight are distinctly different and show no overlapping. The smallest dose not infrequently gives a low curve which might easily be confused with the flat curve seen in certain diseases. Using the dose of 1.75 Gm per kilogram equivocal results are sometimes obtained, but in our experience the large dose of 3 Gm per kilogram for

infants under 2 years of age has been most satisfactory, differentiating clearly between normal low and high curves. We therefore believe that 3 Gm of dextrose per kilogram of body weight should be adopted for use with infants under 2 years and a somewhat smaller amount for older children to be comparable to the dose of 1.5 Gm per kilogram which has proved satisfactory for adults.

Rate of absorption undoubtedly plays a role in the type of blood sugar curve obtained. Such conditions as celiac disease, intestinal tuberculosis and pressure from enlarged viscera are known to interfere with absorption, while intestinal hypermotility, gastroenterostomy, hyperthyroidism and emotional disturbances may speed up absorption. All low or flat blood sugar curves should of course be considered as possibly resulting from delayed absorption. Our experience with adults suggests that curves rising to a high level in one-half hour often mean increased rate of absorption. An index of the normality of the absorptive mechanism may be obtained by comparing oral with intravenous curves or with curves obtained by placing the dextrose directly into the duodenum by stomach tube, and by tests of intestinal motility, since rate of absorption appears to bear some relationship to peristaltic activity. For the intravenous test in infants we have found 1 Gm of dextrose per kilogram given over a period of two to four minutes to be satisfactory, the blood sugar returning to the original fasting level within one and one-half hours after the administration of the dextrose. The blood sugar levels at ten minutes and one-half hour appear to have no significant utility and can be omitted without loss.

Glycogen deposition cannot, of course, be measured directly in human beings. However the fasting respiratory quotient of animals has been shown to vary with the glycogen content of the liver, and it is well known that in human beings the fasting respiratory quotient depends directly on the composition of the diet.<sup>19</sup> At present, experiments are in progress designed to utilize the stability of the respiratory quotient during fasting as an index of glycogen reserves. A report of this aspect of the work will be published later. For the present, in the absence of respiratory data on the general metabolism of the individual, one must interpret carbohydrate storage and utilization together from the height and the rate of fall of the blood sugar curve, eliminating if possible abnormalities in the absorptive mechanism.

The nature of the contribution of insulin to carbohydrate metabolism is as yet not entirely clear, although its action in promoting the deposition of glycogen in the muscle and in inhibiting the new formation of dextrose from protein appears definite. It seems likely that the former function is responsible for the lowering of the blood sugar in the usual clinical insulin sensitivity tests.<sup>20</sup> To demonstrate abnormal sensitivity to insulin, we believe that a comparison of a simple dextrose tolerance test with a later similar test accompanied by a subcutaneous injection of  $\frac{1}{4}$  unit of insulin per kilogram gives the most satisfactory results in infants. This test has several advantages over others commonly employed. In the first place, it eliminates the need for intravenous injections, which in infants are both difficult and disturbing. In the second place, it does not induce hypoglycemia,

19 Bridge E. M. Bull. Johns Hopkins Hosp. 61: 349-357, 1937.

20 Bridge E. M. and Winter E. A. Bull. Johns Hopkins Hosp. 64: 257-272, 1939.

which in turn stimulates the adrenergic-sympathetic mechanism for dextrose formation from liver glycogen. The results obtained by this technique give, we believe, a more accurate picture of insulin sensitivity and in addition the test is easy to perform.

To test the mechanism that controls the supply of dextrose to blood and tissue is by no means simple, but some help may be obtained in the following two ways. (a) The function of glycogen breakdown to form dextrose can be evaluated roughly from the action of epinephrine in raising the blood sugar level. If the liver contains little or no glycogen as in starvation, or if the glycogen is abnormally stable as in glycogen disease, epinephrine induces little or no rise in blood sugar. Under ordinary conditions, however, in which liver glycogen is at a normal level, the subcutaneous injection of 0.03 cc ( $\frac{1}{2}$  min.) per kilogram of a 0.1 per cent solution of epinephrine to infants gives a rise in blood sugar level similar to that obtained in a dextrose tolerance test. (b) When glycogen reserves are no longer available, it is well known that protein is broken down to form dextrose. A simple test of this function is to observe the ability of the individual to maintain a normal blood sugar level during starvation. Healthy infants do not show hypoglycemia after a fast of twelve hours but may if the fast is continued for twenty-four hours. In contrast to this, infants who have some difficulty in forming dextrose from protein will show hypoglycemia after twelve hours and in some instances after only five hours without food. Thus in infants the epinephrine test and the control of the blood sugar level during fasting offer means of evaluating another phase of carbohydrate metabolism.

As an additional test of the carbohydrate aspects of liver function, levulose and galactose tolerance tests have been employed. Normally these sugars are converted into dextrose and deposited as glycogen so rapidly that only a small amount passes through the liver to increase the blood sugar level. Various procedures for the test have been tried in the past. The technique that we have found satisfactory for infants is to give 1 Gm. of levulose per kilogram under the same conditions as in the dextrose tolerance test and to follow the blood sugar similarly. With infants the galactose test has been found so variable as to be of little value. The levulose test, however, appears satisfactory, although it has limitations. For example, if the fasting blood sugar value is abnormally low, the total glycemic response (which includes both levulose and dextrose) is unusually high and no conclusions can be drawn from the curve. This difficulty, however, can be overcome by the recent procedure of Thompson and Wilkinson,<sup>16</sup> who measure the actual concentration of blood levulose. The levulose tolerance test has been found useful as an index of liver function in a variety of diseases.

#### SUMMARY

A group of normal infants has been studied in order to standardize more satisfactorily the various tests of carbohydrate metabolism. The following techniques can be recommended for children under the age of 2 years.

(a) Preceding diets: normal caloric intake and normal proportions of fat, carbohydrate and protein for several days. The tests should not be repeated at intervals of less than five days.

(b) Fasting period: twelve hours for infants receiving three, four or five feedings a day, nine hours for premature and those receiving six or more feedings.

(c) Dextrose tolerance test: a test dose of 3 Gm. of dextrose per kilogram of body weight.

(d) Intravenous dextrose tolerance test: 1 Gm. of dextrose per kilogram in 50 per cent solution given over a period of two to four minutes.

(e) Insulin sensitivity test:  $\frac{1}{4}$  unit of regular insulin per kilogram given subcutaneously ten minutes after the ingestion of 3 Gm. of dextrose per kilogram is begun. A control test without insulin is necessary for comparison.

(f) Epinephrine test: 0.03 cc ( $\frac{1}{2}$  min.) of a 0.1 per cent solution of epinephrine hydrochloride per kilogram given subcutaneously.

(g) Levulose tolerance test: 1 Gm. per kilogram.

## THE TREATMENT OF PRIMARY DYSMENORRHEA WITH ESTRIOLE GLYCURONIDE

A CONTROL STUDY

RUTH E. BOYNTON, M.D.

AND

NORA WINTHER, M.D.

MINNEAPOLIS

The treatment of essential dysmenorrhea has been one of the most difficult problems for the gynecologist. So little is known of the cause or causes of painful menstruation that methods of treatment that have been used have been almost entirely empirical. Until the past few years, when great advances have been made in our knowledge of the relation of the endocrine glands to the menstrual function, the treatment of dysmenorrhea has consisted largely in the use of analgesics or sedatives, antispasmodics or surgery. More recently, with preparations of ovarian and sex stimulating pituitary hormones available, numerous reports have appeared in the literature on the efficacy of various endocrine preparations in relieving dysmenorrhea. Many investigators have reported encouraging results with the administration of estrogenic substance, particularly to women in whom the uterus was found to be small anteverted and hard. Other investigators, notably Novak, have advanced the theory that estrogen, which experimentally has been shown to increase the contraction of uterine muscles, is not as logical a therapeutic agent in the treatment of menstrual pain as is progesterone, which experimentally inhibits uterine contraction. Good results in the treatment of dysmenorrhea have been claimed with both estrogen and progesterone. More recently experimental and clinical studies have shown that testosterone propionate will reduce uterine contractions and in certain cases prevent dysmenorrhea. In all these reports, however, one is impressed with the fact that few attempts have been made to evaluate the results of the various endocrine preparations by a controlled clinical study. It seems especially important in evaluating the effects of any treatment for a condition such as dysmenorrhea, in which the psychogenic factor has long been recognized as exceedingly important, to control carefully the results of any therapeutic agents used.

This study presents the results of the treatment of dysmenorrhea in a group of 100 girls, 50 of whom were given estriol glycuronide extracted from human

From the Students' Health Service, University of Minnesota. This study was carried out with the aid of a grant from the Medical Research Fund of the University of Minnesota.

placentas and 50 a placebo.<sup>1</sup> Estriol glycuronide (emmenin) was first announced by Dr I B Collip as an alcohol soluble ether insoluble substance present in acetone extract of human placentas active orally and partially estrogenic in immature rodents with intact ovaries, though relatively inert in ovariectomized animals. Collip concludes that, since emmenin is ineffective in the castrate it functions directly or indirectly by stimulation of the intact ovary thus differing from estrogen. However its primary effect is estrogenic in character. Campbell and Collip<sup>2</sup> in 1930 reported 36 cases of dysmenorrhea in which estriol glycuronide was administered, with 26 cases showing definite improvement. There were no controls. Several similar reports have appeared in the literature during the past eight years. Goldberg and Lisser<sup>3</sup> in 1935 reported 40 cases of dysmenorrhea in which estriol glycuronide was administered. The estriol glycuronide failed utterly in 8 cases was of doubtful value in 7, produced definite improvement in 12 and achieved brilliant results in 13. In other words in 25 of 40 cases or over 60 per cent either entire relief or pronounced improvement was obtained.

The group of 100 young women included in this study were all students at the University of Minnesota ranging in age from 17 to 25 years. Each student was given a general physical examination, including an estimation of the hemoglobin, a basal metabolism test and a pelvic examination. No cases were included in which any pelvic abnormality was noted. All were considered cases of primary dysmenorrhea. In order to rule out any psychic effect of the treatment, a prescription for "dysmenorrhea tablets" was given to each patient. The pharmacy then dispensed estriol glycuronide tablets and a placebo tablet identical to the estriol glycuronide tablet in appearance to each alternate student. The estriol glycuronide results obtained were recorded by us with no knowledge of which of these tablets the patient was taking. The estriol glycuronide tablets which were furnished us at the time were not quite equivalent to 1 drachm (4 cc) of the liquid estriol glycuronide. We therefore gave each patient 6 tablets daily. The tablets were given for ten days before the calculated menstrual period. All patients were treated

plete relief from menstrual pain. All of the patients in both the therapeutic and the placebo groups had complete relief the first period after taking the medication and were free from pain every period while under treatment. Nine of the 10 students in this group reported that they have had no recurrence of symptoms since the onset of treatment, which is a period of nine to twelve months. The 1 student who had a recurrence of symptoms after discontinuing her medication wrote to us for a copy of her prescription. She had been unable to be up on her feet the first day of her menstrual period prior to medication but had complete

TABLE 2—Results

|                     | Total Number | Complete Relief |    | Partial Relief |    | No Relief |    |
|---------------------|--------------|-----------------|----|----------------|----|-----------|----|
|                     |              | No              | %  | No             | %  | No        | %  |
| Estriol glycuronide | 50           | 6               | 12 | 18             | 36 | 26        | 52 |
| Placebo             | 50           | 4               | 8  | 17             | 34 | 29        | 58 |

relief while on treatment. Her record disclosed that she had been taking the placebo tablets. This illustrates the difficulty encountered in evaluating results from any type of medication for dysmenorrhea.

Eighteen of the 50 on estriol glycuronide and 17 of the 50 on the placebo tablets obtained partial relief from the medication. Thirteen of those taking estriol glycuronide in this group had complete relief the first period after treatment but did not have consistent benefit during subsequent periods. Some periods were free from pain while in others the medication produced no effect. In 4 of the group on estriol glycuronide, no benefit was obtained the first period after treatment but there was complete relief the second period while under treatment. In the group classified as obtaining partial relief who were taking the placebo tablets, 12 were free from pain the first period after taking the medication and 4 had no benefit the first period but definite relief the second period. As with those on estriol glycuronide, there was no consistency in the effects of the treatment during subsequent periods. All of these were followed from nine to twelve months after the onset of treatment.

Twenty-six, or 52 per cent, of the group taking estriol glycuronide and 29, or 58 per cent, of those given the placebos reported no relief whatever. The results of this controlled group of cases show such a small difference between the therapeutic and the control group that one questions the earlier reports on the benefit of estriol glycuronide in the treatment of dysmenorrhea in studies which have not been so controlled. Although the results of this study are negative, they show the importance of controlled clinical studies in the evaluation of therapeutic agents, particularly in a condition in which there is a known psychogenic factor.

## SUMMARY

In a controlled study of the use of estriol glycuronide in the treatment of dysmenorrhea, the subjects were 100 unmarried young women between the ages of 17 and 25, all with primary dysmenorrhea. Fifty of the group were given estriol glycuronide tablets, and the other 50 were given placebo tablets indistinguishable from the estriol glycuronide tablets.

Twelve per cent of the group receiving estriol glycuronide and 8 per cent of the group receiving placebos reported complete relief from dysmenorrhea for a period of nine to twelve months. Thirty-eight per cent of

TABLE 1—Duration of Treatment

|  | Total No of Cases | 3 Mo | 4 Mo | 5 Mo | 6 Mo | 7 Mo |

for at least three months and observed either personally or by letter for about one year. The patients were divided into three groups: those who experienced complete relief, those who had partial relief and those who had no benefit whatever from the medication. Table 1 shows the number of months the treatment was continued in each of the three groups.

Six of the 50 taking estriol glycuronide tablets and 4 of the 50 taking the placebo tablets reported com-

<sup>1</sup> The placebo tablets were furnished through the courtesy of the Ayerst McKenna Company.

<sup>3</sup> Goldberg, Minnie B and Lisser Hans. On the Clinical Use of Emmenin. *Endocrinology* 19: 649 (Nov Dec) 1935.

At three weeks post partum, the specimen showed completely regenerated endometrium, with a few mitotic figures, proliferative glands with some subnuclear vacuolization and pseudostriatification. Stroma is dense.

At four weeks post partum, there was no essential change except that more definite proliferative activity was noted.

Fig. 5—Thirteen day postpartum mucosa. Mucosal surface is completely undifferentiated, dense without cellular infiltration. Glands are simple.

At five weeks there was definite evidence of renewed secretory activity, suggesting that the patient had ovulated recently. There was still present some hemosiderosis, however.

At six weeks the patient showed mild proliferative activity and evidence of old hemorrhage was still present.

At twelve weeks post partum, the patient showed twenty-three to twenty-four day secretory endometrium, pointing out that, despite continued lactation, she had ovulated and was due to have a period shortly. This she did have.

At fourteen weeks post partum, another lactating patient showed only mild proliferating activity, indi-

Fig. 5—Biopsy specimen from a fourteen week postpartum lactating patient demonstrating complete repair of the mucosal surface, but the endometrium is arrested in mildly proliferating phase.

cating that ovulation was still withheld even at this late date (fig. 5).

Apparently, then, patients who are lactating regenerate the endometrium at approximately the same rate as the nonlactating patients. However, if ovulation is inhibited, as by continued lactation, the endometrium

tends to remain as resting or mildly proliferating endometrium, until at last the previous ovarian rhythmicity breaks through.

#### REGENERATION OF THE UTERINE MUCOSA FOLLOWING SPONTANEOUS ABORTION

An effort was made to follow 9 cases of spontaneous abortion in the first trimester of pregnancy by biopsies at intervals following abortion until ovulation and menstruation could be proved histologically. In these cases specimens for biopsy were taken three days after the abortion, again at seven days and then at weekly intervals until menstruation occurred. Four of these cases will be presented in some detail to illustrate the variations possible in the process of regeneration and the factors which may influence the rate of regeneration. The remaining 5 cases fall into one of these four groups.

CASE 1—Mrs. B. M., aged 37, a decipara, had had two previous nonconsecutive abortions. At six weeks she passed a pathologic ovum consisting only of intact ovisac without evidence of cord or embryo. She was curetted immediately to remove all loose tissue, of which there was but a slight amount—the decidua having separated with the ovisac. Biopsy on the third postpartum day showed acute polymorphonuclear leukocytic infiltration of early decidua, which consisted mostly

Fig. 6 (case 1)—Biopsy twenty one days after spontaneous abortion in which curettage was done immediately. Early secretory endometrium. Patient has ovulated and she menstruated twenty eight days after abortion, or seven days after this specimen was taken.

of glands and fibrotic basal stroma. There were many thrombosed vessels present. Biopsy taken on the seventh day showed complete regeneration of the mucosal surface and glands which were numerous and slightly tortuous, showing some mitoses. There was beginning subnuclear vacuolization. Stroma had regressed to dense nuclei, with no evidence of decidual change.

On the fourteenth day biopsy showed the endometrial phase continuing as described. On the twenty-first day there was definite early secretory activity in the glands, demonstrating ovulation (fig. 6). Dating was that of early secretory endometrium. Biopsy taken on the thirtieth day, two days after a normal period began, showed menstruating endometrium but as well an unchanged strip of mildly proliferating lower segment endometrium. The latter is notorious, however, for failing to mirror the cyclic changes found in the upper segment, so that it may be discounted.

Here, then, is a patient who had a spontaneous abortion of a pathologic ovum at six weeks, was immediately curetted and had endometrial regeneration complete within seven days, ovulating on approximately the fourteenth day and menstruating on the twenty-eighth day. She continued thereafter on her previous twenty-seven to twenty-eight day cycle.

CASE 2—Mrs I G, aged 18, a primipara, passed at four months a blighted ovum of approximately two and one-half months growth, the embryo macerated and showing multiple congenital anomalies as well as intrauterine amputation of a leg. The patient was not curetted, as all products of conception were identified.

Biopsy on the third day showed only necrotic decidua without evidence of regeneration. On the seventh day there were noted regenerating basal glands compact stroma, probably basal with middle and superficial regression as well as degenerating decidua and with complete regeneration of the surface epithelium. On the fourteenth day was noted resting endometrium, completely regenerated but slight proliferative activity with no mitoses. On the twenty-first day there were no mitoses, certain areas suggested late proliferation, but in other areas there was still local and diffuse necrosis, suggesting (as was confirmed by the thirty-five day biopsy) that some placental or decidual tissue was retained, that possibly a chronic endometritis was present and that ovulation had not taken place.

On the twenty-eighth day there was no change from the picture on the twenty-first day. On the thirty-fifth day the patient flowed (one pad of bright blood) and complained of cramps. Biopsy at this time showed regressing decidua (fig 7). Flow was not menstrual-like. Immediately after this biopsy, on the thirty-sixth day the patient flowed (four to six pads) and had cramps. This continued for six days. A biopsy was again taken on the fifty-third day. This specimen showed no inflammation, but there was still some predecidual reaction with stromal edema. The patient did not return until the one hundred and seventeenth day, at which time she requested an examination to determine whether she was pregnant. She was found to be for biologic tests were positive, although the uterus had not yet begun to enlarge.

In this case, curettement after spontaneous abortion of a blighted, pathologic embryo was not carried out and regeneration of the superficial epithelium was again complete by the seventh day. However, possibly owing to retention of placental or decidual tissue or because of low grade infection, she failed to ovulate for at least two months after the abortion. Endometrium was restrained as resting or proliferating endometrium with focal areas of continued predecidual change with chronic

Fig 7 (case 2)—Biopsy thirty-five days after a spontaneous abortion in which curettement was not immediately done. Specimen elsewhere shows areas of still regressing decidua with chronic cellular infiltration. This slide shows resting endometrium with no evidence of secretory activity and with chronic inflammation present.

infiltration of inflammatory cells. Ultimately she did ovulate, but presumably at least three months after the abortion.

CASE 3—Mrs I G, aged 35, a secundipara who had had one abortion a year before, at eleven weeks began to bleed following a fall. Over the next three weeks she was given three successive courses of progesterone therapy, the last being 10 mg

of corpus luteum substance daily for seven days. Two days after the completion of therapy she began to bleed again. Definite tissues were not passed at any time, although all pads had been inspected. Immediate curettage was performed, but scant tissue was removed. A specimen for biopsy was taken nine days after the abortion, showing endometrium from the upper segment with a strong decidual reaction, glands were

Fig 8 (case 3)—Biopsy specimen nine days after abortion in case in which curettement was done after heavy progesterone therapy had been given to continue a blighted ovum. There is still adherent necrotic decidua, some placental site with maintenance of secretory glands of pregnancy. There is no evidence of reparative activity.

secretory and well preserved. There were foci of necrosis and infiltration of inflammatory cells throughout. Seen also was a well preserved placental site (fig 8). Biopsy was not done again, but she failed to have a period for nine weeks. Since then, her periods have been grossly irregular, whereas her previous catamenia had followed regular cycles.

This case may point out one of the possible hazards of heavy progesterone therapy, for involution and regeneration seemed to have been retarded, if this case is compared with case 1 (menstruation at twenty-eight days after spontaneous abortion with immediate curettage).

CASE 4—Mrs A B, aged 30, a quartipara, had two previous nonconsecutive abortions. At eleven weeks the patient passed a pathologic ovum, which contained neither cord nor embryo, of an estimated size of six and one-half weeks. Biopsy taken immediately after the abortion procured a strip of endometrium from the upper segment which demonstrated that the necrotic decidual cast was undergrown by repairing and proliferative endometrium. This process had started apparently before the actual abortion had taken place.

#### COMMENT

These sequences of endometrial regeneration emphasize the therapeutic values which emerge. It would seem, as many writers have said, that the average postpartum patient is safe from pregnancy until ovulation recurs, which takes place on an average about six weeks after delivery. Four of the 5 nonlactating convalescent patients menstruated eight weeks after delivery—about 80 per cent in this small group. In the case of the lactating patient, menstruation is delayed for varying periods of time, but from the eighth week on the ovarian cycle may escape from pituitary inhibition and render the patient susceptible of pregnancy. Certainly, prolonging the lactation period will not be a wholly effective contraceptive measure. Conversely, for the patient anxious for reimpregnation, procreative activities may begin at will. Usually the tenderness has left the postepisiotomy perineum just before ovulation takes place in the nonlactating woman.

Of much more significance is the sequence following abortion. From the study of the 4 cases cited and 9 cases followed after spontaneous abortion, it would seem that in the ideal case of spontaneous abortion ovulation occurs within the first two to three weeks after abortion. There is no endometrial evidence submitted that this is not as good a time for impregnation as any other. Reid<sup>3</sup> has employed this period to great advantage in 4 cases of "chronic aborters." Our personal experience extends to 3 other cases in which impregnation occurred before the first period following abortion. This may save valuable time for the older patient hastening before the shadows of diminished ovarian function.

Equally striking is the fact that curettage may be worth while even though all products are identified as passed. As in case 1 in which curettage was done immediately regeneration was prompt and ovulation took place some fourteen days after the abortion. In case 2 in which curettage was not done, regeneration and ovulation were delayed at least nine weeks, possibly by retained fragments of placenta or decidua or by chronic infection. No harm can be demonstrated in routine, gentle curettage. In many cases, because one cannot be certain that all tissues have passed, curettage is done. This would seem to guarantee that all morsels of the detached ovum have been removed, thus allowing uninhibited regeneration to take place at maximum speed.

True every one is familiar with the fact that placental polyps are not incompatible with a series of normal periods. Equally true is such a condition as that cited in case 4, in which even before the necrotic decidual slough separates repair is nearly complete. However, for certainty of removal routine curettage is advised.

#### CONCLUSIONS

1 Routine curettage is recommended in cases of spontaneous abortion, even though all products of conception have been identified as extruded.

2 The effect of heavy doses of progesterone in the treatment of threatened abortion is possibly that of delaying endometrial regeneration.

3 Patients may be urged to seek impregnation within two weeks after spontaneous abortion. Unless maternal health has been impaired seriously by the abortion, there are apparently no dangers of such a quickly imposed pregnancy.

4 Following normal full term pregnancy, the patient is susceptible of impregnation after six weeks, although lactation may inhibit ovulation for a longer period of time.

3 Reid, D. E. Personal communication to the authors.

**Not Enough Imagination**—The simplest proposition in the social field today is that our people shall not go hungry. If we could kill ten million unemployed this year, another group of unemployed would exist next year. Something produces unemployment. While we are finding it and correcting it we must feed the victims. On that simple principle a great many other facts and actions depend. That is why I would call it a fundamental principle. Happily all can agree to it. We disagree only as to next steps. Science may find a way to make those steps more sure. Business may find a way. Government may find a way. All three may combine to find a way. It has been suggested and even attempted to combine these three groups of agencies but never with enough imagination or enough reliance on scientific method.—Bowman, Isaiah. Enduring Purpose, *Assn. Am. Coll. Bull.* 26 194 (May) 1940.

## INTRASPINAL OPERATIONS IN COMPENSATION CASES

ARTHUR ECKER, M.D.

SYRACUSE, N. Y.

In the past seven years there has been rapid progress in knowledge concerning intractable low back and sciatic pain due to intraspinal pressure on the nerve roots. The lesions are intraspinal protrusion of the intervertebral disk, thickening of the ligamentum flavum, or both. Whereas the scientific aspects of these cases have been adequately reviewed elsewhere,<sup>1</sup> this paper is being presented to emphasize the features of the management of such operable intraspinal lesions which have to do with workmen's compensation.

For best results, cooperation between the insurance carrier and the responsible surgeon is essential. However, many managers of insurance companies have had the impression, based perhaps on unfortunate experiences with osteoplastic and other spinal operations, that any spinal operation is rarely successful in a compensation case. It is natural that these men, in all sincerity, have urged injured workmen to avoid any spinal operation whatsoever. It is hoped that this paper will help clarify these problems and result in progress toward the common goal of all who deal with compensation cases, namely the prompt and permanent relief of disability.

#### CLINICAL MATERIAL

The incidence of these symptoms and the frequency with which operation has been performed may be illustrated by the following facts. In the past two and a half years 158 patients were examined because of low back and sciatic pain. Of this group it was suspected that 108 had an intraspinal lesion. Spinograms were performed in 50 cases and operation in 38 cases in which intractable low back and sciatic pain had not responded to prolonged nonoperative orthopedic management, which usually included a period of three weeks of complete bed rest. Of those patients who underwent operation at least four months ago, there were 12 who claimed that their disability was compensable. The management and end results of this complete series of 12 cases represent the gist of this report.

In this series there were 10 men and 2 women, who ranged in age between 29 and 53 years. The preoperative duration of symptoms varied from three months to fourteen years, averaging thirty-four months. The amount of time lost from work before operation ranged from two to sixty-three months, with the exception of 1 man who did office work and who had lost only three weeks from work although he had been suffering for over two years. All patients underwent operation between Oct. 27, 1939 and Oct. 10, 1941.

#### METHODS OF DIAGNOSIS AND TREATMENT

It is now established that most cases of prolonged severe sciatic pain are due to mechanical irritation of the nerve roots. The diagnosis of intraspinal pressure on nerve roots (probably intraspinal protrusion of the intervertebral disk, thickening of the ligamentum flavum, or both) was usually made on a clinical basis, that is, entirely on the history and physical examination.

Abridgment of a talk given to the Syracuse Claim Association on Oct. 6, 1941.  
From the Syracuse University College of Medicine and the Syracuse University Hospital.  
1 Bradford, F. K., and Spurling, R. G. The Intervertebral Disk. Springfield, Ill., C. C. Thomas, 1941.

The most common symptoms and signs were history of onset while bending forward or straining early development of backache later development of sciatic pain limp on the affected side, increase of pain on coughing, sneezing or bending relief of pain with bed rest, pain and limitation of straight leg raising, limitation of flexion of the lumbar spine with flattening of the normal lumbar lordosis list of back, paresthesia and sensory changes especially in the fifth lumbar and first sacral dermatome diminished or absent ankle jerk tenderness along the course of the sciatic nerve and increased total protein content of the spinal fluid The most reliable sign of the exact level of the lesion was localized tenderness above or below the spinous process of the fifth lumbar vertebra (and at times a little to one side) with reproduction of sciatic pain by firm thumb pressure over this site

Plain roentgenograms of the spine were used only in order to exclude other lesions although a diminished intervertebral space above or below the fifth lumbar vertebra is suggestive of a protruded disk Pneumograms of the lower spinal canal were made primarily to exclude a lesion above the level of the fourth lumbar vertebra and to obtain spinal fluid for laboratory study Incidentally, it was determined whether root pain was produced with each injection of air Occasionally the pneumogram itself helped convince the doctors representing the insurance company of the nature of the lesion and made for a more harmonious management of the case In 1 case the pneumogram seemed normal, and operation was unnecessarily delayed Such apparently normal pneumospinograms occur especially when the lesion is at the lumbosacral space, where there is plenty of room for an intraspinal lesion to be present between the vertebral pedicle and the dural sac without distorting the latter Iodized oil was not used in any case because of the possible psychologic effect of the presence of this oil in the spinal canal or along the nerve roots, as shown in subsequent x-ray films When one needle was used to inject the air as well as to obtain the spinal fluid, the pneumograms were only of limited value, as described However, the use of two spinal needles may yield more complete filling of the dural sac Furthermore, oblique views should yield a greater percentage of positive spinograms It is important to emphasize however that, when a definite clinical diagnosis has been made the presence of an apparently normal pneumospinogram should not contraindicate surgical treatment

In order to relieve intraspinal pressure on the nerve roots, it is usually necessary to remove the thickened ligamentum flavum, intraspinal protrusions of the intervertebral disk, or both In all these compensation cases, laminectomy of the fifth lumbar vertebra was performed Laminectomy of the one vertebra permits exploration of the intraspinal surface of the intervertebral disk both above and below the fifth lumbar vertebra on both the right and left sides The skin incision is usually  $2\frac{1}{2}$  inches long<sup>2</sup>

#### OPERATIVE FINDINGS AND POSTOPERATIVE MANAGEMENT

In 1 case there was found only thickened ligamentum flavum, in 2 cases only intraspinal protrusion of the intervertebral disk in 8 cases both thickened ligamen-

tum flavum and protruded intervertebral disk and in 1 case there was found congenital shortness of the dural sac All the lesions were immediately above or below the fifth lumbar vertebra In 1 case there was a protruded intervertebral disk at the fourth lumbar interspace and also thickening of the ligamentum flavum at the lumbosacral interspace

The articular facets were not disturbed and the dural sac was not opened in any case In the protruded disk was small and had not torn through the posterior longitudinal ligament it was not removed, however, the nerve root was decompressed by adequate removal of lamina and ligamentum flavum By leaving the posterior longitudinal ligament (and perhaps some strands of annulus fibrosus) intact, risk of recurrence of intraspinal protrusion of another portion of the disk was minimized After laminectomy was performed the patient was kept in bed ten days and in the hospital twenty-one days after operation It was considered important not to prescribe a corset or brace in these cases because their use implies a weakness of the back and tends to undermine the patient's confidence in the strength of his back Most patients were not permitted to return to their full time regular work until three months had elapsed after they had been dismissed from the hospital However it was found advisable to allow patients to return to light part time work after the second month

When the time came to return to work, most patients became very nervous and apprehensive and required considerable reassurance Frequently the sympathetic encouragement of the patient's spouse was of great assistance In 2 cases amphetamine sulfate in doses of 5 mg was prescribed for fatigue

#### RESULTS

Every patient seems to have been promptly and permanently relieved of severe pain No patient suffered any permanent ill effect from the operation Except for patients 5 and 8, all returned to their regular work within four months after operation The occupations represented were, in order, bookkeeper, truck mechanic, factory employee, office worker, laborer, linotypist, store clerk, laborer, machine operator carpenter, sales woman and salesman In a few cases there have persisted minor discomforts, such as feelings of fatigue or drawing sensations in the back and legs, especially after heavy exertion<sup>3</sup>

Of the 8 patients whose claims for compensation were promptly accepted by the insurance companies every one returned to his regular work within four months after the operation Of the 4 patients whose compensability was contested, 2 have returned promptly to their regular work Although the other 2 patients (5 and 8) admit that they have no severe pain, they have not returned to regular work They were both unskilled laborers but now refuse to do heavy work Furthermore, both are receiving as much income now as they did before they were injured As a matter of fact, 1 of these 2 is learning a new occupation by working as a clerk four hours a day without pay, and the other has applied for a light job

2 Since this report was written I have removed huge protruded disks in each of 2 additional compensation cases utilizing only a hemilaminectomy of the fifth lumbar vertebra In these cases diagnosis and localization were unusually definite In 1 case a preliminary spinogram was done and in the other not even a spinal puncture was performed Both patients have had immediate and persistent relief from severe pain

3 The latest report in each case is as follows (with time since operation indicated) twenty six months no pain at all two years no pain at all twenty two months some discomfort but no severe pain seventeen months no severe pain nineteen months no pain at all sixteen months no pain at all eleven months no pain at all seven months no severe pain seven months no pain at all seven months some fatigue but no pain five months some discomfort when tired four months no pain at all

FEATURES OF SPECIAL INTEREST FROM THE POINT  
OF VIEW OF WORKMAN'S COMPENSATION

A tear in the annulus fibrosus which results in protrusion of the disk or in the ligamentum flavum which leads to thickening is as much an accident as a tear in the ligament of the ankle. In the latter there are externally visible swelling and ecchymosis, whereas in the former the injury is deep in the body and the immediate disability may be only a slight backache. The pain caused by gradual thickening of the ligamentum flavum progressive protrusion of the intervertebral disk or both is progressive and is due to pressure on the nerve roots. Hence the sciatica may not set in for days, weeks, months or even years later. The syndrome is characterized by exacerbations and remissions. The intermittent character of the pain is purely mechanical in origin. With more pressure on the nerve roots there is more pain.

In many cases the clinical diagnosis is clear, but often it is difficult to decide when operation should take place. I believe that all reasonable orthopedic measures should be used first. At least three weeks of bed rest with or without traction on the affected leg, should be employed. Both the patient and his home physician must be convinced that nonsurgical treatment is ineffective. The patient should also have a period of time to think over the idea of operation, its risks and probable outcome and should actually request surgical intervention. Most patients are free from pain at rest, but the patient has to make a living, he should not be subjected to too long a period of suffering and rest before operation is performed. The more a person is away from his regular work the more nervous and apprehensive he is when he thinks of returning to it. On the other hand, the presence of well defined neurotic symptoms should not be an absolute contraindication of operation although it may make the prognosis somewhat guarded. I have seen many patients lose all their so-called neurotic symptoms as soon as they were relieved of long standing pain. Incidentally, it is advisable before operation to eliminate foci of infection which may be present in the teeth or prostate so as to avoid complications or delay in convalescence.

The patient should feel the sympathetic cooperation of the claim manager. This is one of the most important factors in maintaining his morale and getting him back to work. If possible all questions of compensability should be settled prior to operation. Finally, it is desirable to have the employer's cooperation in allowing the patient to return to work part time, without heavy lifting for the first month. Such cooperation allows him to regain self confidence and resume the habit of working.

## SUMMARY

Twelve patients who suffered from intractable low back and sciatic pain and who claimed that their disability was compensable underwent intraspinal operation for decompression of the nerve roots. Ten of the 12 patients were found to have a protruded intervertebral disk, with or without thickening of the ligamentum flavum, above or below the fifth lumbar vertebra. All patients were relieved of severe pain. Ten of the 12 patients returned to their regular work within four months of operation. The 2 patients who failed to return to work were among 4 the compensability of whose injuries was contested. One of these 2 patients is doing clerical work several hours daily, the other has applied for a light job.<sup>1</sup>

## CONCLUSION

Compensable intraspinal lesions (protrusion of intervertebral disks and thickening of the ligamentum flavum) which cause intractable low back and sciatic pain that fails to respond to orthopedic management should undergo operation just as in noncompensable cases. Proper selection of patients and minimal neurosurgical intervention which is adequate to decompress the nerve roots, together with the cooperation of the insurance carrier, yield excellent results, both in terms of relief of pain and in return to regular work.

THE COLOSTRUM CUTANEOUS TEST  
FOR THE DIAGNOSIS OF  
PREGNANCY

## A STATISTICAL ANALYSIS OF FIVE HUNDRED TESTS

LESTER M. GOLDMAN, M.D.

HENRY B. KESSLER, M.D.

AND

MILDRED E. WILDER, A.B.

NEWARK, N. J.

In a recent paper by Falls, Freda and Cohen<sup>1</sup> a cutaneous test based on the intradermal injection of human colostrum was described.

The theoretical background for the test was based on sensitivity to the colostrum substances during the nonpregnant state and absence of sensitivity during pregnancy.

## TECHNIC

The technic of the test in our study and the source of material utilized were made to conform as closely as possible to that of the original paper. Colostrum was obtained from primiparous pregnant women after at least twenty-eight weeks of pregnancy. The material was diluted to twice its volume with sterile isotonic solution of sodium chloride, and merthiolate solution was added as preservative.

One-fiftieth cc of dilute colostrum and a similar quantity of isotonic solution of sodium chloride as a control wheal were injected intradermally in adjacent areas. Reactions were read at intervals of ten, thirty and sixty minutes. A papular elevation without pinkish areola was considered negative (positive reaction for pregnancy of Falls, Freda and Cohen). A pink areola of less than  $\frac{1}{4}$  inch diameter was considered a 1 plus, of  $\frac{1}{2}$  inch diameter 2 plus,  $\frac{3}{4}$  inch diameter 3 plus and an areola of 1 inch or more diameter with pseudopodic manifestations a 4 plus reaction. All reactions 2 plus or greater were considered positive reactions (so-called nonpregnancy result).

## SOURCE OF MATERIAL

Persons selected for testing were chosen from the private practice and the various clinics of the Newark Beth Israel Hospital, consisting of a group of antepartum patients in various stages of pregnancy, a large group of endocrine patients, both male and female, and control groups of both normal and nonendocrine medical conditions among children, men and women. An analysis of the incidence of the various persons tested will be found in table 1.

From the Laboratories and Obstetrical Services of the Newark Beth Israel Hospital.  
1 Falls, F. H., Freda, V. C. and Cohen, H. H. Skin Test for Diagnosis of Pregnancy, *Am J Obst & Gynec* 41: 431 (March) 1941.

<sup>1</sup> Love, J. Grafton. Treatment of Protruded Intervertebral Disks, *Minnesota Med* 23: 692 (Oct.) 1940.

Persons 12 years of age or less were considered to be children. All patients diagnosed as endocrine on the basis of glandular stigmas, menstrual disturbance or menopausal phenomena and all other persons receiving endocrine therapy in any form were included in the endocrine disturbance groups. The pregnant patients varied from four weeks to forty weeks gravid. The postpartum group included all cases less than six months after delivery.

Among the nonendocrine, non-normal groups were cases of idiopathic sterility, anemia, cervical polyp, fibroids, anal fissures, hypertension, vaginitis, cystitis, habitual abortion, appendicitis, respiratory infections and heart disease.

The normal subjects consisted of resident physicians, laboratory technicians and general hospital personnel. In each instance a careful history was obtained to rule out the presence of either endocrine or nonendocrine disturbances.

#### FINDINGS

Of the total antepartum cases examined, comprising a group of 185 tests, 131, or 70.8 per cent, showed a negative reaction indicative of pregnancy, while 54, or 29.2 per cent, showed a positive reaction. It is interesting to note that among those giving a correct response

TABLE 1—Persons Tested

| Diagnosis               | Number of Cases | Percentage of Cases |
|-------------------------|-----------------|---------------------|
| Antepartum              | 185             | 37.0                |
| Nonpregnancy            | 315             | 63.0                |
| Normal and nonendocrine | 153             | 50.6                |
| Girls                   | 8               |                     |
| Boys                    | 12              |                     |
| Women                   | 93              |                     |
| Men                     | 40              |                     |
| Endocrine disturbances  | 122             | 29.4                |
| Girls                   | 4               |                     |
| Boys                    | 8               |                     |
| Women                   | 110             |                     |
| Men                     | 10              |                     |
| Postpartum              | 30              | 6.0                 |

the period of gestation varied from nine to thirty-nine weeks with an average of twenty-seven and six-tenths weeks. On the other hand, those showing an incorrect response varied from four to thirty-nine weeks with an average of twenty and five-tenths weeks. The average period of gestation appears to be somewhat shorter among those showing the false reaction.

In the postpartum group of 30 tests there were 17 correct reactions, or 56.6 per cent, and 13 incorrect, or 43.4 per cent. Here the average period following delivery was slightly smaller for the group of correct reactions. The period post partum among this group varied from three to twenty-six weeks with an average of eight and five-tenths, while that among the incorrect group varied from five to twenty-two with an average of nine and three-tenths weeks. It appears that the test may be less accurate in the first six months following pregnancy than during the period of gestation.

In the control groups composed of nonpregnant, non-endocrine cases, the total number of tests performed was 153. Among these were 40 men showing the non-negative reaction, an incidence of 75 per cent, 93 women showing a correct reaction in 65.6 per cent of cases, 8 girls with a correct incidence of 50 per cent and 12 boys with an incidence of 66.6 per cent. The total number of correct reactions among this group was 103, or 67.3 per cent. It is interesting to note that the per-

centage of correct responses among the normal males was distinctly higher than that of the females (73.1 per cent to 64.3 per cent). In the subjects classified as nonpregnant endocrine patients the total number of tests performed was 132, of which 89, or 67.4 per cent, were incorrect. Among these the women showed the

TABLE 2—Correct Reactions

| Diagnosis       | Total Number | Number Correct | Percentage Correct |
|-----------------|--------------|----------------|--------------------|
| Antepartum      | 185          | 131            | 70.8               |
| Postpartum      | 30           | 17             | 56.6               |
| Control men     | 40           | 30             | 75.0               |
| Control women   | 93           | 61             | 65.6               |
| Control boys    | 12           | 8              | 66.6               |
| Control girls   | 8            | 4              | 50.0               |
| Endocrine men   | 10           | 8              | 80.0               |
| Endocrine women | 110          | 75             | 68.1               |
| Endocrine boys  | 8            | 7              | 87.5               |
| Endocrine girls | 4            | 2              | 50.0               |
| All women       | 415          | 260            | 62.9               |
| All men         | 50           | 38             | 76.0               |
| All children    | 22           | 22             | 100.0              |
| Total tests     | 487          | 320            | 65.9               |

greatest error (35.5 per cent). The men showed only 20 per cent error, the girls 25 per cent and the boys only 12.5 per cent.

An analysis of the incidence of correct reactions among the various groups is found in table 2. It should also be noted that the expected reactions in the entire group of women and also among the pediatric cases were somewhat less than that in the total group of men, also that the apparent efficiency of the test based on the total average incidence of correct reactions is only 65.9 per cent.

Since women at the child bearing age or during the early stages of the menopause make up a large percentage of the cases which are diagnostic pregnancy problems, the efficiency of any pregnancy test would necessarily depend on the accuracy of the test in this group of patients. An analysis of the group in our series, comprising a total of 110 cases, shows a correct incidence of approximately that found in any other group. It was observed that in the cases of idiopathic

sterility, which consisted of only eight tests, the efficiency if anything was lower than that of the entire series. The menopausal cases, which formed the greatest number in this group, are sufficiently important to justify separate analysis (table 4).

While the proportion of correct reactions in the entire group of menopausal cases was 61.9 per cent, it is

## ARTERIOVENOUS FISTULA

KENNETH I. GAMM, M.D., GALVESTON, TEXAS  
Passed Assistant Surgeon, United States Public Health Service

A critical search of the literature since Stemmann first described the use of his pin for skeletal traction in 1907 has failed to produce a report of an arteriovenous aneurysm resulting from its use. It seems amazing that some instances have not been reported when one considers the proximity of the anterior tibial artery and vein to the anterior tibial crest at

Fig. 1—Relationship of arteriovenous fistula to ankle

its distal third. The use of the Stemmann pin for skeletal traction gained popularity in this country in 1918 following the war, and further impetus to this means of traction was added by the publishing of Böhler's fracture hook in English in 1929. In the eastern part of the country traction for tibial fractures is usually obtained by a pin through the os calcis, while in our section of the country it seems to be the rule to place it through the distal end of the tibia and avoid traction through a joint.

A brief list of references to the literature is given<sup>1</sup> for those wishing to refresh their memory with the pathologic physiology of abnormal communications between the arteries and veins in the extremities.

## REPORT OF CASE

R. W., aged 44, an American seaman, on April 2, 1941, fell 12 feet down a ladder aboard his ship and sustained a fracture of the left os calcis.

From the U. S. Marine Hospital

For a number of years the patient has consumed about 300 cc of alcohol daily. He had a gunshot wound of the left hand and a bayonet stab wound of the left arm in 1918. The rest of his past history is noncontributory.

The fracture was treated in a Böhler reducing frame by means of traction with a Stemmann pin through the os calcis and countertraction through the distal third of the tibia. He was placed in a cast which encompassed the pins. This was removed at the end of six weeks. The patient alleges that there was a considerable amount of bleeding from the pin wounds in the tibia when the pin was removed. The patient returned to work in July and except for an occasional pain he had little swelling in the left ankle and foot. On August 2 he twisted his ankle, and because the pain and swelling persisted he presented himself at our hospital for treatment. Examination in the outpatient clinic of the injured ankle revealed a palpable thrill and a bruit audible with the stethoscope. He was promptly hospitalized for further study.

Physical examination revealed that the patient was well nourished and well developed. He walked with a limp and favored the left ankle.

Examination of the head, eyes, ears, nose and throat was noncontributory except for pyorrhea alveolaris.

The chest was asthenic with retracted clavicular spaces. Respiration was free and at the rate of 18 a minute. The lungs were essentially normal on percussion and auscultation.

The heart was not enlarged to percussion, and a teleroentgenogram revealed no increase in size. There were no murmurs and the rhythm was regular. The blood pressure was 160 systolic and 94 diastolic. The pulse was full and rapid 118 a minute.

Fig. 2—Arteriovenous aneurysm at operation

The abdomen was essentially normal, as was the genito-urinary system.

Examination of the extremities was noncontributory except for the left lower leg. There was moderate edema about the left ankle extending over the dorsum of the foot. He had a complete range of motion in the left ankle but alleged pain on all motion. Inversion and eversion particularly caused pain in the subastragalar joint. There was some widening of the os calcis with a piling up of bone beneath the fibula. There

was a palpable thrill along the anterior tibial region lateral to the crest 8 cm above the ankle joint, with systolic accentuation. Over this area a systolic accentuated bruit was audible throughout the cardiac cycle. The foot was warm and moist. The dorsalis pedis artery and the posterior tibial artery were pulsating.

Fig 3—Vein ligated with arteriorrhaphy completed

On compression of the pulsile mass or compression of the anterior tibial artery above, the thrill and bruit disappeared. A modified Branham's bradycardia phenomenon was present. After the fistula was occluded the pulse dropped from 108 to 92, but the blood pressure failed to rise and there was no feeling of faintness or thoracic constriction.

Oscillometric and dermaterm readings with a U M A oscillometer of the Collen's type are given in the accompanying table.

A Moschowitz-Matas test revealed adequate circulation to the left foot.

Usually it is best to wait six months before having the operation after injury, but once the patient was aware of the aneurysm he was anxious to have it corrected.

Arteriograms were made with colloidal thorium dioxide but were not conclusive.

After a twenty-four hour preparation of the skin with soap packs on August 15, the anterior tibial region was exposed. The tibialis anticus muscle was retracted medially and the extensor hallucis longus and deep peroneal nerve were retracted laterally. Thus was exposed a fistulous communication of fibrous tissue that appeared to be neither vein nor artery between the left anterior tibial artery and vein. Its lumen was about 0.5 cm in diameter and its outside diameter 1 cm. There was a large amount of scar tissue about the artery and vein but the wall of the artery did not appear thinned out nor did the proximal branch appear dilated. The wall of the vein was somewhat thickened but not dilated. Photographs taken were not sufficiently detailed to publish but the semidiagrammatic drawing shows the involved area before and after repair. The fistulous tract was excised and the proximal and distal segments of the tibial vein were ligated. The anterior tibial artery was clamped with a Dieffenbach clamp and the fistulous

communication was closed with five sutures of 0000 arterial silk. When the arterial clamp was removed, the dorsalis pedis artery was again seen to pulsate, and the arteriorrhaphy was competent.

On microscopic examination the tissue consisted of a vessel wall irregularly and definitely thickened. It was composed of an irregular, dense meshwork of cellular fibrous tissue with ovoid and elongated nuclei. Some were considerably flattened and elongated. There was no definite pattern of arrangement. This wall faded imperceptibly into a denser less cellular surrounding stroma containing scattered adipose tissue and collagenous fibers. The outer surface of the specimen was covered with adipose tissue infiltrated with a few neutrophils, probably of operative origin. The vessel was lined with intima of varying thickness and not well demarcated. A few neutrophils were noted just exterior to the endothelium. A few arterioles coursing through the specimen had significantly hyperplastic walls and small lumens.

The patient was given a solution of heparin immediately and continuously in sufficient amount to keep his clotting time above fifteen minutes. This required 40,000 units a day, 10,000 units was given in 500 cc of physiologic solution of sodium chloride about 15 drops a minute by means of an 18 gage needle in the basilic vein. Owing to the oozing from the anterior tibial wound the heparin was discontinued after forty-eight hours, although we had planned on giving it for seven days.

The convalescent course was not without excitement for the patient left the hospital against advice on the fourth postoperative day. He was returned to us by the police on the twelfth postoperative day. He was in the midst of an alcoholic debauch, and his operative wound had become infected. He has been seen in the outpatient clinic since that time but never will remain long enough to permit us to do a skin graft on the granulating anterior tibial wound. When seen in November 1941, the anterior tibial artery was palpable and all the patient's complaints were referable to his postoperative wound.

#### COMMENT

This case was of particular interest owing to the fact that an arteriovenous fistula, even as small as this one proved to be, can produce mild cardiac embarrassment. Usually, unless local symptoms are present, small arteriovenous fistulas of the extremities do not warrant operative repair and may, within a year after the injury, heal spontaneously.

#### Oscillometric and Dermatherm Readings

| Oscillometric Readings | Right | Left |
|------------------------|-------|------|
| Mid thigh              | 8     | 12   |
| Above knee             | 9     | 14   |
| Below knee             | 8     | 16   |
| Calf                   | 6     | 20+  |

| Dermatherm Readings    |       |      |
| Great toe              | 38°   | 30°  |
| Instep                 | 37½°  | 39½° |
| Dorsum foot            | 39°   | 31°  |
| Inside foot            | 38°   | 39°  |
| Anterior ankle         | 30°   | 32°  |

The accepted treatment for fistulas of the anterior tibial artery and vein has been to excise the aneurysm and ligate the proximal and distal arteries and veins with all collateral communications. However, in view of the success that Murray of Toronto has had in vascular surgery since using heparin, we yielded to temptation and did a ligation of a vein with lateral arteriorrhaphy. We were fortunate in preserving the pulsation in the dorsalis pedis artery, this, we believe, justified our procedure.

## THROMBOSIS AS A COMPLICATION OF VENOGRAPHY

JON HOMANS, M.D. BOSTON

The recent introduction of venography in a number of the larger clinics suggests that the procedure may perhaps become widely used. In that case the complications to which it may give rise should be made a matter of general knowledge. With this object in view, I report an instance of severe pain and local thrombosis resulting from the introduction of a 50 per cent compound diodrast solution into the lesser saphenous vein of the leg. Records of a previous case of this kind are not available to me.

## HISTORY OF CASE

A man aged 34 had previously been well and was of a vigorous athletic type. However his father had died of pulmonary embolism and a brother had suffered a serious postoperative embolic accident from which he recovered. During the previous year the patient had experienced three attacks of acute pleuritic pain, each of which was followed after a few days by the expectoration of a moderate amount of blood. The severity of the attacks varied and the attacks themselves were not particularly characteristic of pulmonary infarction. However roentgenologic study of the chest on several occasions revealed what appeared to be pulmonary infarcts, several in the base of the right lung and one in the left. During this period the patient had not considered himself ill and had noticed no lumpiness, swelling, or cyanosis in either leg, and had it not been for his family history he might perhaps have waited considerably longer before submitting to any sort of investigation. A bronchoscopic study of the lungs and the injection of iodized oil failed to reveal any pathologic condition in the air passages. Physical examination showed no abnormalities except that forced dorsiflexion of the right foot excited a very slight discomfort high up in the heel of the calf—a positive dorsiflexion sign which was thought to mean that thrombosis had recently occurred in some of the great venous plexuses among the large flat muscles of the calf. To support this diagnosis it was thought advisable to make a venogram.

On Nov. 13, 1941 the right lesser saphenous vein posterior to the external malleolus was exposed in the usual way and a small blunt-nosed cannula tied into the vein with silk. As the patient lay on his side, 20 cc. of a 50 per cent compound diodrast solution was injected over a period of twenty seconds, that is at the rate of about 1 cc. a second after which 20 cc. of salt solution was injected through the same cannula. Within a minute after the injection the patient experienced a violent cramp in the lower leg which was so severe as to cause him to writhe. It lasted for about three to five minutes, dying out rather gradually, and was believed to be due to vascular spasm.

Late in the night and in the early hours of the next morning (the venogram was made about 4 p.m.) the patient experienced an itching discomfort in the right calf and was conscious of a tightening and swelling of the right leg. In the morning it was clear that a fresh extensive thrombosis had occurred in the deep veins of this leg. The calf had increased perhaps 2 cm. in circumference, as compared with the other leg. The foot was bluish, and the muscles felt tense and resistant. The reaction was confined to the lower leg, but a hardening along the great saphenous vein was evident, at this time entirely below the knee. Here it is pertinent to remark that the venogram gave no evidence of occlusion of the veins but did show slight irregularity in the lower part of the femoral vein as if a nonoccluding thrombus had previously been organized and had left several small irregularities in the wall of the vein. Thus the right leg was presumably the source of embolism. A venogram of the left leg for purposes of comparison was not attempted.

Because of the unexpected thrombosis, the recent pulmonary infarctions and the patient's family history it seemed advisable to divide the femoral vein at the groin in order to head off a further spread of the thrombosis and possible detachment of an embolus. The operation was performed with local anesthesia without any particular difficulty, and no thrombus was found

in the superficial femoral vein just below the profunda. Here the vein was divided. On examination of the thigh at the end of the operation it was realized that the thrombosis in the saphenous vein had progressed upward so rapidly that it had reached a point within 2 to 3 cm. of the saphenous opening. Accordingly the great saphenous vein as well was sectioned.

The patient's tendency to thrombosis appeared to have been so actively stimulated that it was decided to heparinize him. Accordingly heparin was given during the next five days by injection at four hour intervals, and the clotting time was kept between five and twenty-five minutes. The foot of the bed was elevated 6 inches to encourage an easy venous return. The patient was given a normal diet with plenty of fluids. At the end of five days, on the withdrawal of heparin, a fresh accession of thrombosis began. This showed itself in the form of a recurrence of swelling of the calf, tenseness of the muscles and blueness of the foot. It was associated with a moderate rise of temperature, but the whole process subsided fairly rapidly, and within two weeks after the operation the leg had regained a normal appearance. The patient was then able to get out of bed wearing an elastic stocking. He gradually increased his periods of activity, which brought on no swelling and no more than a moderate engorgement of the ankle and foot. However, twenty-seven days after venography the extraction, with procaine hydrochloride anesthesia, of a suppurating, impacted third molar tooth was followed by another attack of thrombosis, this time in a branch of the lesser saphenous vein directly tributary to the vessel into which the injection of diodrast had been made. There were heat, redness and soreness, but on elevation of the extremity in bed this whole process cleared up within five or six days, and the patient has since remained well.

It seems possible that a dissemination of bacteria had occurred as a result of the tooth extraction and that this caused thrombosis in a vein previously irritated by the injection of diodrast.

It is impossible to escape the conclusion that it was the introduction of the solution of diodrast which touched off, in veins which had recently been the scene of phlebothrombosis, the patient's violent acute attack. The immediate painful effect, followed within eight or ten hours by the active thrombosis itself, indicates clearly enough what happened. However, there is present in this case what might be called a thrombophilic background. There appears to be even a constitutional tendency in the patient and his family to thrombosis and embolism. This has shown itself in other members after operation, but in this patient embolism occurred without clinical signs of thrombosis and in the absence of any injury or operation whatever. The suggestion is offered, in view of the recurrence following extraction of the infected tooth, that a focal infection in some way may have influenced the thrombosing process.

The rare serious general reactions to the introduction of iodine solution are apparently at present unpredictable. Death has been known to occur in the making of a venogram with diodrast. In the case presented there was no question of any constitutional reaction for no change in the circulatory or the nervous system occurred and urticaria or edema did not follow the introduction of the solution. It must therefore be supposed that in a person susceptible to thrombosis the introduction of a 50 per cent compound diodrast solution into the lesser saphenous vein caused immediate vasoconstriction followed by thrombosis, that a local venous disorder continued for at least five days (because a recurrence followed the withdrawal of heparin) and that even twenty-seven days after the original injection of diodrast the tendency to thrombosis was still present (because there was recurrence in the vein into which the injection had been made).

Diodrast, as a 35 per cent, 50 per cent and even stronger solution is commonly introduced into the veins. It has frequently been introduced into a vein of the foot in the presence of active thrombosis without exciting any detectable reaction. The procedure is so valuable that one unfortunate but not serious accident should not be held against it. A watch should be kept for similar episodes, with an eye to their prevention.

## Council on Pharmacy and Chemistry

### REPORT OF THE COUNCIL

IN 1932 THE COUNCIL ON PHARMACY AND CHEMISTRY SET UP A SPECIAL COMMITTEE ON THE STANDARDIZATION OF CATGUT TO DETERMINE THE STATUS OF THE STERILITY OF COMMERCIAL CATGUT SUTURES AND AT THE COUNCIL'S REQUEST THE BOARD OF TRUSTEES OF THE AMERICAN MEDICAL ASSOCIATION GRANTED THE COUNCIL AN APPROPRIATION FOR A SPECIAL INVESTIGATION OF THIS PROBLEM. AS A RESULT OF THIS ACTION A REPORT ON THE SUBJECT PREPARED FOR THE COMMITTEE BY AN OUTSIDE INVESTIGATOR WAS PUBLISHED UNDER THE AUSPICES OF THE COUNCIL (BREWER JOHN H. THE PRESENT STATUS OF THE STERILITY OF CATGUT SUTURES ON THE AMERICAN MARKET J A M A 108 722 [Feb 27] 1937).

ON THE RECOMMENDATION OF THE COUNCIL'S COMMITTEE ON THE STANDARDIZATION OF CATGUT THE INVESTIGATION OF A DIFFERENT PHASE OF THE PROBLEM OF THE STANDARDIZATION OF SURGICAL CATGUT HAS BEEN AIDED IN PART BY ANOTHER APPROPRIATION GRANTED RECENTLY BY THE BOARD OF TRUSTEES UNDER THE AUSPICES OF THE COUNCIL A STUDY OF THE ABORPTION QUALITIES OF SURGICAL CAT WAS INITIATED AND CARRIED OUT BY DR HILGER PERRI JENKINS AND CO-WORKERS AT THE UNIVERSITY OF CHICAGO DEPARTMENT OF SURGERY. THE PAPER WHICH HAS BEEN PREPARED BY THESE INVESTIGATORS IS IN FOUR PARTS AND BECAUSE OF ITS UNUSUAL LENGTH IS BEING PUBLISHED IN THE ARCHIVES OF SURGERY IN FOUR CONSECUTIVE INSTALLMENTS THE FIRST OF WHICH APPEARS IN THE MAY ISSUE OF THAT PUBLICATION.

IN RECOGNITION OF THE CONTRIBUTION OF THESE INVESTIGATORS ON THIS PHASE OF CATGUT SUTURE STANDARDIZATION AND BECAUSE OF THE IMPORTANCE OF THE INFORMATION TO THE MEDICAL PROFESSION THE COUNCIL HAS AUTHORIZED PUBLICATION OF THE FOLLOWING SYNOPSIS OF THIS STUDY IN THE FORM OF A REPORT. THE COUNCIL DESIRES TO EXPRESS APPRECIATION TO THE AUTHORS OF THE PAPER AND TO THE COMMITTEE ON THE STANDARDIZATION OF CATGUT PARTICULARLY TO THE CHAIRMAN FOR HIS EFFORTS IN REVIVING THE PAPER.

ON THE BASIS OF THE DATA CONTAINED IN THE PAPER BEING PUBLISHED IN THE ARCHIVES OF SURGERY THE COUNCIL BELIEVES THE PRESENT LABELING OF SURGICAL CATGUT ON THE MARKET—PARTICULARLY WITH RESPECT TO THE LENGTH OF TIME THE CATGUT CAN BE EXPECTED TO PERFORM ITS FUNCTION IN THE TISSUES UNDER CONDITIONS OF ACTUAL USE—IS INADEQUATE AND THAT BETTER METHODS OF GRADING THE VARIOUS TYPES OF THIS SUTURE MATERIAL ARE NECESSARY AS RECOMMENDED IN THE PRESENT STUDY.

ALFRED F. SMITH, M.D., Acting Secretary

### ABSORPTION OF SURGICAL GUT (CATGUT)

The results of a recent comprehensive study by Dr H. P. Jenkins and his associates on this subject are being published elsewhere.<sup>1</sup> The observations made by these investigators are reported herewith under headings which represent the subtitles used by the authors to designate the four parts into which their paper is divided.

#### I. THE DECLINE IN TENSILE STRENGTH IN THE TISSUES

This part of the study begins by the investigators pointing out that the term "catgut as commonly applied to surgical sutures is essentially a misnomer and that the term 'surgical gut' which has been adopted by the U. S. Pharmacopoeia to designate sheep intestine prepared for surgical use is a fundamental improvement in suture terminology. It is indicated that the absorbability of this material has been the subject of some controversy from previously published observations the duration of the tensile strength of catgut in the tissues did not correspond closely to the label declaration of this material as so called twenty day chromic or forty day chromic—terms which have been used to designate the approximate absorption time.

To obtain further data concerning the problem the investigators carried out a series of fifteen hundred implants (usually made in duplicate) of 6 inch lengths of surgical gut in the abdominal muscles of dogs to test various types and sizes of this suture material as marketed by ten different manufacturers: so called plain catgut and twenty day (medium hard) chromic and forty day (extra hard) chromic catgut in all sizes from No. 2 to No. 000, of six concerns and twenty day (medium hard) chromic catgut in sizes No. 2, No. 0 and No. 000 of four concerns were used in the study. Most of the catgut tested

was manufactured prior to the change in labeling recommended by the Committee of Revision of the U. S. Pharmacopoeia, which has adopted the following nomenclature for the various types of surgical gut:

- Type A Plain Surgical Gut (untreated)
- Type B Mild Chromic (mild treatment)
- Type C Medium Chromic (medium treatment)
- Type D Extra Chromic (prolonged treatment)

These official designations are the approximate equivalents of plain ten day chromic, twenty day chromic and forty day chromic catgut respectively. The remaining portions of each strand of surgical gut used in the implants were saved for a determination of its original tensile strength by means of a spring scale and for subsequent digestion tests in enzyme solutions. The animals were killed at the end of various periods, depending on the type of catgut which had been implanted and the residual tensile strength of the specimens thus recovered was measured to afford comparison between the different brands studied. These observations were plotted on graphs in terms of the days of the duration of tensile strength of the gut from averages obtained from six or more individual tests on each size, type and brand of gut. In those tests in which there was appreciable residual tensile strength at the implanted gut at the termination of the test implantation period this residual strength was measured. With the data on original tensile strength, the residual tensile strength and the duration of the gut in the tissues a theoretical end point was computed by graph or equation. The theoretical end point was construed as the time at which useful holding power of the suture was gone. The graph or equation method was based on the assumption that the decline in tensile strength of surgical gut (catgut) in the tissues was a relatively constant factor, at least within reasonable limitations. This assumption was supported by observations made during the course of this work, as well as by other investigators. When implant specimens were recovered from the animal in short fragments with obvious loss of continuity, it was considered that the end point of complete loss of tensile strength had been reached. As pointed out in the latter part of this work the loss of tensile strength of the gut was not necessarily shortly followed by complete disappearance of the gut from the tissues, especially when the gut remained intact for ten days or more in the tissues.

To test the reliability of the tests conducted on dogs as an index of the behavior of catgut in human tissues the results obtained in the series of dog implants were graphically compared with clinical tests made in the laparotomy wounds of patients previously reported by the investigators. The series of graphs used to tabulate the various observations which were made in the study appear in the original paper.

The results obtained indicate that plain catgut of most manufacturers usually underwent a complete loss of tensile strength within approximately five days, whereas the various brands of chromic (treated) catgut showed considerable variation in performance. The differences between the duration of the tensile strength of twenty day and forty day chromic catgut of the same brand were relatively slight. The behavior of the twenty and forty day chromic catgut (without regard to size) of the different manufacturers was classified into three general categories: (1) those which did not maintain their tensile strength for ten days; (2) those which lasted ten to fifteen days; and (3) those which held up for fifteen to thirty days. The various sizes for the same type of chromic material were frequently found to perform within different categories. The smaller sizes of chromic gut of several concerns outlasted the larger sizes rather conspicuously, although in other products the larger sizes held up better than the smaller sizes. A uniform loss of tensile strength of large and small sizes was rather uncommon. Attention has been drawn by other investigators to the longer duration of the smaller sizes of chromic gut in the tissues when certain products are used. The plain catgut was inclined to last about one day longer in patients than in dogs whereas the chromic tended to hold a few days less in patients than in the animals.

On the basis of their results the investigators point out that the terms 'twenty day' or 'forty day' which have been used for chromic catgut are to a considerable extent unreliable as far as duration of tensile strength in the tissue is concerned and

1 Jenkins H. P. and Hrdina I. S. Absorption of Surgical Gut (Catgut). I. The Decline in Tensile Strength in the Tissues. Arch. Surg. 44: 881 (May) 1942. II. Pepsin Digestion Tests for the Evaluation of the Duration of Tensile Strength of Surgical Gut in the Tissues. Ibid. June 1942. Jenkins H. P. and Hrdina I. S. Swisher F. M. and Owens I. W. III. The Duration of Surgical Gut in the Tissues After Loss of Tensile Strength. Ibid. July 1942. Jenkins H. P. IV. Recommendations for the Absorbability and Digestibility Specifications of Surgical Gut. Ibid. August 1942.

that the Committee of Revision of the U. S. Pharmacopoeia has taken a justifiable step in the elimination of such terms from the nomenclature of this suture material. From the tests made, the so-called twenty-day chromic material (which is ordinarily used in suturing tissue) could not be expected to maintain its tensile strength for anywhere near that period, and the question was raised as to what should be the duration requirement of such material used in the ordinary case by the average surgeon. The reason for the failure of chromic catgut to maintain its holding power for the designated period, particularly in the larger sizes, is explained by the likelihood that manufacturers from experience had found it necessary to decrease the amount of chromic treatment sufficiently to avoid late absorption, which usually is the cause of a draining sinus from a knotted portion of the unabsorbed suture. Certain differences in plain catgut of the various brands tested are explained by probable differences in the source and method of preparation of the raw product obtained from sheep intestine. It is indicated that this might also account for variations in the chromicized sutures, since most manufacturers employ methods of treatment which are deemed to give a fair amount of precision, although making allowances in the chromic treatment of the larger sizes. The slight difference in the behavior of the material in human beings and in dogs is explained on the basis of the differences in tension of the implanted sutures and in the method of implantation.

The investigators conclude that the implantation technique is a satisfactory direct method of evaluating the absorption qualities of surgical gut (catgut) from the standpoint of the rate of decline of its tensile strength in the tissues, that the nomenclature formerly employed to designate the absorption period of sutured products is sufficiently unrelated to the duration of their tensile strength to warrant its discontinuance, and that a period of about ten to fifteen days is probably better suited to the need of the average surgeon for routine closure of wounds, particularly when large sizes of chromic suture material are used.

#### II. TESTS: DIGESTION TESTS FOR THE EVALUATION OF THE DELAY OF TENSILE STRENGTH OF SURGICAL GUT IN THE TISSUES

This part of the investigation deals with *in vitro* digestion tests of catgut sutures and the relation of the digestion time in pepsin to the duration of the tensile strength in the tissues as reported in part I. It is pointed out that, although trypsin has probably been most generally employed as the enzyme for such tests, pepsin was used to explore the possibilities of this enzyme as a satisfactory basis for evaluating the absorption qualities of surgical gut. In one group of tests, digestion time was measured by a previously described ingenious method devised by Kraissel and Melencz (for trypsin digestion), so that, when strands of suture material held under tension by means of 30 Gm. lead weights were severed as a result of exposure to an acid pepsin solution in a special incubator, the circuit activating an electric clock was broken to permit determination of the elapsed period of exposure. At first the gastric juice obtained from dogs was used for the testing and then, after experimentation to ascertain the concentrations of pepsin and hydrochloric acid that most nearly approximated the results obtained with pure gastric juice, an aqueous solution of pepsin U. S. P. 10% (w/v) and hydrochloric acid U. S. P. 1% (v/v) was used. In another group of tests a simpler method of measuring digestion time was devised by affixing 2 Gm. split lead shots to sutures suspended in a graduated cylinder containing the same solution, so that the shrinkage, subsequent stretching and eventual breaking of the catgut could be detected by changes in the level assumed on the scale by the attached weights. The end point of breakage was conveniently detected by the noise made from the impact of the weight on the bottom of the cylinder or by estimating the time at which this would occur from the amount of stretching last detected. This procedure permitted a large number of observations to be made in an ordinary laboratory incubator. The temperature of incubation in both methods of testing was 37° C. and, in all, over three thousand two hundred tests were made. Essentially the same surgical gut which was used in the tissue implants was used for the digestion experiments. The shrinkage phase of the

catgut in the solution was attributed to the acid, because it occurred in a hydrochloric acid solution of the same concentration without pepsin. Heat sterilized catgut was found to undergo more shrinkage than raw catgut not subjected to heat sterilization. The rate and extent of initial shrinkage were found to bear a relationship to the length of time for digestion. If rapid and considerable shrinkage occurred, the digestion time was shorter than when shrinkage was slow and less extensive. Breakage normally occurred during the period of stretching. If the break occurred before the stretching phase, it was considered a premature break, which was often due to a small area in the gut more vulnerable to digestion than the rest of the strand. Plain catgut and some of the large sizes of chromic catgut, when securely tied to lead weights, were found to undergo spontaneous untying while exposed to the action of the acid pepsin, whereas similarly exposed small sizes of the more resistant chromic catgut usually did not. This observation is of obvious significance to the surgeon who uses surgical gut for gastrointestinal anastomosis where the inner suture is bathed in gastric juice.

The 2 Gm. procedure of testing revealed that plain catgut of all brands tested was digested in an average of eleven hours, the larger sizes showed a general tendency to resist digestion longer than the smaller sizes. On the other hand, the average time for digestion of chromic catgut varied widely with different brands; most of the products tested averaged more than twenty hours, though some were almost the same as that observed generally for the plain material. Differences between the twenty-day and forty-day chromic sutures of the same brand and size were relatively minor. The smaller sizes of chromic gut of several companies outlasted the larger sizes by a conspicuous margin, although in other products the opposite was observed. These observations coincided with the results obtained by implantation of the gut in the tissues.

The 30 Gm. tests showed that plain catgut was digested in twenty-five to fifty hours and chromic catgut in fifty to one hundred and twenty-five hours. The longer digestion time by this method as compared to the 2 Gm. method was attributed to the greater degree of tension produced with the 30 Gm. procedure, a factor in the delay of penetration of the peptic ferment. It was found that results from the 30 Gm. and 2 Gm. tests had an approximate relationship of  $2\frac{1}{2}$  to 1 on the basis that twenty-five hours' exposure by the former was the equivalent of ten hours' exposure by the latter. By either test procedure, raw plain catgut (not heat sterilized) was found to have a rather wide range in digestion time depending on the source of the material, and chromicized catgut (not heat sterilized) was found to have a longer digestion time than that usually observed for the heat sterilized product of the same concern. All the observations from the two procedures were plotted on graphs which will accompany the original paper.

A correlation of the 2 Gm. digestion experiments and the previously accumulated observations on the duration of tensile strength in the tissues was done by using the combined averages from six of the ten brands studied for plain catgut and by using the separate averages obtained from each of the six brands of chromic catgut. These averages (plotted on a graph) showed an essentially straight line relationship, indicating that ten hours in digestion time should be considered the approximate equivalent of five days of duration of tensile strength in the tissues. It was shown that there was a corresponding trend in the general behavior of catgut in pepsin and in the tissues if allowances were made for variations in size and the brand of material studied, so that a reasonably accurate prediction of the tensile strength could be made on the basis of the digestion tests. The discrepancies of appreciable magnitude in the correlation are explained from the standpoint of a number of factors, such as management of the raw product, duration and temperature of sterilization, chemical agents in the tubing fluid and obscure details in the method of chromic treatment employed. Without possession of every detail involved in the preparation of surgical gut, it is indicated that the reliability of digestion tests *in vitro* to ascertain the expected duration of the tensile strength of the material in the tissues would be questionable. The influence of some factors on the results of digestion tests is discussed, particularly the variability of the original raw product.

In the evaluation of the reliability of the digestion test as an assay of the absorption qualities of surgical gut, the investigators point out that the enzyme preparation should be uniform (the one used in their study was obtained from the same source), its rate of deterioration during use must be taken into account (relatively high concentrations appeared to minimize attenuation of the enzyme) and the growth of bacteria in the solution must be prevented (the acid in the acid pepsin solution used gave adequate bacteriostasis). Other sources of error, such as too much tension and variation in the quality of different portions of the same strand of catgut, are also mentioned. The 2 Gm suspension pepsin digestion test is suggested as a means of evaluating raw catgut, with such a method correlation may be established between unsterilized and heat sterilized chromic catgut which might serve as a basis for determination of the absorption qualities of this material before it is tubed, labeled and heat sterilized. Trypsin digestion of catgut which has not been heat sterilized proceeds too slowly to offer a feasible method for testing surgical gut before it reaches the stage of the sterilized finished product. The investigators propose the use of a common source of pepsin for testing the surgical gut marketed by several manufacturers in order to establish a basic unit for the tensile strength of the products in the tissues.

The investigators conclude that within certain limitations the 2 Gm suspension pepsin digestion test described in their paper offers a simple, rapid, indirect method of evaluating the absorption qualities of surgical gut of most manufacturers, that discrepancies in the reliability of digestion tests on some products will probably not be understood fully without more information regarding their manufacture than is now generally available to investigators and that any such method of assaying catgut should be checked at intervals by clinical and experimental tissue implants to avoid misleading interpretations of the absorption quality of surgical gut on the market.

### III THE DURATION OF SURGICAL GUT IN THE TISSUES AFTER LOSS OF TENSILE STRENGTH

The importance of this aspect of the absorption of catgut in relation to the problems of delayed healing and early disruption of surgical wounds is pointed out in connection with references to previously published reports on the subject. The investigators endeavored to obtain a comprehensive view of the ultimate fate of surgical gut after loss of tensile strength from a series of approximately two thousand experimental implants in the abdominal muscles of dogs and from thirty-five clinical specimens obtained from patients at autopsy or secondary operation. Specimens of the animal tissue implants were obtained by killing the dogs after various periods of survival. Both the experimental and the clinical specimens were first examined grossly and then sectioned for microscopic study. Essentially the same products or the ten manufacturers which were studied in parts I and II were employed for this study, the sizes of catgut ranging from No 2 to No 000. Most of the catgut used was of the nonboilable variety, though a considerable number of samples of the boilable type were compared to the former. The gross and microscopic appearance of the specimens of tissue and of the various types, sizes and brands of catgut was recorded by means of photographs which will appear in the original paper.

The results obtained indicate a number of variable aspects in the absorption of surgical gut: the variation between different brands was generally of greater magnitude than that which occurred between the types or sizes of catgut of any one brand or between any particular lot of the same brand. The absorption behavior of the catgut could generally be classified from the gross appearance as "rapidly absorbed" or "slowly absorbed" and occasionally as "intermediately absorbed." Catgut which was previously found to have usually lost its tensile strength in less than ten days was generally "rapidly absorbed" within one to three weeks, that which usually retained its tensile strength beyond ten days was generally "slowly absorbed" within three to six months and that which occasionally remained intact for approximately ten days was frequently "intermediately absorbed" within three weeks to three months. The absorption behavior of catgut sutures could also be correlated, from the standpoint of the microscopic studies, with the cellular response of the tissues.

The response to catgut was characterized by two phases of reaction: an initial reaction consisting of an invasion of the surrounding tissues and the suture material by polymorphonuclear leukocytes (which subsided after fragmentation of the catgut), attributed to the action of liberated leukocytic enzymes, and a secondary reaction consisting of an invasion of the adjacent tissues and the suture material by macrophages or histiocytes which completed the fragmentation and destruction of the catgut by phagocytic activity. The leukocytic reaction was found to be characteristic of the "rapidly absorbed" class of material, whereas the more "slowly absorbed" classes which survived the first phase were gradually attacked by the phagocytic cells. Foreign body giant cells were also detected in the tissues of the latter class of catgut. With certain exceptions, most brands of plain catgut underwent more or less complete absorption, with the leukocytic response predominating; whereas most varieties of the chromic sutures tended to elicit a less intense initial reaction and were associated with a more conspicuous macrophage response. In general, the severity of the initial tissue response could be correlated with the gross appearance of the different types of catgut and the observations on their tensile strength. The phagocytic cells in the tissues, characteristic of the "slowly absorbed" material, often remained for a long time. Sometimes the chromic catgut remained unabsorbed after periods longer than six months. Fibrous tissue encapsulation of chromic catgut which remained intact for ten days or more was also observed grossly and microscopically. The few instances in which this type of suture underwent rapid absorption were attributed to failure or delay in the encapsulation process. The catgut knot was usually the last portion absorbed when this process was rapid, but it was absorbed more like the rest of the suture when the process was slow. The plain catgut, because of its elicitation of a predominant leukocytic reaction, was regarded as more irritating material than chromic catgut, which usually stimulated fibroblast and macrophage activity. The investigators cite previously reported controversial evidence concerning this point and suggest that irritating chemicals used in the chromicizing process (which were not completely removed) or in the tubing fluid employed for boilable catgut could be a source of irritation where substantial irritation was observed in some chromicized gut products, the bulk of the suture material is also indicated as a factor in irritation. The possibility that a certain amount of the tissue reaction was due to sensitization is discounted in the present study.

The investigators recommend that the larger sizes of chromic catgut for fascial closure of the average case should probably have properties described as "intermediately absorbed" (about ten days duration of tensile strength and complete absorption in three weeks to three months), because the minimum length of time required for normal healing should be considered as ten days on the basis of the extensive work by Howes and others. However, since the choice of catgut hinges on the bulk of suture material concentrated at any one point in the wound, they suggest that the smaller sizes of the "slowly absorbed" chromic sutures should be employed to provide greater duration of tensile strength with a minimum of bulk in order to avoid the production of draining sinuses sometimes induced by relatively resistant bulky material. They also recommend that the use of smaller sizes of plain catgut, when "rapidly absorbed" material is desired, would minimize the more acute tissue reaction generally attributed to this type of suture. Attention is drawn to other work in support of the use of the smaller sizes of catgut, especially the numerous communications by Howes and others.

The investigators conclude that the fallacy of designating absorption time as a specific number of days, such as ten day, twenty day or forty day, has been clearly demonstrated, that, although the present classification recognizes four different types, their study suggests that not more than three general categories can be reasonably used to classify the absorbability of catgut, that there does not appear to be any major clinical problem of wound closure which cannot be solved by absorbable suture material, and that more uniform standards for the different types of surgical gut manufactured would be of considerable aid to the surgeon in the selection of absorbable suture material best suited to his needs.

IV. RECOMMENDATIONS FOR THE ABSORBABILITY AND  
DIGESTIBILITY SPECIFICATIONS OF SURGICAL GUT

The fourth part of the study is devoted to the consideration of the specifications, which would appear to be most desirable from the standpoints of the patient and surgeon as well as of the manufacturer for the classification of catgut in accordance with the new terminology adopted by the Committee of Revision of the U. S. Pharmacopeia for designating and labeling this suture material under the name "surgical gut." The investigators point out that the division of the various types of surgical gut into type A for plain untreated surgical gut and into types B, C and D for the three grades of treated (chromicized, tanned or otherwise) surgical gut is not as yet accompanied by official statements as to the degree of resistance to digestion or absorption these types of suture material might be expected to possess. However, they indicate that in the absence of standard specifications manufacturers undoubtedly have been carrying over at least to some extent the specifications formerly used for their plain catgut and for their ten day, twenty day and forty day chromic catgut for products labeled by the new terminology as types A, B, C and D respectively.

On the basis of the experimental and clinical observations over a period of more than five years (as reported in the preceding parts of their study) the investigators propose specifications for the four types of surgical gut which are to be recommended for U. S. P. XII. They indicate that the division of surgical gut into these four types is somewhat arbitrary and subject to some overlapping in view of their studies which suggest only three general categories. The specifications they recommend are predicated on the basis that type A (plain) is presumed to represent 'rapidly absorbed' material, type D (extra chromic) 'slowly absorbed' material, type B (mild chromic) 'rapidly absorbed' or 'intermediately absorbed' material and type C (medium chromic) 'intermediately absorbed' or 'slowly absorbed' material. In setting up specifications for the four types the investigators proposed as a reference standard for grading the use of digestibility data averaged from the results obtained from widely selected specimens of plain untreated heat sterilized surgical gut if such a batch of this material could be found experimentally and clinically to have a duration of tensile strength of approximately five days as reported in their studies. It is emphasized however that digestibility is the secondary consideration, the primary consideration being absorbability and that the former is useful only as a means of accomplishing some degree of uniformity by utilization of some readily applied test in an attempt to meet the specifications for the four types of material.

In the specifications recommended by the investigators, time data for both the absorbability and the digestibility of the four types of surgical gut are proposed. The absorbability data for each type are divided into duration of tensile strength in the tissues (subdivided into an average, a theoretical minimum range and a probable maximum range) and ultimate complete absorption in the tissues (given only as an average range). The digestibility data for each type are subdivided like that for the duration of tensile strength in the tissues. The duration of tensile strength for each of the four types is expressed as average absorbability with the symbols AAA, AAB, AAC and AAD respectively, theoretical minimum range of absorbability with the symbols TRAA, TRAB, TRAC and TRAD, and probable maximum range of absorbability with the symbols PRAA, PRAB, PRAC and PRAD. The digestibility is similarly expressed as average digestibility with the symbols ADA, ADB, ADC and ADD, theoretical minimum range of digestibility with the symbols TRDA, TRDB, TRDC and TRDD, and probable maximum range of digestibility with the symbols PRDA, PRDB, PRDC and PRDD. The absorbability data are given in multiples of the average digestibility of type A surgical gut (ADA) defined as the average digestion time in hours of plain catgut in vitro by an enzyme digestion test and to be determined as indicated above by the establishment of a common standard for this material. The values given for digestibility for the various types are elaborated on the basis of the

correlation established with the decline of tensile strength in the tissues and in acid pepsin from the previous studies.

The values for all the criteria specified for the absorbability and digestibility of surgical gut (to be tabulated in the original paper) are discussed from the practical standpoint of the use of surgical gut as suture material by the surgeon. The investigators emphasize that in the choice of surgical sutures more attention should be paid to the fundamental principle of minimizing local bulk of foreign material in wounds, and that use of the smaller sizes of surgical gut of the "slowly absorbed" type offers a basis for a more reliable closure of abdominal wounds without having to resort to nonabsorbable material or to large sizes of slowly absorbed gut, which may lead to a draining sinus. However, doubt is expressed that surgeons can be persuaded to use absorbable material in place of the nonabsorbable material now commonly employed in gastrointestinal anastomosis unless a reliable, relatively highly resistant surgical gut of type D is made generally available by all the manufacturers. They admit that the vagaries of surgical gut and the available methods for assaying its digestibility and absorbability make it obvious that the ranges of values set up in the proposed specifications would be subject to practical variation and that this should be taken into consideration in whatever specifications are ultimately elaborated.

The paper is concluded with the following brief general outline of the specifications recommended for surgical gut.

| Type of Surgical Gut | Absorbability in the Tissues<br>Duration of Tensile Strength | Complete Absorption | Digestibility in Enzymes |
|----------------------|--|---------------------|--------------------------|
| Type A               | 5 days   | 1 to 3 weeks        | ADA                      |
| Type B               | 5 to 10 days   | 3 wks to 3 mos      | 1 to 2 × ADA             |
| Type C               | 10 to 15 days  | 3 to 6 months       | 2 to 3 × ADA             |
| Type D               | 15 to 25 days  | 6 months            | 3 to 5 × ADA             |

[EDITOR'S NOTE—The senior author of the paper reviewed in the foregoing synopsis has indicated that further correlative studies on the absorption of surgical gut with trypsin digestion tests and on the nature of tubing fluids are in progress and will be made the subject of subsequent reports to be submitted for later publication as additional parts of the present series appearing in the *Archives of Surgery*.]

## NEW AND NONOFFICIAL REMEDIES

THE FOLLOWING ADDITIONAL ARTICLES HAVE BEEN ACCEPTED AS CONFORMING TO THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY OF THE AMERICAN MEDICAL ASSOCIATION FOR ADMISSION TO NEW AND NONOFFICIAL REMEDIES. A COPY OF THE RULES ON WHICH THE COUNCIL BASES ITS ACTION WILL BE SENT ON APPLICATION.

AUSTIN E. SMITH, M.D. Acting Secretary

**CALCIUM GLUCONATE** (See New and Nonofficial Remedies, 1941, p. 176)

The following dosage forms have been accepted

PARKE, DAVIS & COMPANY, DETROIT

Compressed Tablets Calcium Gluconate 0.5 Gm (7½ grains) and 1 Gm (15½ grains)

**SODIUM r-LACTATE ONE-SIXTH MOLAR** (See the Revised Supplement to New and Nonofficial Remedies, 1941, p. 27)

The following product has been accepted

ABBOTT LABORATORIES, NORTH CHICAGO, ILL.

Solution Sodium-r-Lactate ½ Molar 500 cc and 1,000 cc bottles. A sterile solution of sodium r-Lactate one-sixth molar (18.7% W/V) in distilled water.

**SULFAPYRIDINE** (See New and Nonofficial Remedies, 1941, p. 511)

The following dosage form has been accepted

GEORGE A. BREON & CO., INC., KANSAS CITY, MO.

Tablets Sulfapyridine 0.5 Gm (7.7 grains)

**AMYLCAINE HYDROCHLORIDE** (See the Revised Supplement to New and Nonofficial Remedies, 1941, p. 12)

The following additional dosage form has been accepted

NOVOCOL CHEMICAL MFG. CO., INC., BROOKLYN

Solution Amylcaine Hydrochloride 4% 1 ounce and 2 ounce bottles

## THE ACCELERATED PROGRAM OF MEDICAL SCHOOLS

As a war measure programs have been initiated to increase the supply of physicians for the Army, Navy and civilian population by the adoption of an accelerated program of medical education by the various medical schools of the country. In connection with the adoption of such programs, the Council on Medical Education and Hospitals of the American Medical Association, the Association of American Medical Colleges and the Federation of State Medical Boards of the United States in February 1942 adopted resolutions as follows:

*Council on Medical Education and Hospitals of the American Medical Association*—The Council is of the opinion that the adoption of a program for an accelerated curriculum for approved medical schools during this war period is a decision which should be determined by each medical school.

The decision of a medical school to initiate an accelerated curriculum should be made only after a comprehensive survey of the personnel, facilities and equipment of the school and its ability to give a medical education without deterioration of the quality of the medical instruction and in conformity with the statutes of the various states and the rulings of the state medical boards.

The Council stands ready to make necessary inspections whenever in its judgment such inspections are required to maintain the present high standards of medical education.

The Council believes that financial assistance for needy medical students during the accelerated program is best provided through scholarships or loans.

*Association of American Medical Colleges*—The executive Council requested approval of the recommendations sent to the deans of member colleges Dec 18 and Dec 23 1941 urging member colleges, which can do so without any lowering of present standards of medical education, to go on an accelerated program of instruction on or about July 1 1942.

Attention is called to the fact that the Executive Council recommended that only those medical colleges that can do so without lowering present standards of medical education should adopt the accelerated program. This applies not only to the utilization of the summer as a teaching period but also to the interval at which freshman classes are admitted; that is, whether annually or at approximate nine month intervals.

The Executive Council recommends that the accelerated program consist of four full academic sessions of not less than thirty-two weeks each and that graduation shall not follow sooner than thirty-five months after first matriculation as a freshman.

The Executive Council recommends that as many colleges as can do so start instruction of the next freshman class on or about July 1 1942 and subsequent freshman classes at approximately nine months intervals until July 1, 1945.

The Executive Council recommends that in admitting students for the accelerated program, eligibility requirements for admission be not lowered from the present minimum standards set by the Association of American Medical Colleges.

The Association of American Medical Colleges requests that the Federation of State Medical Boards recommend to its members that they arrange to make whatever changes are necessary in state licensing laws and/or board regulations to legalize licensure of students graduating under the accelerated program adopted by medical schools to meet the needs of the national emergency.

*Federation of State Medical Boards of the United States*—WHEREAS As a war emergency measure several approved medical schools of the United States are contemplating to accelerate the courses of medical education so as to comprise four full academic sessions of at least thirty-two weeks each and that at least thirty-six months shall elapse between the beginning of medical instruction and graduation, and

WHEREAS, The medical schools initiating such an accelerated curriculum will be able to maintain the personnel, facilities and equipment necessary to give a medical education without deterioration of the quality of the medical instruction and in conformity with the statutes and licensure regulations of their respective states and territories of the United States and the District of Columbia, and

WHEREAS, The proposed accelerated course of medical education as a war emergency measure is expected not to extend beyond the present period of war emergency, therefore be it

*Resolved*, That the Federation of State Medical Boards of the United States in annual session assembled in Chicago Feb 17 1942 hereby endorse the proposed accelerated course of medical education and recommend it in principle as a war emergency measure for favorable consideration by the licensing authorities of the several states and territories of the United States and the District of Columbia.

In adopting these resolutions all three agencies emphasized the importance of the maintenance of high standards of medical education in connection with any program adopted.

There are many problems involved in connection with the proposed changes in the program of medical education. With the curriculum extending throughout the

calendar year with only a brief vacation between sessions, students will have little or no opportunity to seek employment for the purpose of financing their medical education. There is, however, some promise that loan funds and scholarship funds may be made available through the deans of the various medical schools to assist in the financing of needy students. Through the Association of American Medical Colleges, application

United States and Canada, funds to be used for either loans or scholarships.

Another difficulty involved will be that of correlating or integrating the graduation of medical students every nine months with the customary one year rotating internships.

In order to present a clear picture of the programs of the various medical schools, questionnaires were sent

\* Internship required for M.D. degree  
(n) Commencement June 1943  
(h) Quarterly graduation  
(c) Second year—September  
(d) Students may take laboratory and clinical courses in summer quarters. M.D. awarded special students in September  
(e) Senior year accelerated 1941-1942—M.D. conferred March 1942  
(f) No seniors 1941-1942  
(i) Seniors—June

(h) Senior year accelerated 1941-1942—M.D. conferred May 2, 1941  
(i) Seniors—July  
(j) Undecided  
(k) Operated on four quarter plan—new students admitted in classes graduated every quarter  
(l) Classes in session since March 23, 1942  
(m) Entire curriculum accelerated session 1941-1942  
(n) Senior year accelerated 1941-1942—M.D. conferred March 29, 1941

has been made for federal funds for this purpose. The W. K. Kellogg Foundation is initiating a plan involving the availability of funds to meet the immediate emergency offering to one hundred and fifty schools of medicine, dentistry, public health and nursing in the

by the Council and in table 1 are listed these schools with as accurate information as has been obtainable with regard to the details of their program. In table 2 are listed the schools of the basic medical sciences with similar data regarding their programs.

The following schools have adopted the accelerated curriculum involving both the acceptance of entering students and the graduation of a class every nine months

University of California Medical School  
University of Colorado School of Medicine  
Yale University School of Medicine  
Georgetown University School of Medicine  
George Washington University School of Medicine  
Emory University School of Medicine  
University of Georgia School of Medicine  
Loyola University School of Medicine  
Northwestern University Medical School  
University of Chicago The School of Medicine  
University of Illinois College of Medicine  
Indiana University School of Medicine  
State University of Iowa College of Medicine  
University of Louisville School of Medicine  
Louisiana State University School of Medicine  
Johns Hopkins University School of Medicine  
University of Maryland School of Medicine and College of Physicians and Surgeons  
Boston University School of Medicine  
Harvard Medical School  
Tufts College Medical School  
Wayne University College of Medicine  
University of Minnesota Medical School  
St. Louis University School of Medicine  
Washington University School of Medicine  
Creighton University School of Medicine  
University of Nebraska College of Medicine  
Long Island College of Medicine  
Columbia University College of Physicians and Surgeons  
Cornell University Medical College  
New York Medical College, Flower and Fifth Avenue Hospitals  
New York University College of Medicine  
University of Rochester School of Medicine  
Duke University School of Medicine  
Bowman Gray School of Medicine of Wake Forest College  
Western Reserve University School of Medicine  
Ohio State University College of Medicine  
University of Cincinnati College of Medicine  
University of Oregon Medical School  
Hahnemann Medical College and Hospital of Philadelphia  
Jefferson Medical College of Philadelphia  
Temple University School of Medicine  
University of Pennsylvania School of Medicine  
University of Pittsburgh School of Medicine  
Medical College of the State of South Carolina  
Vanderbilt University School of Medicine  
University of Vermont College of Medicine  
University of Virginia Department of Medicine  
Medical College of Virginia  
Marquette University School of Medicine

Eleven schools have adopted an accelerated curriculum involving the graduation of a class every nine months but will admit an entering class on an annual basis as follows

College of Medical Evangelists  
University of Southern California School of Medicine  
Stanford University School of Medicine  
Tulane University of Louisiana School of Medicine  
University of Michigan Medical School  
Albany Medical College  
University of Buffalo School of Medicine  
Syracuse University College of Medicine  
Woman's Medical College of Pennsylvania  
University of Texas Medical Branch  
University of Wisconsin Medical School

The University of Tennessee College of Medicine will operate as in the past on the four quarter plan,

admitting new students and graduating a class every quarter

Eight schools have not adopted an accelerated program namely

University of Arkansas School of Medicine  
Howard University College of Medicine  
University of Kansas School of Medicine  
University of North Dakota School of Medicine  
University of Oklahoma School of Medicine  
University of South Dakota School of Medical Sciences  
McHerry Medical College  
Baylor University College of Medicine

As has been pointed out, there are many difficulties involved in the acceleration of the program, and where a school has failed to adopt such a program in order to maintain satisfactory standards it is to be commended rather than criticized

The acceleration of the training of medical students to the end that graduation will occur following three calendar years of instruction raises questions concerning medical licensure that demand consideration along with a consideration of the merits of the proposal itself

The medical practice acts of the several states define the standards that a medical school must maintain in

TABLE 2—Program of Schools of the Basic Medical Sciences, 1942-1943

| School  | Session Begins |                   |  |

| University of Missouri School of Medicine             | June           | June              | March                                  |
| Dartmouth Medical School                              | May            | May               | February                               |
| University of North Carolina School of Medicine       | June           | June              | March                                  |
| University of North Dakota School of Medicine         | September      | September         | September                              |
| University of South Dakota School of Medical Sciences | September      | September         | September                              |
| University of Utah School of Medicine                 | June           | June              | March                                  |
| West Virginia University School of Medicine           | June           | June              | March                                  |

order that graduates may qualify for licensure. If those standards are defined in such a way that courses of study must be given in four different calendar years, the obvious result will be that graduates after the abbreviated course will be disqualified for licensure unless the standards are reset by amendatory legislation

The situation in the several states in this respect may be briefly summarized as follows: the summary being based on the provisions of the several medical practice acts

In the following seven states there are statutory provisions that would seem to require modification before licenses can be granted to persons who have graduated after three calendar years of instruction

|          |          |            |
|----------|----------|------------|
| Georgia  | Maryland | Nebraska   |
| Illinois | Michigan | New Jersey |
| Kansas   |          |            |

In the following five states statutory provisions obtain that may necessitate rather liberal construction to permit the granting of such licenses

|               |                |           |
|---------------|----------------|-----------|
| Kentucky      | Mississippi    | Tennessee |
| Massachusetts | North Carolina |           |

In twenty-eight states and in the District of Columbia the statutory provisions seem to be broad enough to permit the granting of licenses to such graduates if the

examining boards or other state approving agencies will recognize a medical school that graduates students after the abbreviated course of study. In these states, if standards have been set up by examining boards or other approving state agencies by rule or regulation and if existing standards preclude the licensure of graduates after abbreviated courses, the rules or regulations must be amended to permit such licensure.

|                      |               |                |
|----------------------|---------------|----------------|
| Alabama              | Louisiana     | Rhode Island   |
| California           | Maine         | South Carolina |
| Colorado             | Minnesota     | South Dakota   |
| Connecticut          | Missouri      | Texas          |
| Delaware             | Montana       | Utah           |
| District of Columbia | New Hampshire | Vermont        |
| Florida              | New York      | Virginia       |
| Idaho                | North Dakota  | Wisconsin      |
| Illinois             | Ohio          | Wyoming        |
| Iowa                 | Pennsylvania  |                |

In the remaining eight states, graduates after the abbreviated course may obtain licensure if the school of graduation is one approved by the Association of American Medical Colleges or, in the case of two states, Arkansas and Oregon, and possibly a third, West Virginia, by the Council on Medical Education and Hospitals of the American Medical Association.

|          |            |               |
|----------|------------|---------------|
| Arizona  | New Mexico | Washington    |
| Arkansas | Oklahoma   | West Virginia |
| Nevada   | Oregon     |               |

Within the next few months an attempt will be made to develop a fairly accurate approximation of the number of trained personnel to be secured by this process of speeding the production of physicians and to ascertain whether the number of physicians so trained will be adequate to supply the anticipated needs of the military and civilian population for new graduates during the next few years.

STATE BOARDS OF MEDICAL EXAMINERS

The fortieth annual compilation of medical licensure and allied statistics by the Council on Medical Education and Hospitals is here presented. The report for the year 1941 includes data regarding (a) medical examining and licensing boards of the United States, the District of Columbia, the territories and the possessions

of the United States, (b) examining boards in the medical specialties, (c) boards of examiners in the basic sciences and (d) the National Board of Medical Examiners.

The official reports which form the basis for these compilations have been contributed throughout the year by the medical licensing boards of all states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands, the homeopathic medical examining boards of Connecticut, Delaware and Maryland, the seventeen boards of examiners in the basic sciences in operation last year (Arizona, Arkansas, Colorado, Connecticut, the District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, New Mexico, Oklahoma, Oregon, Rhode Island, South Dakota, Washington and Wisconsin), the fifteen approved examining boards in the medical specialties, namely, anesthesiology, dermatology and syphilology, internal medicine, neurology, surgery, obstetrics and gynecology, ophthalmology, orthopedic surgery, otolaryngology, pathology, pediatrics, plastic surgery, psychiatry and neurology, radiology, surgery and urology, and the National Board of Medical Examiners. The homeopathic and eclectic examining boards in Arkansas and the homeopathic board in Louisiana did not license any one during the year. Likewise no physicians were registered for civilian practice in the Canal Zone.

The cooperation of the officers of these agencies in furnishing complete reports makes possible these annual compilations. The Council and THE JOURNAL express thanks and appreciation to those who have supplied data, for without such help the presentation of the calculations included in the following pages would not have been possible.

Dates of coming examinations of state licensing basic science boards, specialty boards and the National Board of Medical Examiners appear weekly in THE JOURNAL in the department "Medical Examinations, Licensure." The results of such tests are furnished the office of the Council and are recorded on the biographic record of the physician concerned are published weekly in THE JOURNAL and then are permanently preserved in the archives of the American Medical Association. For a period of twelve years beginning in 1926, the number of physicians coming from abroad have been reported in the official correspondence with the medical

sicians examined on the basis of certificates obtained in countries other than the United States and Canada during 1941.

More than half of the examining and certifying boards obtain from the Council verification of biographic data and other claims before granting a license or permission to take the licensing examination. This service is available to all boards.

The tables referring to medical licensing boards include figures regarding the number of candidates examined in 1941, the number licensed and the number added to the profession. The state boards are discussed first, followed by the specialty examining boards, the basic science boards and the National Board of Medical Examiners.

#### LICENSES ISSUED

The figures presented in the first table cover the number of licenses issued in the various states, territories and possessions, both by examination and reciprocity or endorsement of state licenses or by the certificate of the National Board of Medical Examiners. During the year 1941 there were 8,758 licenses issued to practice medicine and surgery in the forty-eight states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands. Of the 8,758 licenses, 6,020 were issued after examination and 2,738 by reciprocity and endorsement.

Twenty states, the District of Columbia, Alaska, Hawaii and Puerto Rico require that applicants for licensure possess a hospital internship (table 22). However, the licensing boards permit the candidate to take the examination and, if successful, the license is withheld until completion of the internship. The 8,758 licenses issued include, therefore, many candidates who were examined in 1940 and even a few in previous years. Licenses are also withheld for proof of citizenship and minor technicalities. In some states also the licenses of those examined in December are dated and issued only in the following year. The figures in this table therefore will not correspond with those hereafter given.

The greatest number of licenses during 1941 were issued in New York, 1,173; California granted 630; Illinois 581 and Pennsylvania 539. These were the only states which registered more than 500. Twenty states and the territories and possessions issued licenses to fewer than 100. The fewest number (15) were issued in South Dakota. Nevada licensed 16 and

Delaware 22. An interesting point to observe is the fact that in some states the number registered without examination far exceed those required to write an examination, while on the other hand in many states the reverse was the case. The latter is particularly significant in New York where 886 took examinations and 287 received licenses by endorsement of their credentials. Louisiana issued only 12 of its 157 licenses on the basis of credentials only. Three were registered in the Virgin Islands, 11 in Alaska, 14 in Puerto Rico and 31 in Hawaii. Of these 21 were granted certificates by endorsement of credentials, 5 in Alaska, 13 in Hawaii and 3 in the Virgin Islands. The states of Florida and Idaho grant licenses only on the basis of examination. Massachusetts, Rhode Island and Hawaii have no reciprocity agreements but endorse diplomates of the National Board of Medical Examiners.

Figures for six previous years and 1941 giving totals for each year for the number of licenses issued on the basis of examination and endorsement of credentials are contained in table 2. Since 1937 fewer licenses have been issued annually. In 1941 there were 395 fewer licenses issued than in 1940 and 1,075 less than in 1937. The increase in that year of over 800 greater than in 1936 represented largely physicians migrating to this country from Europe.

Licenses issued do not, however, represent individuals, since several have been licensed in more than one state during the year. Nor does the total represent additions to the medical profession at large, since those licensed by reciprocity and endorsement with the exception of the National Board of Medical Examiners, have previously been registered. Table 15 shows how many of those licensed were not previously granted licenses to practice medicine and therefore represent the number added to the medical profession in the United States and its territories and possessions.

In seven years, 63,495 medical licenses have been issued, 43,895 by examination and 19,600 by endorsement of credentials.

#### CANDIDATES EXAMINED BY MEDICAL EXAMINING BOARDS

Compilations referring to those examined for medical licensure by individual states throughout the year indicating the number who passed and failed in each state and the medical school of graduation, are recorded in table 4. There were 7,511 examined, of whom 6,030

TABLE 3—Source of Candidates Examined, 1941

| Medical Schools           | Number | Number Examined | Number Passed | Number Failed | Percentage Failed |
|---------------------------|--------|-----------------|---------------|---------------|-------------------|
| Approved in United States | 67     | 5,206           | 4,966         | 240           | 4.6               |
| Approved in Canada        | 9      | 167             | 142           | 25            | 15.0              |
| Extinct                   | 8      | 8               | 4             | 4             | 50.0              |

| Totals               | 167      | 142    | 25     |

graduated from medical schools extinct, of whom 50 per cent failed, and 422 from unapproved and osteopathic schools, of whom 46 per cent failed.

The 422 from unapproved and osteopathic schools represented 139 graduates of schools of osteopathy, of whom 85 passed and 54, or 38.8 per cent, failed and 283 graduates of unapproved schools of whom 143 passed and 140, 49.5 per cent, failed. Graduates of osteopathic schools were examined by the medical boards of nine states, namely Colorado, Connecticut, Indiana, Massachusetts, New Jersey, Oregon, Texas, Virginia and Wisconsin, while graduates of unapproved medical schools were examined in four states and Hawaii. These states included California, Illinois, Massachusetts and Missouri.

Of the 139 osteopaths, 63 were examined in Massachusetts, 36 in New Jersey, 21 in Texas and 6 in Colorado. Other states examined fewer than 4.

Of the graduates of unapproved schools, Massachusetts examined 229 and Illinois 50. One candidate also was examined by the licensing boards in California, Missouri and Hawaii.

Osteopaths in Colorado, Massachusetts, New Jersey and Texas were examined in medicine and surgery, those in Oregon, Virginia and Wisconsin only in surgery, while Connecticut examined 1 each in medicine, surgery, and medicine and surgery.

The total number examined (7,511) do not represent individuals, since a candidate might take the examination in more than one state and would be counted in each state. This applies to those who pass or fail or those who fail and later pass in one or more states or pass in one or more states and later in the same state fail elsewhere. However, if a candidate fails more than once in a given state within the year he is counted that state only once as a failure.

schools, 150 per cent of whom failed, 1,708 graduates of schools outside the United States and Canada, principally in Europe, with 59.6 per cent failures, 8 who

### EXAMINING BOARDS, 1941—Continued

[illegible]

Three of the five homeopathic boards in existence, Connecticut, Delaware and Maryland, examined 13 candidates, all of whom passed. The homeopathic boards in Arkansas and Louisiana did not examine any one in 1941. The one eclectic board in existence, in Arkansas, did not examine a candidate.

The greatest number of graduates of any one school examined was 174, representing the University of Illinois College of Medicine, who were examined in seventeen states. Of these, 5, 2.9 per cent, failed. The next greatest number, 165, were from the Hahnemann Medical College and Hospital of Philadelphia, examined in eighteen states. Thirty graduates of this school failed to pass the licensure examination, a percentage of 18.2. Only 1 of the 155 graduates of the University of Pennsylvania School of Medicine, who took the test in twenty-four states, failed.

Twenty medical schools in the United States had no failures before medical licensing boards, twenty-four less than 5 per cent, thirteen between 5 and 10 per cent and ten more than 10 per cent. The number examined from many of the schools having a high percentage of failures is small compared to the number of graduates annually from these schools. This is accounted for by the fact that the majority of their graduates take the examinations of the National Board of Medical Examiners. Table 10 includes figures and percentages of all examined during 1941, i.e. those who were examined by the National Board of Medical Examiners in their final examination as well as those passing state tests.

Graduates of Rush Medical College were examined in the greatest number of states, thirty-one, graduates of Northwestern University Medical School by twenty-eight states, Jefferson Medical College twenty-five, the University of Pennsylvania School of Medicine twenty-

four and Loyola University School of Medicine twenty-one. All other schools had their graduates examined in fewer than twenty-one states. Graduates of Stanford, the University of California, Southern California, Georgia Albany Medical College and Pittsburgh were examined in fewer than five states. The Albany Medical College had but 2 of its graduates examined for licensure in 1941, 1 each in Massachusetts and New York both of whom were successful.

The source of candidates for licensure last year are further tabulated in table 3, giving totals for five groups, namely approved medical schools in the United States and in Canada, schools no longer in existence, schools of foreign countries and unapproved institutions. Of the United States schools 4.6 per cent failed and of the graduates of Canadian schools 15.0 per cent. The greatest percentage of failures represented two groups, foreign schools and unapproved schools. In these two groups 59.6 and 46.0 per cent, respectively, failed. Half of the 8 graduates of schools now extinct failed.

One hundred and sixty-seven graduates of nine approved medical schools in Canada took the test for medical licensure in the United States in 1941 in thirty states, the District of Columbia and Hawaii, of whom 142 passed and 25 failed. The greatest number (60) represented McGill University Faculty of Medicine, who were examined in twenty-two states and 45 graduates of the University of Toronto Faculty of Medicine in seventeen states, while 17 from Dalhousie University Faculty of Medicine applied for licensure in three states. The highest percentage of failures was 80, representing 5 graduates from the University of Montreal Faculty of Medicine examined in four states, only 1 of whom was successful. The state of New York examined 42 Canadian graduates, California 23, Minnesota 12 and Pennsylvania 11. All other states testing Canadian graduates

- Passed - Failed

(CONTINUED FROM PAGE 149)

examined less than 10 and nineteen states and Hawaii fewer than 5. Seventeen of the total number of failures (25) were unsuccessful in the examination of the New York Board of Medical Examiners.

Twenty states examined 1,708 graduates of medical schools other than those in the United States and Canada. One took the test in Alaska and 4 in Puerto Rico. In 1941 also 422 unapproved graduates were examined in four states and Hawaii.

Forty-three candidates were examined in Alaska, Hawaii and Puerto Rico, 37 of whom passed and 6 failed. Of these 19 were tested in Hawaii with 1 failure, 18 in Puerto Rico with 5 failures, and 6 were examined in Alaska and passed.

Altogether in 1941 there were 7,511 examined, of whom 6,030 passed and 1,481, or 19.7 per cent failed.

The number so examined in 1941 was a decrease of 410 from the number examined in 1940, likewise a decrease of 252 among successful returns and a decrease of 158 among those who failed. The number of graduates of foreign medical schools examined in 1941 was considerably fewer than the previous years. It may be assumed also that a small number of recent graduates entered the military services of the country before securing state licensure.

Elsewhere are given figures referring to actual licentiates and additions to the medical profession.

#### GRADUATES OF 1939, 1940 AND 1941 EXAMINED FOR MEDICAL LICENSURE

Figures recording graduates of 1939, 1940 and 1941 examined for medical licensure in 1941 are presented in table 6. Altogether, 5,309 were examined, of whom 4,916 passed and 393, or 7.4 per cent, failed. Represented were 4,740 graduates of sixty-seven medical schools of the United States. From the nine approved medical schools in Canada which offer the complete

course, 104 were examined. There were 190 recent graduates of medical schools of countries other than the United States and Canada and 275 graduates of unapproved schools.

Combined totals for the graduates of the three years for each of these groups, recording the number examined, passed and failed, are given in table 7.

Of the medical schools in the United States 3.9 per cent failed while among the graduates of Canadian schools 14.4 per cent, those holding foreign diplomas 46.8 per cent and unapproved schools 37.5 per cent.

Twenty-six schools in the United States had no failures among recent graduates applying for licensure, twenty-four had less than 5 per cent and seventeen more than 5 and ranging to 29.3 per cent, five schools having failure percentages of 20 or more.

TABLE 7—Source of Graduates of 1939, 1940 and 1941 Examined, 1941

| Medical Schools            | Examined | Passed | Failed | Percent Failed |
|----------------------------|----------|--------|--------|----------------|
| Approved, in United States | 4,740    | 4,554  | 186    | 3.9            |
| Approved, in Canada        | 104      | 89     | 15     | 14.4           |
| Foreign                    | 190      | 101    | 89     | 46.8           |
| Unapproved                 | 275      | 172    | 103    | 37.5           |
| Total                      | 5,309    | 4,916  | 393    | 7.4            |

New York examined the greatest number of recent graduates, 697, then came Pennsylvania with 416, Illinois with 389, California with 358 and Ohio with 246. More than 100 from each of seventeen schools were examined, the highest being 164 graduates of the University of Illinois College of Medicine, who appeared before licensing boards in fifteen states. Forty graduates of McGill University Faculty of Medicine, the greatest number from any one Canadian medical school, were tested in seventeen states, while only 1 graduate from the University of Alberta Faculty of Medicine

appeared for registration. Only 11 of the graduates of Yale University School of Medicine of 1939, 1940 and 1941 were examined last year in nine states. Very few also of the recent graduates of Boston University

TABLE 8—Source of Graduates of 1939, 1940 and 1941, Respectively Examined for Medical Licensure 1941

| Medical Schools           | 1939   |        | 1940   |        | 1941   |        |
|---------------------------|--------|--------|--------|--------|--------|--------|
|                           | Passed | Failed | Passed | Failed | Passed | Failed |
| Approved in United States | 431    | 29     | 1 062  | 64     | 3 061  | 93     |
| Approved in Canada        | 23     | 4      | 52     | 7      | 14     | 4      |
| Foreign                   | 47     | 49     | 40     | 38     | 9      | 2      |
| Unapproved                | 28     | 21     | 40     | 47     | 99     | 35     |
| Totals                    | 529    | 103    | 1 204  | 156    | 3 183  | 134    |

School of Medicine, Tufts College Medical School, the New York Medical College, Flower and Fifth Avenue Hospitals and Duke University School of Medicine applied for licensure by this method and only 1 from Albany Medical College. The majority of the graduates of these schools with few examinees before state licensing boards obtained the certificate of the National Board of Medical Examiners and receive state licenses to practice medicine by endorsement of this certificate.

The data enumerated in table 6 are subdivided by years in table 8, giving totals, passed and failed for the graduates of 1939, 1940 and 1941 respectively of (a) approved medical schools in the United States (b) approved medical schools in Canada, (c) foreign faculties of medicine and (d) unapproved schools and schools of osteopathy. Of the graduates of 1939, 529 passed. In 1940 1,204 and 1941 3,183 were successful. The failures of graduates of these three years were respectively 103, 156 and 134.

Table 9 gives the totals of all groups, segregated by year of graduation, examined and the results for each year.

Of the total number of examinees for licensure in the United States in 1941, 707 per cent were graduates of 1939, 1940 and 1941. Of those graduates prior to 1939 49.4 per cent failed, whereas only 7.4 per cent of the recent graduates of all schools failed.

#### CONSOLIDATED EXAMINATIONS

In table 10 are presented for each approved medical school in the United States and Canada the number of graduates examined in 1941 for medical licensure and the number who appeared for part III, the final examination of the National Board of Medical Examiners, in 1941. In some instances schools having a high percentage of failures before licensing boards had few, if any, failures before the National Board.

During the year 5,206 graduates of approved medical schools in the United States were examined by medical licensing boards, of whom 46 per cent failed, while in the consolidated figures 6,042 were examined and 43 per cent failed.

Of the Canadian schools, 150 per cent failed state board tests and 14.8 per cent the combined tests. Only

TABLE 9—Graduates of 1939, 1940, 1941, Respectively Examined 1941

| Graduates of | Examined | Passed | Failed | Percentage Failed |
|--------------|----------|--------|--------|-------------------|
| 1939         | 632      | 529    | 103    | 16.3              |
| 1940         | 1 360    | 1 204  | 156    | 11.5              |
| 1941         | 3 317    | 3 183  | 134    | 4.0               |
| Totals       | 5 309    | 4 916  | 393    | 7.4               |

58 graduates of foreign faculties of medicine took the final test of the National Board of Medical Examiners, while 1,708 were examined by state licensing boards. The National Board does not admit to its examination graduates of other than approved medical schools.

The total of all examined before medical licensing boards was 7,511, of whom 6,030 passed and 1,481, or 197 per cent, failed. For both groups 8,421 were examined, 6,915 passed and 1,506, or 179 per cent, failed. The total percentage of failures has been slightly reduced by including figures for the National Board but materially so for certain schools. Twenty-one schools had no failures in either group.

TABLE 11—Licensure Failures by Graduates of Schools Located  
in the State Where Examined and Elsewhere, 1941

FAILURES BEFORE MEDICAL EXAMINING BOARDS  
BY LICENTIATES

The number licensed after failing a state licensing examination once and after two or more failures, the two groups being classified by indication whether the failure or failures have been in the state in which they are receiving a license or elsewhere and also if the failure has been in the state where licensed and elsewhere, are presented in table 12. These two divisions are given for three groups of candidates, namely graduates of approved medical schools, foreign faculties of medicine and unapproved institutions. The total number of candidates examined and licensed or granted licenses by endorsement or reciprocity in each state is also shown.

P=Passed, F=Failed

Of the 8756 licentiates in 1941, 686 had previously been unsuccessful before a licensing board. Of the approved schools 130 were licensed after one failure in the state where licensed, and 43 licensed after one failure elsewhere. Fifty-four received licenses after more than one failure, of whom 37 received licenses in the state of their previous failures, 16 received licenses after more than 1 failure in other states. One candidate was licensed in Hawaii after failing in Hawaii and before three state boards.

majority of these physicians were Massachusetts and New York examinees. There was 1 graduate of an approved school in the United States who made fourteen attempts in New York before registration.

Seventeen states licensed in 1941 only physicians who never failed a state board examination, while New York licensed 417 who had failed previously. With the exception of California, Illinois, Massachusetts, New Jersey, Ohio and Pennsylvania, no state licensed more than 8 such candidates.

TABLE 12—Failures Before Medical Licensing Boards by Licentiates 1941

|                           | Licenses Issued by Examination, Reciprocity or Indorsement | Approved Schools               |               |                                     |               |  |                                | Foreign Schools |                                     |               |                                | Unapproved Schools |                                     |   |    |     |     | Total Failures by Licentiates, 1911 |

Four hundred graduates of foreign faculties were licensed after previous failure and 59 graduates of unapproved institutions.

In the computation of these statistics it was noted that 57 licentiates had failed five or more times. Of these 22 had five failures before obtaining a license, 10 had six, 9 failed seven examinations, 3 individuals failed eight and nine times, 2 failed ten, 2 failed eleven and 2 failed fourteen tests. Noteworthy were 4 candidates from unapproved medical schools licensed in Massachusetts, 1 each after sixteen, seventeen, twenty-three and twenty-five unsuccessful attempts. The great

In another table presented in this group (table 11) are recorded data referring to the number who failed state board examinations and were graduates of a medical school located in the state in which they were examined and by comparison the number of graduates licensed in the state who obtained their medical training in schools in other states. It is particularly significant that in New York State 218 per cent of those who studied medicine in the nine schools in that state and who appeared for licensure in 1941 failed, while a much higher percentage, 394, who obtained their medical training in forty-three schools located in other

[illegible]

(CONTINUED FROM PAGE 157)

sented licenses from other states, the District of Columbia, Canada and foreign countries, the certificate of the National Board of Medical Examiners, one of the government services or other credentials.

The greatest number of licenses by this method were issued in New York where 287 were registered. Seven other states endorsed more than 100 such candidates: California 229, Michigan 188, Ohio 116, Texas 112, Illinois and New Jersey 107 and Massachusetts 100. The largest group representing the same type of credentials were the 714 diplomates of the National Board of Medical Examiners. Two hundred and fourteen were registered on the basis of such credentials in New York and 100 in Massachusetts.

More than 100 physicians holding licenses from Illinois, Missouri, New York, Ohio, Pennsylvania and Tennessee respectively were licensed in other states.

One license was granted in New York by endorsement of a license issued in Germany. Two were registered in this state without examination on the basis of a diploma from a European medical school. Eight presented licenses issued in Canada as follows: 1 each in New York and Wyoming and 2 in Oregon presented a license issued by the dominion of Canada while a physician was certified in Kentucky on a Newfoundland provincial license, another in Tennessee who presented a New Brunswick credential, and in New York 2 were registered on provincial licenses, namely Ontario and Quebec. California accepted for registration without examination a physician holding a Hawaiian license. Three were admitted to private practice in the Virgin Islands.

Twelve retired officers of one of the government services secured licenses without written examination in six states: 6 in California, 2 in Texas, and 1 each in Kentucky, New Hampshire, North Carolina and Virginia.

Not included in the table are 9 osteopaths licensed by the board of examiners in five states, namely 2 each in the District of Columbia and Oregon and 1 in Virginia granted the right to practice osteopathy and surgery, 3 in Indiana privileged to practice osteopathy, surgery and obstetrics, and 1 in Texas granted unlimited practice.

Diplomates of the National Board of Medical Examiners were licensed in thirty-nine states and Hawaii.

Thirty-nine licentiates of New York secured licenses to continue their practice in New Jersey, Arizona, Connecticut, Delaware, Florida, Idaho, Massachusetts, Mississippi, Montana, Nevada, New Hampshire, North Dakota, Rhode Island, South Dakota, Utah, Vermont, Washington and Wyoming had less than 10 of their licentiates endorsed to other states. None were licensed on the basis of a New Mexico license.

A total of 2,729 physicians secured licenses on endorsement of credentials in 1941. The physicians so licensed and, in addition, 9 osteopaths registered by medical examining boards, are recorded by school of graduation and state or territory where licensed in table 14. Sixty-seven medical schools were represented, as well as seven in Canada, nineteen faculties of medicine and two licensing corporations of other countries, two unapproved medical schools and 33 medical schools now extinct and several osteopathic schools. One hundred and four graduates of Harvard Medical School were registered in twenty-eight states and one of the territories, Northwestern University Medical School had 87 graduates licensed by this method in thirty-one

states and the territories. In fact, more than 50 graduates of each of eighteen schools were so recognized for registration. Those holding credentials on the basis of study abroad (52) but registered on the basis of a state license issued in the United States were registered in seventeen states and the District of Columbia. Fifty-three from schools in the United States no longer in existence migrated to twenty states and the District of Columbia, and 18 from unapproved and osteopathic schools were granted licensure privileges in six states and the District of Columbia.

Of the 2,738 candidates licensed by reciprocity and endorsement, 2,559 were graduates of approved medical schools in the United States, 56 of seven schools

| Totals               | 5,213       | 468                         | 5,681 |

so approved in Canada, 52 graduates of foreign faculties of medicine, 53 of institutions now extinct and 9 each from unapproved and osteopathic schools.

LICENTIATES REPRESENTING ADDITIONS TO THE MEDICAL PROFESSION

Licentiates of 1941 representing additions to the physician population of the United States and its territories and possessions are recorded in table 15. The figures represent candidates examined in 1941 and licensed, also those examined in previous years whose licenses were withheld for lack of internship, citizenship and other technicalities and issued last year, and those without a state license who were during the year certified on the basis of the certificate of the National Board of Medical Examiners, the government services, Canadian and foreign credentials. In the main they represent recent graduates.

TABLE 16.—*Credentials Presented by Physicians for Insurance by Reciprocity and Endorsement 1911*

[illegible]

There were 5,681 additions to the medical profession in 1941. The number removed by death annually approximates 3,700. It would appear that the physician population in 1941 was increased therefore by about 1,900. While it cannot be said that all those licensed are in practice, it may be assumed that the great majority are. The greatest number in any one state were added in New York 993 and 449 in Illinois. More than 300 received their first license in California and Pennsylvania. The states of Indiana, Louisiana, Maryland, Minnesota, Missouri, New Jersey, Tennessee, Texas, Virginia and Wisconsin increased their population of physicians by between 100 and 201. Thirty-one states, the District of Columbia, Alaska, Hawaii, Puerto Rico and the Virgin Islands added fewer than 100.

Of the licentiates constituting additions to the medical profession last year, 5,213 secured their license after examination and 468 by endorsement of credentials.

Figures for six previous years and 1941 are shown in table 17 for comparison. In 1935 there were 5,099 by examination and 411 by endorsement of credentials, a total of 5,510 additions. In 1936 there were 667 more added than in the previous year; in 1937 247 more than in 1936 and 914 more than in 1935. Since 1937 there has been a reduction in the number of those represent-

TABLE 17—*Licentiates Representing Additions to the Medical Profession 1935-1941*

| Year  | Examination | Reciprocity and Endorsement | Total  |
|-------|-------------|-----------------------------|--------|
| 1935  | 5,099       | 411                         | 5,510  |
| 1936  | 5,185       | 421                         | 5,606  |
| 1937  | 5,813       | 411                         | 6,224  |
| 1938  | 5,003       | 401                         | 5,404  |
| 1939  | 4,811       | 401                         | 5,212  |
| 1940  | 5,112       | 405                         | 5,517  |
| 1941  | 5,213       | 468                         | 5,681  |
| Total | 34,447      | 3,436                       | 41,983 |

ing additions to the profession. In 1941 there were 743 fewer than in 1937, when the greatest number were licensed.

In seven years altogether 41,983 received original licenses, 38,447 after written examination and 3,536 by endorsement of credentials. In the same period 63,495 licenses were issued, 43,895 by examination and 19,600 by endorsement of credentials. Of these 21,512 were previously licensed.

Increases in the physician population arranged in nine geographic divisions are shown in table 18. The greatest number, 1,554 were added in the Middle Atlantic states. The East North Central group added 1,183, the South Atlantic 622, the West North Central 608, the Pacific group 440, the New England states 418, the West South Central group 415 and the Mountain states 91. Nineteen were added in Hawaii, 11 in Puerto Rico and 2 each in Alaska and the Virgin Islands.

In table 19 data pertaining to those securing their first medical licenses are arranged by school of graduation. The largest number from any one school was 152 graduates of the University of Illinois College of Medicine. Northwestern University Medical School had 135 of its graduates registered in 1941. Fourteen other schools contributed 100 or more. Of the United States schools, Albany Medical College and the Woman's Medical College of Pennsylvania had the fewest, 19, while only 1 represented University of Montreal Faculty of Medicine. McGill University

Faculty of Medicine added 44 of its graduates to the medical profession in the United States.

From the United States schools there were added to the profession by examination 4,290 graduates and 448

by reciprocity or endorsement, a total of 4,738, from the Canadian schools 90, by examination 85 and without 5. There were 626 graduates of foreign faculties of medicine, 226 from unapproved schools and from a school now extinct.

Altogether there were 5 213 graduates of all schools added to the medical profession in 1941 by examination for licensure and 468 by reciprocity and endorsement a total of 5 681. The number of living physicians in the United States in 1941 was approximately 180,871.

#### STATE REQUIREMENTS OF PRELIMINARY EDUCATION

The minimum requirement for admission to approved medical schools since 1918 has been two years of collegiate training, and since 1938 three years has been

table 20 Alaska, Hawaii and Puerto Rico likewise require two years of preliminary training.

#### REQUIRED HOSPITAL INTERNSHIPS

In tables 21 and 22 are listed the medical schools and licensing boards now requiring internships for the M.D. degree and licensure respectively.

The medical licensing boards of twenty states the District of Columbia, Alaska, Hawaii and Puerto Rico require that all applicants for licensure serve a hospital

recommended. With but four exceptions, namely California, Connecticut, Massachusetts and Nebraska, the state licensing boards also specify two years or more of college as a preliminary requirement. Although their statutes do not conform with the two year requirement the states just named, with the exception of Massachusetts do not license other than graduates of approved schools whose graduates since 1918 have had two years or more of college work preliminary to beginning the study of medicine. This information is given in

internship. The Louisiana board in February 1942 rescinded its rule regarding a year's rotating internship in an approved hospital as a requisite for obtaining a certificate to practice medicine. The present war emergency together with the accelerated curriculum by undergraduate medical schools and the inability to keep an intelligent check on the various hospitals was the reason for dropping the requirement.

Ten medical schools in the United States and three in Canada require completion of an internship before

internship requirement was waived in 1941 because of the national emergency The University of California Medical School has discontinued the requirement of an internship for the seniors of 1941-1942 and, since the school is planning to accelerate the curriculum, it will no longer be a requirement for the M D degree

The University of Minnesota Medical School in 1915 was the first school to adopt the internship as a basis for the M D degree, and the first state exacting this requirement was Pennsylvania in 1914 Several states in addition require graduates of medical faculties abroad and reciprocity or endorsement applicants to have completed an internship These states and schools are recorded in tabulations presented in this group under their respective headings Since 1936 seven schools have dropped the internship requirement, i e Rush Medical College and the University of Chicago School of Medicine in 1936, Louisiana State University School

TABLE 21—Internship Required by Medical Schools

of Medicine in 1940, the University of Cincinnati School of Medicine, the University of Illinois College of Medicine and McGill University Faculty of Medicine in 1941 and the University of California Medical School in 1942 The M D degree is conferred by Duke University School of Medicine after completion of the senior year, but all graduates are required to spend two years in a hospital or laboratory work after graduation In 1941

this school agreed to accept one year of military service in lieu of the second year of internship There have been no recent additions to either table 21 or 22 by institution of the requirement by a medical school or licensing board

## CANDIDATES EXAMINED

The number of candidates examined in the United States its territories and possessions in the five year period 1937-1941 are given in table 23 For each year there is recorded the number who passed and failed licensing examinations Totals for the five year period and the percentage of candidates who failed are also given

During this period 37,985 were tested, of whom 32,006 were successful and 5,979, 15.7 per cent failed Of these 3,414 were examined in New York and passed 2,517 in Illinois 2,513 in Pennsylvania and 1,930 in California More than 1,000 were successful also in Massachusetts Michigan Minnesota, New Jersey and Ohio Nine states examined and passed between 500 and 1,000 applicants for licensure, thirty states and the District of Columbia registered fewer than 500 and in ten of these less than 100 The smallest number 8 passed examinations in New Mexico

The percentage of failures in all states and the territories and possessions has increased from 10.0 in 1937

TABLE 22—Internship Required by Medical Licensing Boards of All Candidates\*

|                      |               |               |
|----------------------|---------------|---------------|
| Alabama              | New Hampshire | Utah          |
| Alaska               | New Jersey    | Vermont       |
| Delaware             | North Dakota  | Washington    |
| District of Columbia | Oklahoma      | West Virginia |
| Hawaii               | Oregon        | Wisconsin     |
| Idaho                | Pennsylvania  | Wyoming       |

| Iowa                 | Rhode Island  |               |
| Michigan             | South Dakota  |               |

\* In addition some states require the internship of graduates of medical faculties abroad and reciprocity or endorsement applicants See tables 13 and 20

to 20.6 in 1940 The number failing in 1941 was 19.7 per cent

The greatest percentage of failures occurred in Massachusetts, which had an average of 48.2 The high percentage in this state is due to the fact that by law the licensing board is required to admit to its examination the graduates of unapproved schools, the majority of whom repeatedly fail New York had a failure percentage of 40.5, occasioned in part by the admittance to examination of a large number of graduates of foreign faculties of medicine who likewise repeatedly failed On the other hand, twenty-eight states failed less than 5 per cent, in twelve of these the percentage of failures was less than 1 In five years seven states—Arkansas, Nebraska North Carolina, Oklahoma, Oregon, Utah, and Wisconsin—had no failures

A total of 37,985 were examined from 1937 to 1941 inclusive of whom 32,006 passed and 5,979, 15.7 per cent, failed

These figures represent examinations given and not individuals A candidate who fails more than once in a given year in a state is counted as only 1 failure, but should he fail in one of the succeeding years he is counted in that year also The same is true of the successful candidates This table is merely a compilation of figures computed annually and grouped for comparison This table gives a fair approximation of the number of physicians added to the profession in

five years by means of written examination. On page 162 is a compilation giving exact figures for the period of 1935 to 1941 inclusive.

## REGISTRATION 1904-1941

A study of totals and percentages for thirty-eight years (1904-1941) will be found in table 24. This tabulation includes figures for each year covering the number examined and passed, the percentage failed, the number registered by reciprocity or endorsement and the total registered. No decided increase was evidenced from 1904 to 1935. However in 1936 and in the following two years there was a noticeable increase while since 1938 the number registered has decreased. The number registered without examination has increased considerably since 1904, owing to the wider recognition of reciprocal relations and the acceptance of the certificate of the National Board of Medical Examiners. The decrease of more than 1,200 in 1918 was due to the sudden withdrawal of physicians and recent graduates

from civilian life during the World War. However in the following year the number registered was 2,389 greater than in 1918. The same situation prevailed in 1941 when 385 fewer were registered although this decrease is also due in part to the fewer graduates of European schools registered as compared with several preceding years.

The greatest number registered in thirty-eight years was in 1937 9,807, of whom 6,604 passed licensing tests and 3,203 were endorsed for registration.

The percentage of failures annually dropped from 193 in 1904, when a great many proprietary medical schools were fluctuating, to 5.7 per cent in 1930.

TABLE 24—Registration 1904-1941

| Year | All Candidates Examined |        |                   | Reciprocity or Endorsement | Total Registered |
|------|-------------------------|--------|-------------------|----------------------------|------------------|
|      | Examined                | Passed | Percentage Failed |                            |                  |
| 1904 | 7,044                   | 5,693  | 19.3              | 1,005                      | 6,698            |

Improvement in the standards of medical education is largely responsible for the decrease in failures before licensing examinations. With the migration of physicians to this country beginning in 1936 and their failure to pass examinations, the percentage of failures began to rise until it reached a peak of 20.7 in 1940. In 1941 it dropped 1 per cent for the country as a whole in spite of the high percentage of failures in New York State. The rise in failure percentages has also been due to the inability of graduates of unapproved medical schools to obtain licensure successfully without failure.

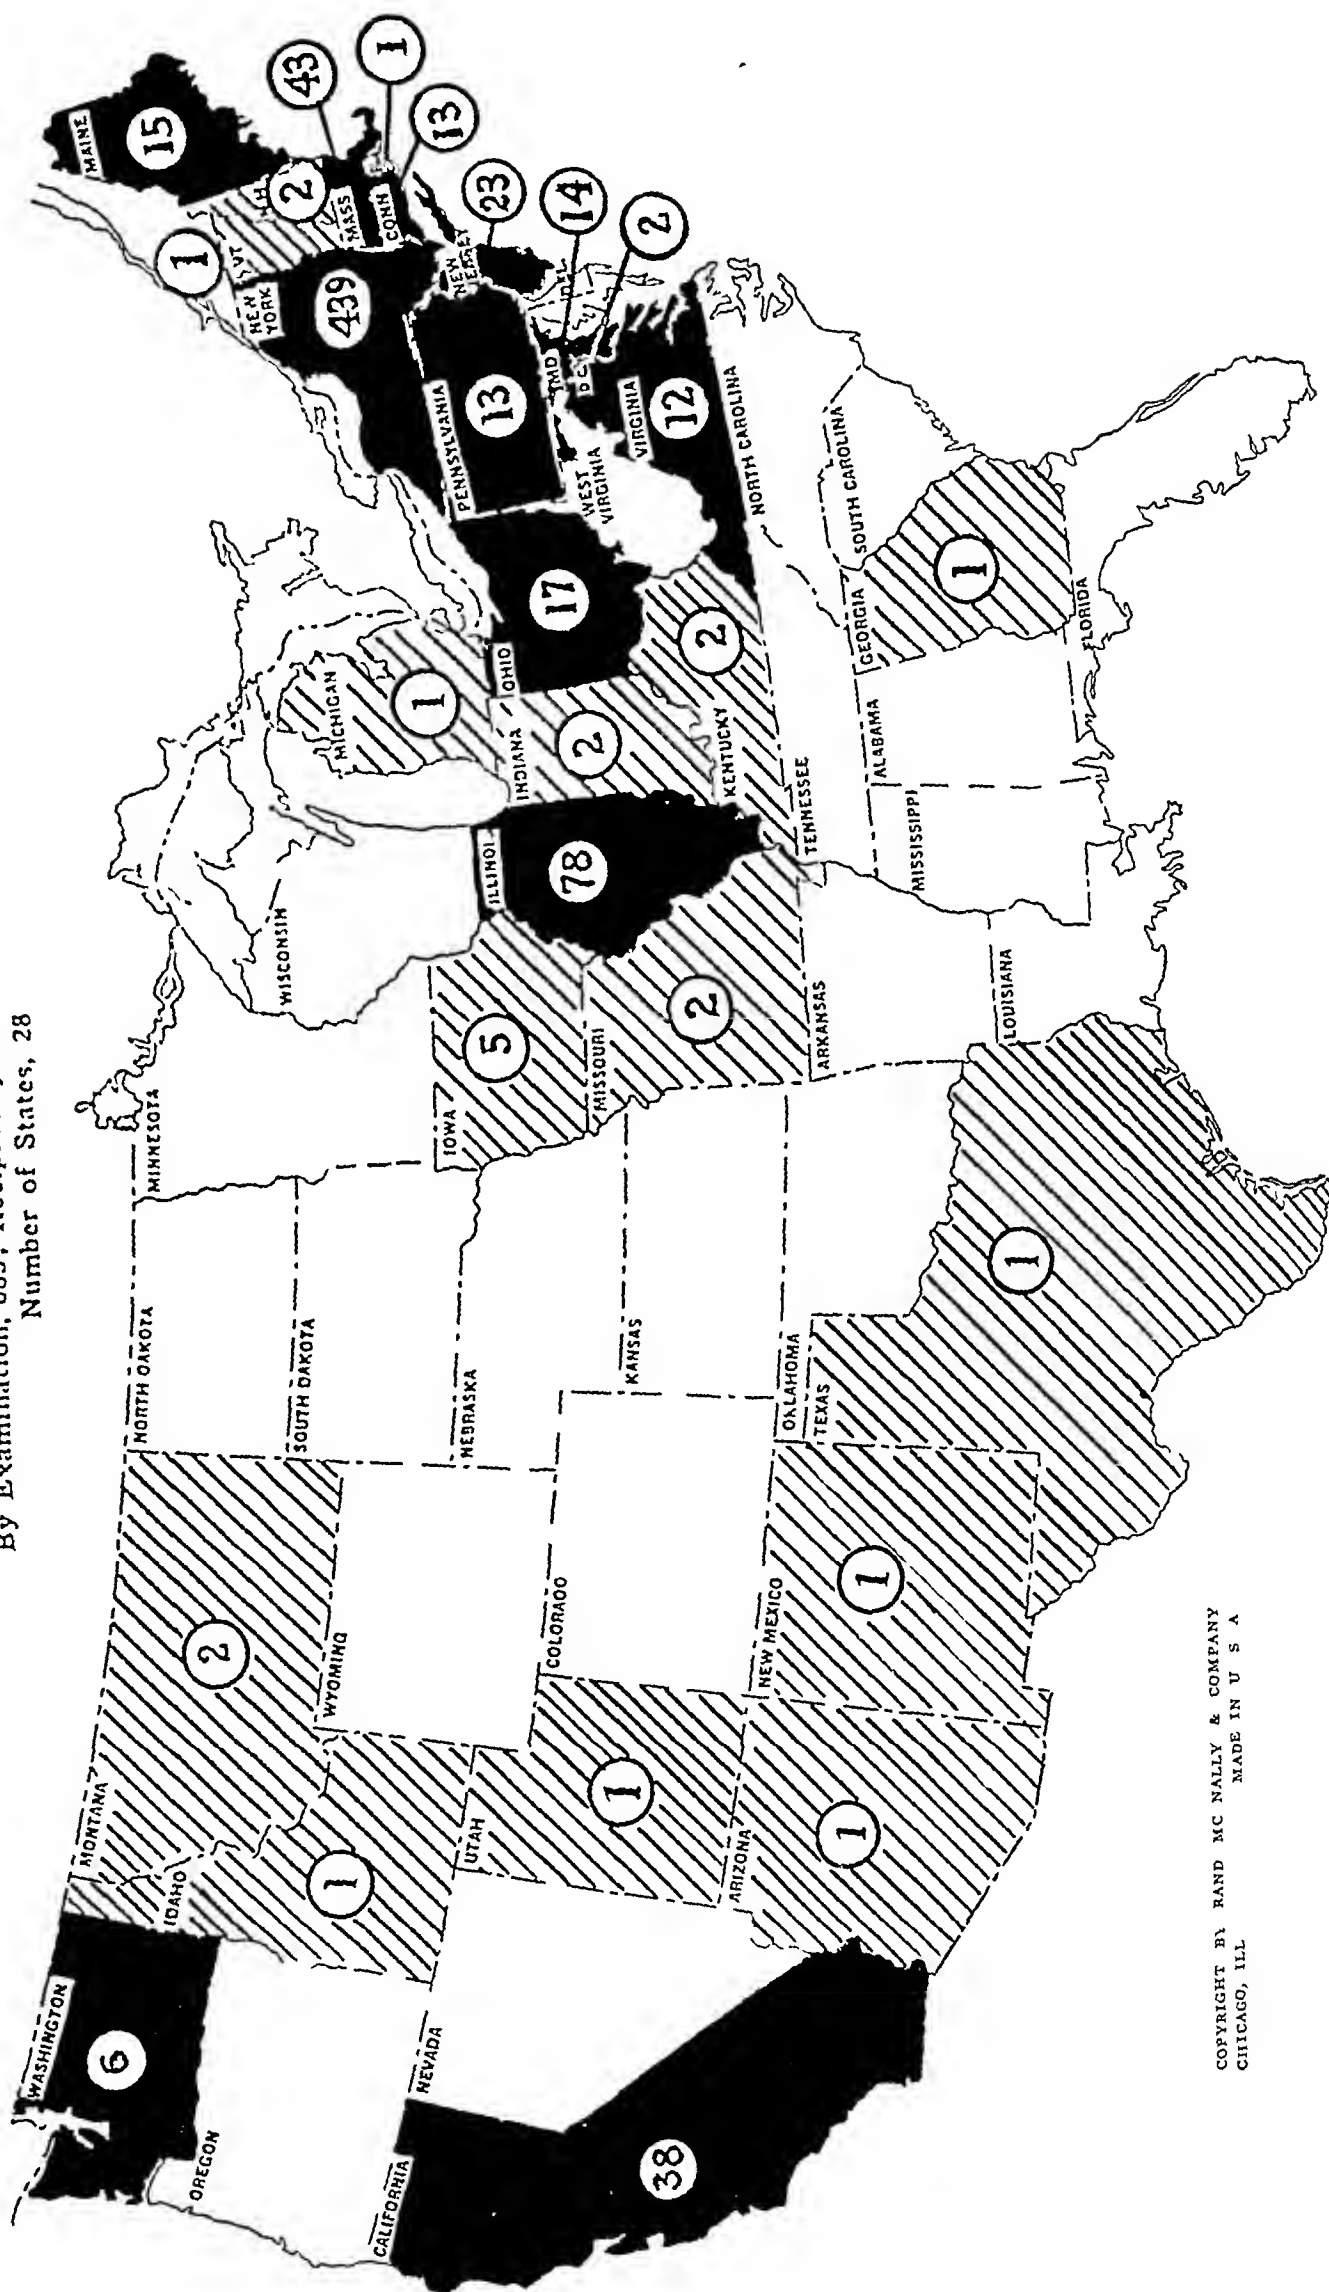

While these figures represent those registered in the years given, they do not represent actual additions to the medical profession even among those who tried the written examination.

GRADUATES OF APPROVED SCHOOLS AND OTHERS  
REGISTERED 1922-1941

The educational fitness of the individuals registered in twenty years is recorded in table 25. In the computation of these figures, schools rated as class A and B by the Council on Medical Education and Hospitals of the American Medical Association since 1907 are classified as approved. In the column "others" are included graduates of institutions prior to 1907, of foreign faculties of medicine, class C graduates, osteopaths given recognition by medical licensing boards and graduates of schools not approved by the Council. In 1928 the classification A, B and C by the Council was discontinued and medical schools have since been classified as approved or unapproved.

The states in black registered more than 5 such candidates those shaded 5 or less

Of the 8768 registered by all methods in 1941, 7,727, 88.1 per cent, represented graduates of approved medical schools and 1,041, 11.9 per cent, the group designated as others.

In twenty years a total of 156,442 were registered including 138,287 approved graduates, 88.4 per cent,

TABLE 25—*Graduates of Approved Schools and Others Registered 1922-1941*

| Year  | Graduates of Approved Schools |          | Others |          | Totals  |
|-------|-------------------------------|----------|--------|----------|---------|
|       | Number                        | Per Cent | Number | Per Cent |         |
| 1922  | 4,519                         | 80.5     | 1,093  | 19.5     | 5,612   |

| 1939  | 8,007                         | 89.2     | 1,256  | 13.8     | 9,263   |
| 1940  | 7,778                         | 89.0     | 1,375  | 15.0     | 9,153   |
| 1941  | 7,727                         | 88.1     | 1,041  | 11.9     | 8,768   |
| Total | 138,287                       | 88.4     | 18,155 | 11.6     | 156,442 |

and 18,155 others 11.6 per cent. The improved standards of medical education are again evident in a study of these totals and in the percentages representing approved graduates. The number of graduates of approved schools in the period shown has always been in the bracket above 4,000, representing more than 80 per cent of those annually registered. The recognition of graduates of approved schools by licensing boards and the consistent refusal of many state boards to recognize graduates from unapproved schools is revealed in the number of others registered. Until the

influx of foreign graduates in 1936 the number in this second group has always been well below 1,000.

Of the 8,768 registered in 1941 there were 5,112 who were graduates of approved medical schools of the United States and Canada licensed by examination and 2,615 licensed without examination. By examination, 221 unapproved graduates and 697 foreign graduates

were registered. Likewise among those registered by endorsement there were 24 graduates of unapproved schools and 99 foreign graduates.

New York registered 735 graduates of approved schools of a total of 1,175 registered. This state licensed the largest number with foreign credentials 439. Only graduates of approved schools in the United States and Canada were registered in Kansas, Minnesota, Nebraska, Nevada, North Dakota, South Carolina and South Dakota.

#### GRADUATES OF UNAPPROVED MEDICAL SCHOOLS REGISTERED 1936-1941

Data regarding the number of graduates of those institutions which do not meet the standards outlined by the House of Delegates of the American Medical Association and enforced by the Council on Medical Education and Hospitals who were registered as medical licentiates in the United States, Alaska, Hawaii and Puerto Rico with or without examination from 1936 to 1941 inclusive are recorded in table 26.

In the six years shown, twenty states, Alaska, Hawaii and Puerto Rico registered 1,057 by examination and 117 by reciprocity or endorsement. In 1941 there were 152 registered in six states namely

California, Illinois, Iowa, Massachusetts, Missouri and New Jersey. Two states, Illinois and Massachusetts, registered 140 of the 152 reported. These statistics include 8 graduates of a school recently dissolved and from which the Council has removed inhibitions formerly made regarding this school. However, they were licensed during the period when the school was not recognized as an approved institution. Chart 1, on page 164, records graphically the number so registered, indicating by shaded lines those states registering fewer than 6 graduates of unapproved schools and by a solid area those registering more than 5 such candidates during 1941.

#### GRADUATES OF SCHOOLS OF OSTEOPATHY REGISTERED BY MEDICAL EXAMINING BOARDS 1936-1941

The number of graduates of schools of osteopathy granted the privilege of practicing medicine, surgery or both by medical examining boards from 1936 to 1941 inclusive are given in table 27. Osteopaths licensed by osteopathic boards and given medical privileges in some form are not included in these statistics. Likewise, excluded are osteopaths licensed by medical boards to practice osteopathy only.

In six years twelve states recognized such individuals and 783 were registered, 579 by examination and 204 by endorsement of credentials.

(CONTINUED FROM PAGE 169)

In 1941 nine states registered 85 by examination and 9 by endorsement of credentials, a total of 94. The number for each state so registered in 1941 is shown graphically in chart 2, page 166, indicating by shaded lines those registering fewer than 6 graduates of osteopathic schools and by a solid area more than 5 such candidates. Massachusetts, New Jersey and Texas registered 74 of the 94 so licensed. Colorado prior to 1941 was one of the four states recognizing the greatest number of such graduates but in 1941 only 2 were licensed.

In six years Texas registered 264, New Jersey 224, Massachusetts 103 and Colorado 92, a total of 683. In six years eight other states licensed altogether 100.

The situation in these states whereby the medical board is by law required to recognize such graduates is as follows:

In Colorado osteopaths have no separate board. They are admitted to examination under the medical practice act for a license to practice medicine. In Connecticut any registered osteopath may practice either medicine, surgery or both as the case may be after passing a satisfactory examination before the medical examining board.

In Indiana the licenses issued to osteopaths authorize the holders to practice osteopathy, surgery and obstetrics.

In Massachusetts the medical practice act by definition includes osteopathy in the practice of medicine and does not differentiate the type of license issued to an osteopathic applicant. The act requires that any applicant for license to practice must be in possession of a degree of doctor of medicine, or its equivalent, from a legally chartered medical school which gives a full four year course of instruction of not less than thirty-two weeks in each year.

In New Hampshire, osteopaths are granted the right to practice medicine and surgery by the Board of Registration in Medicine.

In New Jersey osteopaths licensed prior to Nov. 1, 1941 who furnished proof prior to that date, of having served for a period of two years as an intern or resident surgeon in an osteopathic or medical hospital approved by the state board of medical examiners, of having completed a postgraduate course of two years in a college of osteopathy or medicine approved by the board or of having had at least three years of practice in a hospital approved by the board could be admitted to an examination in pharmacology, therapeutics and surgery and, if the examination was passed could obtain a license to practice medicine and surgery. Since Nov. 1, 1941 all osteopathic applicants who have met the requirements of the medical practice act have received licenses to practice medicine and surgery.

The medical practice act of Texas provides for the issuing of a license to practice medicine only. Osteopaths are issued licenses unrestricted in scope.

In Virginia, osteopaths may obtain the right to perform surgery with the use of instruments if they satisfy the board of medical examiners that they have had "adequate clinical facilities in their respective college of graduation, or by hospital work to enable them to perform such operations."

In Wyoming the statutes contain no specific provision for the licensing of osteopaths. The medical practice act provides that the certificates issued to all applica-

"shall be deemed licenses to practice medicine in all branches in which the applicant has taken examination in this state"

In the District of Columbia Oregon and Wisconsin osteopaths are granted the right to practice surgery

#### PHYSICIANS EXAMINED ON BASIS OF CREDENTIALS OBTAINED IN COUNTRIES OTHER THAN THE UNITED STATES AND CANADA

The requirements of candidates for medical licensure in the United States Alaska Hawaii and Puerto Rico on the basis of credentials obtained in countries other than in the United States and Canada based on data recently received from state boards of medical examiners are given in table 29 Eighteen states report that, because of the inability to evaluate foreign credentials holders of such certificates are not eligible for licensure while one state reported that no new applications have been accepted since Feb 21 1941 Seventeen states Alaska Hawaii and Puerto Rico require full citizenship and ten states first naturalization papers as a condition precedent to taking the examination In some states the requirement is by rule of the medical board, in others the provision is by statute In addition, other restrictions are imposed Ten states which accept foreign graduates require a certificate in the basic sciences Sixteen states, Alaska Hawaii and Puerto Rico require a one year internship in a United States Hospital approved for intern training In five states there is a requirement of a senior year's work in an approved medical school in the United States In four states these graduates are not acceptable unless they can present a license to practice medicine and surgery in the country in which the school of graduation is located In one state a limited number contracting to practice in rural districts may be accepted, while another reports that enemy aliens are not considered

Table 28 presents figures regarding physicians examined on the basis of credentials obtained in countries other than the United States and Canada by licensing boards of the United States, Alaska and Puerto Rico The figures represent both American and foreign born physicians educated abroad Since 1930 and until the issuance of passports was terminated by the Department of State students from the United States migrated to Europe to obtain a medical education It is estimated that 2,000 were so studying in Europe Many were able to complete their training and returned to the United States to practice Many of those licensed in recent years represent foreign born physicians One hundred and four faculties of medicine, including four licensing corporations, of nineteen European and five other countries were represented There were 1,708 examined by twenty states, Alaska and Puerto Rico, of whom 690 passed and 1,018, 59.6 per cent, failed Graduates of the University of Vienna represented the largest group, 479, who were examined in fourteen states with a percentage of failures of 57 Ten states examined 139 graduates of the University of Berlin, of whom 60.4 per cent failed Graduates of all other schools were examined in fewer than ten states The greatest number examined by any one state (1,207) were in New York, of whom 426 passed and 64.7 per cent failed Massachusetts examined 139, of whom 102, 73.4 per cent, failed Illinois examined 119 of whom 34.5 per cent failed More than 25 were examined in 1941 in California Connecticut and New Jersey Of

\* Refer to chart of Reciprocity and Endorsement Policies for further data

1 Certificate of National Board of Medical Examiners and licensure in country in which school of graduation is located

2 Internship or one year in medical school in United States

3 Certificate of National Board of Medical Examiners

4 For graduates of last five years if more than five years \$50

5 Residence of one year in Delaware

6 Provided similar privileges are accorded licensees of District of Columbia by licensing agency of the jurisdiction from which the applicant comes

7 Senior year in class A medical school in United States

8 No applications accepted after Feb 21 1941

9 Enemy aliens not accepted

10 Application must be filed six months prior to date of examination

11 Licensed to practice medicine and surgery in country in which school of graduation is located otherwise required to complete senior year in approved medical school in United States

12 Diplomates of the National Board of Medical Examiners eligible

13 License to practice medicine and surgery in the country in which the school of graduation is located

14 Internship and one year graduate work

15 Diplomates of the National Board of Medical Examiners exempt from special requirements

16 Internship and graduate work

17 Internship completed in foreign countries after July 1 1934 not acceptable

18 Rotating Internship in approved hospital in the United States or completion of senior year in class A medical school in the United States

19 These requirements apply also to graduates of Canadian schools

20 Graduates from foreign medical colleges accepted if they present also a diploma from an approved medical school in the United States

21 Provided standard was the same as California on the same date Council of Delaware required

22 Degree from an American medical college acceptable to the Medical Council of Delaware required

23 Diplomates of the National Board of Medical Examiners accepted

24 Very limited number contracting to practice in rural districts may be accepted

| Totals | 9,688           | 5,093  | 46.9              |

chart are 52 granted licenses without examination, with but 3 exceptions, on the basis of a license obtained in the United States. The states which licensed more than 5 graduates are indicated by states reproduced in black, those shaded, 5 or less.

In table 30 are assembled figures showing for the five year period 1936-1940 the number of graduates of faculties of medicine outside the United States and Canada admitted to licensing examinations in this country. Included also is a tabulation for 1941. There were represented one hundred and nineteen European faculties and nine of the licensing corporations of Great Britain, and sixteen schools of other countries.

During the five year period 1936-1940, 6,451 were examined, with 45.2 per cent failures and, in 1941, 1,708 with 59.6 per cent failures.

The largest group from any one school examined in the five year period were 1,318 from the University of Vienna, of whom 45.7 per cent failed. There were 650 from the University of Berlin, with 44.9 per cent failures. Large numbers also were examined who presented credentials from the universities of Prague, Paris, Freiburg, Frankfurt-on-the-Main, Wurzburg, Munich, Breslau, Heidelberg, Bologna, Naples, Rome, Basel, Bern, Zurich, Geneva and Lausanne. There were 284 in the five year period who presented in lieu

TABLE 32—Annual Registration Required

|             |              |
|-------------|--------------|
| Alaska      | Nebraska     |
| Arizona     | Nevada       |
| California  | New York     |
| Colorado    | North Dakota |
| Connecticut | Oklahoma     |
| Florida     | Oregon       |
| Hawaii      | Pennsylvania |
| Idaho       | Texas        |
| Iowa        | Utah         |
| Kansas      | Washington   |
| Louisiana   | Wyoming      |
| Minnesota   |              |

of the M.D. degree the triple qualification certificate of Scotland. These individuals secured their education in the so-called extramural schools of Scotland.

Table 31 records the number of graduates of faculties of medicine abroad examined for medical licensure in the United States in twelve years, 1930 to 1941 inclusive. Altogether 9,588 were examined, of whom 5,093 passed and 46.9 per cent failed. The greatest number 2,088, were examined in 1940, when 54.7 per cent failed. The number licensed in twelve years

increased from 92 in 1930 to the high peak of 948 in 1940. In 1941, 158 fewer were registered than in 1940. The highest percentage of failures occurred in 1941, 59.6. At no time during this twelve year period did fewer than 30.7 per cent fail.

The Council on Medical Education and Hospitals does not grade or classify medical schools outside the United States and Canada. No opportunity is afforded for visiting and inspecting such schools, nor are official reports received from them. The Council therefore has no evidence on which to base a rating. A list of foreign schools which has been published from time to time merely serves as a key to the American Medical Directory and indicates the names of the institutions which physicians now licensed to practice in the United States attended or from which they graduated. In the next edition because of the inability to verify claims of foreign degrees, it is planned to indicate by the symbol ° that the information given is the licensing board's record of the credential submitted to and accepted as meeting the educational qualifications for licensure. It may be assumed that for those without this symbol there has been official verification received.

#### ANNUAL REGISTRATION

Twenty-one states, Alaska and Hawaii, as shown in table 32, require that all physicians register annually. Some of these states require such registration whether or not physicians reside in the state. The fee for registration is generally \$2.

#### APPROVED EXAMINING BOARDS IN MEDICAL SPECIALTIES

The House of Delegates of the American Medical Association in 1933 authorized the Council on Medical Education and Hospitals to formulate standards and approve examining boards in the medical specialties. The resolution urged that the machinery of the American Medical Association, including the publication of the American Medical Directory, be used in furthering the work of boards accredited under this plan.

Standards governing approval of specialty boards were compiled by the Council and approved by the House of Delegates in 1934. In addition to regulations relating to the organization and operation of specialty boards, the Essentials of Approved Examining Boards in Specialties contains also the minimum qualifications deemed necessary for certification as a specialist. The latter include graduation from an approved medical school, an internship in a hospital approved by the Council and a period of specialized training in a selected field.

Examining and certifying boards had already been established in ophthalmology (1917), otolaryngology (1924), obstetrics and gynecology (1930) and dermatology and syphilology (1932), but the resolution was introduced in 1933 in the belief that there was need for a universal standard governing all fields of medical practice in order that properly qualified physicians might readily be recognized.

Eleven boards have been organized since 1933. These boards, together with the four previously operating, are now fully approved by the Council and represent the specialties of anesthesiology, dermatology and syphilology, internal medicine, neurologic surgery, obstetrics and gynecology, ophthalmology, orthopedic surgery, otolaryngology, pathology, pediatrics, plastic surgery, psychiatry and neurology, radiology, surgery and urology.

The American Board of Internal Medicine by special examination certifies specialists in allergy, cardiovascular disease, gastroenterology and tuberculosis. Similarly the American Board of Surgery certifies specialists in proctology.

Approved Examinations Boards in Medical Specialties

| 11            | American Board of Otolaryngology                 | 1921                     | 1,181                            | 1,149         |
| 12            | American Board of Surgery                        | 1917                     | 1,674                            | 1,916         |
| 13            | American Board of Anesthesiology                 | 1918                     | 106                              | 110           |
| 14            | American Board of Plastic Surgery                | 1917                     | 111                              | 126           |
| 15            | American Board of Neurological Surgery           | 1910                     | 67                               | 107           |
| Totals        |  |                          | 17,682                           | 19,425        |

Certification in the subspecialties. By the American Board of Internal Medicine: Allergy, cardiovascular disease, gastroenterology, tuberculosis. By the American Board of Surgery: Proctology. Total certified in the subspecialties, 484.

A key number has been assigned to each approved specialty board such as A B 1, and the biographic records of physicians published in the American Medical Directory include by this means reference to those certified by these boards.

The identifying numerical symbols of the boards, the number of certificates awarded prior to March 1, 1941 and those certified from that date to March 1, 1942 respectively appear in the accompanying tabulation. On March 1, 1941 there were 17,682 physicians certified by these fifteen approved boards and in the following year 1,756, excluding the subspecialties, a total of 19,425 as of March 1, 1942. In the subspecialties 484 have been registered, namely allergy 59, cardiovascular disease 221, gastroenterology 99, proctology 46 and tuberculosis 105. In internal medicine 2,556 have been certified and in surgery 1,912. The greatest number certified by any one board were the 3,349 physicians certified in otolaryngology since the organization of this board in 1924. While the board in pediatrics has been operating only since 1933, to date 1,784 have been certified as specialists. Radiology, organized in 1934, has recognized 1,699 as specialists. The oldest board in existence, ophthalmology (1917), has certified 1,970.

The future training of young men to meet the requirements of the specialty boards will be greatly curtailed since no provision has been made for military deferment beyond the internship. The Advisory Board for Medical Specialties and the Council on Medical Education and Hospitals of the American Medical Association have appointed a committee to formulate plans to submit to the military authorities whereby a percentage of interns may be given an opportunity to continue their training in the special fields of medicine.

For the current emergency the specialty boards in anesthesiology, dermatology and syphilology, internal medicine, orthopedic surgery, pediatrics, psychiatry and neurology and radiology will permit one year of military service to be applied toward the satisfaction of one year of graduate training. Urology does not give routine credit for military service but

may grant a credit of one year toward the requirement of two years of private practice. An applicant entering military service and assigned to work in general surgery may receive credit toward the required special training up to a maximum of six months by the American Board of Obstetrics and Gynecology. The surgical board will accept service in a military hospital in lieu of an equal amount of time spent in a civil hospital as a resident. Boards in ophthalmology, otolaryngology and pathology will consider each case individually on its own merits. Allowance for military service is under consideration by the boards in neurologic and plastic surgery.

BASIC SCIENCE BOARDS

Basic science requirements underlying the practice of the healing art have been created by legislative action in sixteen states and the District of Columbia. These acts provide certification by a board of examiners in the basic sciences as a prerequisite to eligibility for a license to practice any branch of the healing art, whether the license is to be issued after written examination or on the basis of endorsement of credentials or reciprocity. Connecticut and Wisconsin, in 1925, were the first states to enact laws. The most recent addition to the list, and the only new one added in 1941, was New Mexico. While the basic science laws in some states include reciprocal agreements, the certificate is obtainable only after examination in the majority of instances.

In 1941 basic science boards were in operation in Arizona, Arkansas, Colorado, Connecticut, the District of Columbia, Florida, Iowa, Michigan, Minnesota, Nebraska, New Mexico, Oklahoma, Oregon, Rhode

TABLE 1—States Having Basic Science Laws and Year of Enactment

Island, South Dakota, Washington and Wisconsin. The years in which the various laws were enacted are shown in table 1.

Shown in table 2 are the subjects in which examinations are conducted by the respective states and the District of Columbia. The subjects included in basic science examinations are specified by the statutes. The

examining boards may neither add to nor subtract from such subjects. All boards examine in anatomy, pathology and physiology; fifteen examine in chemistry, thirteen in bacteriology, eight in hygiene, two in diagnosis and one in public health.

Applicants examined during 1941 are presented in four groups in table 3, namely, physicians or medical students, osteopaths, chiropractors and unclassified applicants. Included among those unclassified were 17 doctors of dentistry examined in Rhode Island and 3 naturopaths, 2 examined in Connecticut and 1 in Iowa. For the remainder it was not possible to determine what profession they represented. In applying for a basic science certificate it is not necessary in most of the states to mention the school of practice, but by checking the biographic records of the American Medical Association and various directories it has been possible to determine the profession of the majority of candidates.

\* School of practice undeterminable since names of failures not supplied.

There were 2,148 candidates in the various groups examined last year by the seventeen boards named. Of this number 1,768 were doctors of medicine or medical students, 151 osteopaths, 16 chiropractors, and 189 were placed in the unclassified group. Of all applicants examined, 1,751 passed and 397, 18.5 per cent failed. Of the physicians examined 11.8 per cent failed, osteopaths 36.4 per cent, chiropractors 68.8 per cent and unclassified 52.4 per cent. Among those who passed there were 1,560 physicians, 96 osteopaths, 5 chiropractors and 90 who were unclassified. Ten doctors of dentistry passed but none of the naturopaths. Iowa examined the greatest number, 295, of whom 35.6 per cent failed. The next largest number, 264, were examined in Minnesota, with 18.9 per cent failures. One other state examined more than 200, Florida, of whom 13.0 per cent failed.

Osteopaths were examined in Arizona, Colorado, Connecticut, Florida, Iowa, Michigan, Minnesota, Nebraska, Oregon, Rhode Island, Washington and Wisconsin—twelve states. Chiropractors appeared for examination in only six states—Connecticut, Florida, Minnesota, Oklahoma, Washington and Wisconsin.

The highest percentage of failures, 36.4, was in Arizona, which examined 66 individuals. It is the policy of the Arizona Board of Examiners in the Basic Sciences to omit the names of applicants who fail

examinations, and the law does not require the board to record the professional school of graduation of the examinees. The failures for this state therefore are recorded in the total column only.

Four other states had more than 25 per cent of their candidates fail, while the District of Columbia reported no failures.

The number of certificates (2,103) issued by examination, reciprocity and endorsement are recorded in table 4. A total of 1,751 were granted after examination, 1,560 were issued to physicians or medical students, 96 to osteopaths, 5 to chiropractors and to 90 persons who were unclassified. There were also 352 certified without examination by reciprocity and

| 1941   | 17   | 1 763    | 1 560  | 203    | 11.5                 | 279                               | 1 839                               | 346    | 191    | 165                  | 46.3                              | 75  | 264   |
| Totals | 13   | 5 521    | 4 961  | 1 621  | 11.9                 | 2 862                             | 14 822                              | 1 786  | 566    | 970                  | 51.5                              | 480 | 1 466 |

endorsement representing 279 physicians, 44 osteopaths, 2 chiropractors and 27 in the unclassified group.

Minnesota certified 90 without examination, the greatest number of whom 70 were physicians, 6 osteopaths and 14 unclassified. Arizona, Florida and Washington have no reciprocal relations. None were certified by this method in Connecticut, New Mexico or Rhode Island. Osteopaths were registered in all states but Arizona. Connecticut, the District of Columbia, Ne-

braska, New Mexico, Oklahoma, Rhode Island and Washington while chiropractors were registered by this method in but two states—Arkansas and Wisconsin.

Altogether, 2,103 individuals received basic science certificates in 1941 in seventeen states, ranging from 9 in New Mexico to 304 in Minnesota.

Table 5 shows the number of candidates examined and certified by basic science boards in fifteen years, 1927 to 1941 inclusive. In 1928 when five boards were functioning there were 646 physicians examined, of whom 9.3 per cent failed and 59 other practitioners of whom 47.5 per cent failed. In 1941, by comparison, 1,768 were examined of whom 11.8 per cent failed and 350 other practitioners 46.3 per cent of whom failed. During the fifteen year period a total of 13,582 physicians or medical students were examined, of whom 11,961 passed and 1,621, 11.9 per cent failed, while in the same period 1,786 other practitioners were examined of whom 866 passed and 920, 51.5 per cent, failed. During this period also 2,862 physicians and 480 other practitioners were certified without examination.

Altogether 16,469 certificates have been issued by basic science boards since 1927, of which 14,823 were granted to physicians or medical students and 1,346 to other practitioners. In this period also 13,582 physicians or medical students were examined, of whom 11,961 were registered and 1,786 other practitioners, of whom only 866 were registered. Since 1927, 2,862 physicians and 480 others received certificates by reciprocity and endorsement.

From the high percentage of failures in the other practitioners group it seems apparent that the enforcement of basic science laws affects mostly this group. The object of basic science legislation is to provide a means of insuring that all candidates seeking the right to care for sick and injured people shall first possess a reasonable knowledge of the sciences fundamental to the healing art.

### NATIONAL BOARD OF MEDICAL EXAMINERS

The National Board of Medical Examiners was founded in 1915 by Dr. W. L. Rodman, then President of the American Medical Association, and chartered on March 17, 1922 under the laws of the District of Columbia. Its purpose was to establish in this country a qualifying examination of such high character that successful candidates could be safely admitted to the practice of medicine without further examination. Its membership at present numbers twenty-nine, representing the three federal services, the Federation of State Medical Boards of the United States, the Association of American Medical Colleges, the Council on Medical Education and Hospitals of the American Medical Association and fourteen members elected at large.

The fulfillment of the ideals of its founder is evidenced by the fact that the certificate of the National Board is accepted as an adequate qualification for a medical license by the licensing authorities of the District of Columbia and all states except Florida, Louisiana, Texas and Wisconsin. It is also accepted by the territories of Alaska, Hawaii, Puerto Rico and the Canal Zone. The states, territories and possessions which will endorse certificates of the National Board of Medical Examiners are recorded in table 1.

The only additional examinations required of those who hold the certificate of the National Board by the

states mentioned are oral examinations in Connecticut, Illinois, Maine, Montana, Rhode Island and Wyoming, and a supplemental written examination in Michigan. California requires that the certificate of the National Board must be dated not less than one year prior to applying for a medical license. Pennsylvania requires a rotating internship.

TABLE 1—States Endorsing Certificates of National Board of Medical Examiners

|                   |               |                |                |
|-------------------|---------------|----------------|----------------|
| Alabama           | Illinois      | Nebraska       | Puerto Rico    |
| Alaska            | Indiana       | Nevada         | Rhode Island   |
| Arizona           | Iowa          | New Hampshire  | South Carolina |
| Arkansas          | Kansas        | New Jersey     | South Dakota   |
| California        | Kentucky      | New Mexico     | Tennessee      |
| Canal Zone        | Maine         | New York       | Utah           |
| Colorado          | Maryland      | North Carolina | Vermont        |
| Connecticut       | Massachusetts | North Dakota   | Virginia       |
| Delaware          | Michigan      | Ohio           | Washington     |
| Dist. of Columbia | Minnesota     | Oklahoma       | West Virginia  |
| Georgia           | Mississippi   | Oregon         | Wyoming        |
| Hawaii            | Missouri      | Pennsylvania   |                |
| Idaho             | Montana       |                |                |

The examinations of the National Board in the basic sciences are accepted in lieu of the examinations in these subjects given by the basic science boards of Connecticut, Iowa, Minnesota, Nebraska and the District of Columbia. Diplomates are admitted to the final examination of the Conjoint Examining Boards of England and Ireland and the Triple Qualification Board of Scotland. The certificate is accepted by the United States Public Health Service in lieu of the usual written examination. Diplomates are admitted to the Mayo Foundation without further examination. Finally the certificate is recognized as a credential of merit by hospital boards and by various medical organizations including faculties of medical schools and examining boards in the medical specialties.

In the following paragraphs data are presented for the twenty-fourth consecutive year regarding the examinations conducted and the issuance of certificates by the National Board of Medical Examiners. These statistics are based on official reports received periodically from the executive office of the National Board.

The early development of the work of the National Board was materially affected by the participation of the United States in the World War, but since 1922 the number obtaining the certificate has been steadily increasing.

TABLE 2—Examinations, 1916-1921

| Date          | Total Examined | Failed | Percent Failed |
|---------------|----------------|--------|----------------|
| October 1916  | 10             | 5      | 50.0           |
| June 1917     | 12             | 3      | 25.0           |
| October 1917  | 28             | 6      | 21.4           |
| January 1918  | 20             | 2      | 10.0           |
| April 1918    | 25             | 5      | 20.0           |
| December 1918 | 16             | 1      | 6.3            |
| June 1919     | 52             | 1      | 1.9            |
| February 1920 | 48             | 12     | 25.0           |
| May 1920      | 60             | 14     | 23.3           |
| February 1921 | 16             | 5      | 31.3           |
| June 1921     | 40             | 3      | 7.5            |
| Totals        | 325            | 57     | 17.5           |

From October 1916 to Dec. 31, 1921 eleven examinations were held and 268 candidates were certified. The results of each examination during this period are given in table 2.

Since 1922 the examination has been given in three parts in the following sequence: part I, a written examination, in each of the six fundamental medical sciences; part II, likewise a written examination, in five main

clinical subjects, and part III, the clinical preparation of the candidate after one year's internship. Examinations in parts I and II are held in February, June and September at approved medical schools provided there are at least 5 candidates available and part III examinations are held at times sufficiently frequent to accommodate all eligible candidates in twenty-two established centers throughout the United States.

The tables hereinafter presented enumerate the results of examinations in parts I, II and III for each calendar year since 1922, including those who passed and failed examinations, and those certified.

Candidates are required to take all six subjects of part I at a regular examination period unless entitled to take an incomplete examination or electing to take a divided examination. An incomplete examination is allowed candidates taking part I at the end of their second year in schools whose third year curriculum include courses in one or two subjects of this part. The examinations in the subjects not yet completed are therefore postponed and may be taken at any exami-

TABLE 3—Examinations in Part I in 1941 and 1922-1941

| Date          | Total Examinations | Passed        | Incomplete   | Failed       | Per centage Failed |

| <b>Totals</b> | <b>22,400</b>      | <b>14,219</b> | <b>5,700</b> | <b>2,421</b> | <b>10.8</b>        |

nation period after the candidate has completed them in his medical school. Any candidate not entitled to take an incomplete examination in part I may, if he so elects, take a divided examination by writing any four subjects at one time and the remaining two within thirteen months, but after at least one semester of study. Incomplete examinations have been enumerated in subsequent tabulations but were not included in percentage computations. Those electing to take a divided examination are excluded from the statistical presentations until reported as having passed or failed the complete examination.

A candidate who fails to make an average of at least 75 per cent in three or more main divisions of part III is required to repeat those divisions. In such case the candidate is "referred" and required after a three months interval to pass a reexamination. Referred candidates are likewise excluded from the statistics.

Three examinations in part I were held in 1941, and four in part II. The results of these examinations, together with totals for twenty years, are included in tables 3 and 4. The figures cover the totals of each examination given during a calendar year and include some who fail and are reexamined during the same year and also some who pass parts I and II in the same

year. They represent therefore examinations conducted rather than individuals examined.

Altogether, 1,640 examinations were given in part I in 1941, of whom 1,087 candidates passed and 207, 12.6 per cent failed. In 1941 also 346 incomplete examinations were given in part I. In 1941, 1,001 examinations were held in part II. There were 954

successful examinations and 46, or 4.6 per cent, failures. One candidate was reported as having taken an incomplete examination.

Since 1922 a total of 22,400 examinations have been given in part I and 12,085 in part II. During this period, 14,219 passed part I and 11,050 part II. In twenty years there have been 2,421 failures in part I, 10.8 per cent, and 391 failures in part II, 5.2 per cent.

TABLE 5—Examinations in Part III, 1922-1941

| 1939          | 770                | 729          | 41         | 5.3               |
| 1940          | 791                | 770          | 21         | 2.7               |
| 1941          | 910                | 885          | 25         | 2.7               |
| <b>Totals</b> | <b>9,215</b>       | <b>8,824</b> | <b>391</b> | <b>4.2</b>        |

Between 1916 and 1921 a total of 325 were examined of whom 268 passed and 57, 14.3 per cent failed. Total certificates awarded up to and including 1941, 9,092.

From 1922 to 1941 inclusive, 5,760 took incomplete examinations in part I and 46 in part II.

The results of examinations in part III for the twenty year period 1922 to 1941 inclusive are given in table 5. In 1941, 910 were examined as compared with only 22 in 1922. This was the greatest number examined in any one year. Of those examined in 1941, 25, or 2.7 per cent, failed. In twenty years 9,215 were examined, of whom 8,824 were granted certificates and 391,

42 per cent, failed Between 1916 and 1921, certificates were awarded to 268 candidates Altogether from 1916 up to and including 1941, 9,092 certificates have been awarded Physicians who earn the certificate are designated Diplomates of the National Board and are privileged to use the designating initials D N B

The number of individuals examined during any one year is given in table 6 The classification as passed or failed, in cases in which more than one examination has been taken in a given year, was based on the results of the last examination during the year in question For example, if in 1941 a candidate passed part I but later in 1941 failed part II he is listed as having failed Figures computed on this basis indicate there were 3,318 who took at least one of the examinations of the National Board of Medical Examiners during 1941, as compared with 525 in 1922 A total of 40,486 individuals were examined in one or more of the examinations in the twenty years shown of whom 31,638 passed 5,520 took incomplete examinations and 3,328, 82 per cent, failed

Physicians certified as diplomates in 1941 numbered 885, representing graduates of fifty-five medical schools

TABLE 6—Parts I, II and III, Excluding Duplications 1922-1941

in the United States and three in Canada and of twenty-four faculties of medicine abroad Table 7 records the number of diplomates from each school certified last year Six medical schools require students to take part I of the examination of the National Board at some time before receiving their medical degree, namely, the College of Medical Evangelists, Yale University School of Medicine Boston University School of Medicine the New York Medical College Flower and Fifth Avenue Hospitals Albany Medical College and the University of Buffalo School of Medicine More than 34 of the graduates of each of these schools have become diplomates of the National Board in 1941 In addition the graduates of Georgetown University Medical School Northwestern University Medical School Harvard Medical School, Tufts College Medical School Albany Medical College and Duke University School of Medicine represented the majority of those certified last year The greatest number 80 were graduates of Tufts College Medical School

Diplomates licensed on the basis of their credentials, increased from 2 in 1917 to 714 in 1941 6,870 having been so licensed since the National Board was formed However 9,092 have received the certificate of the board In 1941 diplomates were licensed on the basis

of their National Board Certificate in thirty-eight states, the District of Columbia, Alaska and Hawaii The number so registered in each state are recorded in table 8

As the accelerated war emergency curriculums in the medical schools of the country take form the National Board of Medical Examiners will adjust its examination schedule, which will be satisfactory to all con-

cerned No change in the examination schedule for the present year seems at present to be necessary

At the meeting of the Executive Committee of the National Board of Medical Examiners held on Feb 15, 1942 the following resolution was adopted

*Resolved*, That, beginning February 15, the National Board of Medical Examiners will not accept applicants for admission to its examinations from graduates of any medical school in continental Europe or from graduates of the extramural schools of Scotland and Ireland

TABLE 8—Licenses Granted on the Basis of National Board Certificate 1941

This action does not apply to graduates of universities in the British Isles or to those candidates who had registered before Feb 15, 1942

One of the factors that caused the board to take this action was the refusal of approximately one half of the states of this country to grant licenses to physicians trained in European medical schools even though they had been certified by the National Board

## MEDICAL LICENSURE EXAMINATIONS

The results of the state licensing examinations published in this issue of THE JOURNAL are striking evidence of the lack of uniformity of standards of licensure among the various states. Seven states reported not one failure in their 1941 licensing examinations, indeed, they had not had a failure in the past five years. Twelve additional states have reported failures of less than 1 per cent during the same period. Other states, notably New York, have each year reported a high percentage of failures.

In New York 21.8 per cent of the graduates of the New York State medical colleges who tried the New York State licensing examinations failed, while 39.4 per cent of the graduates of other approved medical colleges in the United States who tried these same examinations failed. Of the 145 graduates of New York State medical colleges who tried licensing examinations in other states, four, or 2.8 per cent, failed.

The lack of uniformity of results in some states is made more obvious by the fact that a candidate is passed if he receives an average of 75 per cent and is not below 50 per cent in any subject. Furthermore, in case of failure in not more than two subjects the applicant may be entitled to another examination in the subjects failed and is considered conditioned and is not reported as a failure.

Paradoxically, New York which reported the highest percentage of failures among the graduates of approved medical colleges on its own examinations, issued a greater number of licenses on the basis of credentials without examination than did any other state.

In spite of this lack of uniformity, the fact is striking that the graduates of the foreign medical schools and the unapproved schools in the United States showed the highest percentage of failures, 59.6 and 46.0 respectively. Six states licensed graduates of unapproved schools during 1941. Four states granted unlimited licenses to practice medicine to graduates of osteopathic schools.

The best interests of the public and of the medical profession seem to demand serious thought right now on the establishment of uniform standards of licensure. These not only would facilitate the migration of qualified physicians from one state to another but would offer to the public greater assurance of the training and competence of practicing physicians. War conditions, involving as they do the migration of great masses of the population including physicians, emphasize the great need for such uniformity.

Is it unreasonable to hope that all states will sometime be willing to maintain standards high enough to make such uniformity possible?

## ABSORPTION OF SURGICAL GUT

In this issue of THE JOURNAL appears a report of the Council on Pharmacy and Chemistry which is a synopsis of the results of a comprehensive investigation conducted over a period of five years on the absorption of catgut sutures. This study was initiated and carried on by Jenkins and his co-workers at the University of Chicago, Department of Surgery, under the auspices of the Council. The work that has thus far been done on this subject is being published in detail under the names of the investigators in the *Archives of Surgery*<sup>1</sup> in four consecutive instalments, the first of which appears in the May issue.

The term "catgut," as commonly applied to surgical sutures, is essentially a misnomer for the sheep intestine which is used. The name "surgical gut" adopted for the U. S. Pharmacopeia is a fundamental improvement in terminology. The classification of this material adopted for the U. S. P. XII recognizes four different types (designated A, B, C and D), which are approximately equivalent to the older terminology of plain, ten day chronic, twenty day chronic and forty day chronic catgut.

The investigators made a detailed experimental study of a large series of catgut suture implants in the abdominal muscles of dogs and a few clinical tests on surgical patients in order to obtain further data on the duration of tensile strength and the time required for ultimate absorption in the tissues of both the plain and the chromic types of this material. Ten standard brands of suture material, in various sizes, were examined. Specimens of the same material were also subjected to *in vitro* digestion tests performed in an incubated acid pepsin solution to correlate the time required for artificial digestion with the period over which the sutures

<sup>1</sup> Jenkins H. P. and Hrdina L. S. Absorption of Surgical Gut (Catgut). I. The Decline in Tensile Strength in the Tissues. *Arch Surg* 44: 881 (May) 1942. II. Pepsin Digestion Tests for the Evaluation of the Duration of Tensile Strength of Surgical Gut in the Tissues. *ibid* June 1942. Jenkins H. P., Hrdina L. S., Swisher F. M. and Owens F. W. III. The Duration of Surgical Gut in the Tissues After Loss of Tensile Strength. *ibid* July 1942. Jenkins H. P. IV. Recommendations for the Absorbability and Digestibility Specifications of Surgical Gut. *ibid* August 1942.

actually retain their holding power in the tissues. The time required for complete absorption of the implanted specimens was determined from a gross study of the cleared tissues removed from the animals, killed after varying periods of exposure. The response of the tissues to the sutures was observed from a microscopic study of the corresponding sections. The investigation shows that for the most part the plain catgut examined maintained its tensile strength in the tissues for an average of approximately five days. Various sizes of the twenty day and forty day chromic material fell into three categories: that which did not maintain tensile strength for ten days, that which lasted ten to fifteen days and that which held up for fifteen to thirty days. The time observed for ultimate absorption falls into two main categories: "rapidly absorbed" (one to three weeks) for plain catgut, associated with a predominant leukocytic tissue response, "slowly absorbed" (three to six months) for chromic catgut, associated with a more conspicuous macrophage response. Some of the chromic, and even some plain, material was "intermediately absorbed." Correlation of the tissue studies with the *in vitro* enzyme tests indicates that the latter offer a practical method of assaying the absorption qualities of surgical gut, provided a check is made with experimental and clinical observations and care is taken to use a uniform enzyme solution.

Specifications are proposed for both the absorbability and the digestibility of each of the four types of surgical gut to be recognized in the U. S. Pharmacopeia XII, though it is indicated that division of surgical gut into four types is somewhat arbitrary, since the studies suggest only three general classes. The specifications provide for time data, in days, of the average range and the minimum and maximum ranges of duration of tensile strength and the average range in weeks or months for complete absorption in the tissues, and for digestibility values of the average range and the minimum and maximum ranges expressed as multiples of the average digestion time of type A (plain) surgical gut to be determined from pooled catgut of this type, which has an average duration of tensile strength of approximately five days.

The primary aim of the studies now being published is to stimulate the ultimate elaboration of suitable standards and methods of testing for surgical gut. The specifications formerly used under the older designations of the material, namely "plain," "ten day," "twenty day" and "forty day," will no doubt be followed to some extent by manufacturers in labeling their products with the new terminology. Such practice will probably soon be generally superseded by more reliable testing methods of surgical gut, designed to insure accurate classification within reasonably broad standards, to enable the surgeon to evaluate better the uses of this suture material in the apposition of tissues.

## Current Comment

### ADDITIONS TO THE MEDICAL PROFESSION

Perhaps the most accurate index of actual additions to the medical profession of the United States is to be found in the medical licensure statistics collected by the Council on Medical Education and Hospitals of the American Medical Association and published annually in the State Board Number of *THE JOURNAL*. The number of graduates of the medical colleges of the United States includes a certain number of students from foreign countries and does not include students from the United States graduating from Canadian medical schools. Neither does it indicate the graduates of the foreign medical schools who initiate practice in the United States. Data presented elsewhere in this issue indicate that there were 5,681 additions to the medical profession in 1941. The number lost to the profession each year by death is approximately 3,700. There has thus occurred during 1941 a net increase of approximately 1,900 in the number of physicians in the United States. Of these 5,681 newly licensed physicians, 626 were graduates of foreign medical schools and 226 were graduates of unapproved medical colleges in the United States. During 1941, 4,738 graduates of approved medical colleges were added to the profession in the United States. Accumulated data indicate that during the past seven years there have been 41,983 new additions to the profession. As a result of increases in the number of students admitted and the adoption of an accelerated curriculum by most of the medical colleges, the annual additions to the profession from the medical schools of this country should increase by more than 25 per cent during the next few years.

### PHENOL-CAMPBOR FOR "ATHLETE'S FOOT"

In *THE JOURNAL*, Dec 6, 1941, a clinical note by Francis<sup>1</sup> on the use of a mixture of phenol and camphor for the treatment of "athlete's foot" was published. This preparation consists of 3 cc of U. S. P. phenol and 3 Gm of U. S. P. camphor, the entire mass being rubbed together in a mortar until it is liquefied. An alternate formula proposed in the communication was three parts of phenol and one part of camphor. Although the mixture is purported to be nonirritating to the skin, the communication warned that the phenol-camphor preparation should not be applied to the wet skin, since water has been reported to permit a release of the phenol with the result that it becomes caustic. More attention has now been drawn to this treatment by the appearance of an article in the May 1942 issue of the *Reader's Digest* entitled "A Working Cure for Athlete's Foot." The medical and pharmacy professions have received many requests for prescriptions and compoundings of the phenol-camphor mixture. Most cases of fungous infection require persistent skilful attention if the disease is to be brought under complete control. Recommendation that untrained people use on themselves

<sup>1</sup> Francis, Edward. Phenol Camphor for "Athlete's Foot." *J. A. M. A.* 117: 1973 (Dec 6) 1941.

agent which has the potential danger of causticity is highly doubtful. According to information received by THE JOURNAL and the office of the Council on Pharmacy and Chemistry, a number of investigations are now being conducted to determine the extent of the causticity of the phenol-camphor mixture and its possible benefits and dangers. This has become doubly imperative because of the response of the public to the article in the *Reader's Digest*. Other factors which have been suggested as meriting consideration are the possible aggravation of an existing irritation and the absorption of phenol if the medicament is liberally applied and the affected area subsequently enclosed in bandages. Until the studies are concluded treatment of "athlete's foot," ringworm and other fungous infections with a mixture of phenol and camphor or any other potent remedies is best intrusted to the qualified physician.

#### BIOTIN DEFICIENCY IN MAN

Investigations of the nutritional requirements of experimental animals influence human problems. A preliminary report just available<sup>1</sup> concerns biotin deficiency in man and its cure with a biotin concentrate. The deficiency was induced by feeding a diet poor in biotin, the lack of this dietary factor was accentuated by including dried egg white in the diet. The "egg white injury" syndrome in rats, now attributable to a biotin deficiency, has been studied for some years. A group of four volunteers subsisted on a diet planned to contain a minimal amount of biotin, supplemented daily with a suitable mixture of other purified vitamins. During the third and fourth weeks of the study all four subjects developed a scaly desquamation without pruritus. The condition cleared spontaneously within seven to ten days. At the seventh week one subject developed a maculosquamous dermatitis of the neck, hands, arms and legs. During the seventh and eighth weeks all showed a pronounced grayish pallor of the skin and mucous membranes which was not accounted for solely on the basis of the blood picture. The latter manifested a definite diminution in hemoglobin content, in the number of erythrocytes and in the volume of packed red cells. There was a striking rise in the serum cholesterol. Despite the daily administration of 6 mg of thiamine hydrochloride to each subject during the entire experiment, symptoms strikingly like those noted in experimental thiamine deficiency were seen after the fifth week. Treatment with daily injections of 75 to 300 micrograms of a biotin concentrate resulted in prompt relief in each subject, 150 micrograms daily was suggested as the minimum effective amount. There was an increase in appetite on the third to fifth days after giving biotin, despite the continuance of the same experimental diet. The striking ashy pallor of the skin and mucous membranes disappeared in four days. The elevated level of serum cholesterol was significantly reduced after one week. The detailed results will be of interest in evaluating problems dealing with manifestations of spontaneous avitaminosis and its relation to biotin deficiency.

#### PALINDROMIC RHEUMATISM

The term "palindromic rheumatism" has been recently applied by Hench and Rosenberg<sup>1</sup> of the Mayo Clinic to a disorder observed by them in 34 persons, they consider the condition sufficiently distinctive to constitute a clinical entity. "Palindromic"—from the Greek—means simply "to recur." The disease described is characterized by oft recurring multiple afebrile attacks of acute arthritis and peri-arthritis, sometimes also para-arthritis with pain, swelling, redness and disability. The attacks appear suddenly, develop rapidly generally last a few hours or days and then disappear completely but recur at irregularly spaced intervals. In the cases observed the two sexes were about equally affected, the ages of the patients at onset varied from 13 to 68. The majority of attacks were monoarticular, the sites of predilection were the fingers wrist, shoulder, knee, toe and elbow. Despite the transitory presence of inflammatory exudate in articular tissues, little or no constitutional reaction was observed. Neither could they detect abnormality in laboratory tests or significant functional, pathologic or roentgenologic residues even after years of the disease and scores of attacks. From two to ten attacks occurred yearly in 9 of their cases twenty to sixty yearly in 17 cases, one hundred to two hundred a year in 3 cases and two hundred and fifty or more a year in 5 cases. The Rochester clinicians attempt to differentiate this disorder from rheumatoid arthritis, gouty arthritis, "angioneural arthrosis" and "allergic rheumatism." Results of treatment to date have been inconclusive. The disease is a nuisance and handicap but, in spite of a total of thousands of attacks, permanent crippling was not demonstrated in any single joint. The preliminary report indicates that the claim for the establishment of "palindromic rheumatism" as a clinical entity is well supported by evidence, though it can be accepted as established only after confirmatory studies have been made by several independent observers.

#### COMPULSORY IMMUNIZATION

The report of a survey of all the jurisdictions under the control of the United States, summarized in *Public Health Reports*, March 6, shows that only nine states and Alaska have any express provisions requiring immunization against diphtheria. North Carolina is the only state that requires general immunization of all children between 6 and 12 months of age and those between 12 months and 5 years not previously immunized. The only children exempted are those whose parents or guardians are "bona fide members of a religious organization whose teachings are contrary to the practices required by the law." New Jersey appears to be the only state in which immunization may be required as a prerequisite to school attendance. North Dakota has a statute which "forbids making any form of vaccination or inoculation a condition precedent for admission to any public or private school or college, or for the exercise of any right."

# MEDICINE AND THE WAR

*In this section of The Journal each week will appear official notices by the Committee on Medical Preparedness of the American Medical Association, announcements by the Surgeon Generals of the Army, Navy and Public Health Service, and other governmental agencies dealing with medicine and the war, and such other information and announcements as will be useful to the medical profession*

## THE SALVAGE OF RUBBER AND METALS

Paul C Cabot deputy chief of the Bureau of Industrial Conservation of the War Production Board Washington, D C, has supplied the following information

There is a critical shortage of many necessary war materials at present in this country. The primary sources of supply are now denied to us as the result of conditions in both the Pacific area and in Europe. It is becoming increasingly necessary to tap all possible secondary sources and to reclaim every ounce of these badly needed materials that we can find.

To this end there has been established through the General Salvage Section of the Bureau of Industrial Conservation, state salvage committees in practically every state in the country. These state committees have in turn established local salvage committees in every local defense council in their territory. Complete organization nationwide, can be expected by May 1.

There is a potentially large source of these critical materials to be reclaimed from hospitals, clinics, health departments, diagnostic laboratories—in fact, from all health and medical institutions of any kind not excluding physicians and dentists. The Bureau of Industrial Conservation, therefore, requests that the Health and Medical Committee of the Office of Defense Health

and Welfare Services make every effort to see that the need for these scarce materials is brought to their attention.

Rubber is now America's number one shortage. Our war machine must roll on rubber, and since the rupture of trade lines to the Far East we must rely in large measure on existing scrap rubber now in this country. There is also an acute shortage of metals ferrous and nonferrous. We do not anticipate that medical institutions can make available much tonnage in scrap iron and steel but large quantities of some of the scarcer metals may be collected from such sources.

All medical institutions and individuals desirous of helping in our 'Salvage for Victory' program should get in touch directly with their state or local salvage committee, which will be able to indicate to them the best method of procedure in the collection and disposition of these materials. Following is a list of these state salvage committees.

It can be expected that the health and medical profession which has already contributed so largely to the welfare of the nation, may by this plan be enabled to broaden the scope of its useful activities and provide a definite added service to the country in this time of need.

### FOREWORD

This bulletin outlines the relationship of each of the various units of the Emergency Medical Service to the Control System of the Citizens' Defense Corps and the Civil Air Raid Warning System. Every movement of a protective service must be orderly and purposeful. It is therefore important that every member of the Emergency Medical Service, whether belonging to an administrative service, a field unit, an ambulance unit, a casualty receiving hospital or an emergency base hospital, understand the coordinated timing of their activities with those of other protective services under the constant direction of the Control Center.

### I AIRCRAFT WARNING SERVICE

The Aircraft Warning Service has been organized by the Combat Command of the United States Army Air Forces for detecting and reporting the presence of enemy airplanes. For the purposes of air defense, the continental United States is divided into large areas, each of which is served by an air force. An air force area is, in turn, divided into air defense regions. The command post of an air defense region is known as an information center.

Each subdivision of an air defense region is served by a central communications point known as a filter center. Filter center areas are subdivided into areas of approximately 36 square miles in each of which is located an observation post manned by civilian observers.

The observation post reports the presence of planes to the filter center, where similar information coming in from other observation posts is assembled and evaluated by trained army officers. The combined picture of the probable height, speed, direction, type and number of enemy planes is relayed to the information center. Here the information from various filter centers is plotted on an operations map, and pursuit planes are ordered to intercept the enemy.

### II AIR RAID WARNING SYSTEM

A civil air raid warning officer at the information center notifies the communities in the path of the invading bombers to prepare for a possible air raid. This message is telephoned from the information center to the district warning centers of the civil air raid warning system and from there to the control centers of the communities in the area (fig 1).

### III CONTROL CENTER

The control center of a community is the headquarters of the commander of the citizens' defense corps and his technical staff. Here is received all information essential for operating the civilian protection services during an emergency (fig 2). The control center receives air raid warnings and transmits them to the proper recipients; it orders the sounding of air raid alarms; it receives reports from wardens concerning damage; and it dispatches operating units of the protection services to bombing incidents.

Large cities are subdivided into a number of districts, in each of which is a district control center. The district control center receives and transmits air raid warnings, receives reports of incidents from wardens, and controls the movement and operation of all protection units within or assigned to the district. To large incidents it sends an incident officer who takes command of all protection forces on the scene (including the medical), orders unnecessary units back to their stations or requests additional assistance from the control center.

Over all the district control centers of a large community or area is a main control center which receives reports from the district control centers (not from wardens) and controls the movement of services between districts.

**A Message Room**—In the control center there are an electric bell and a set of four lights corresponding to the degrees of warning—yellow, blue, red and white. From the message room come the signals; the bell is rung and the appropriate light switched on as each signal is received (fig 3).

**B Control Room**—In the control room is a map of the area served by the control center, on which are recorded the locations of wardens' posts, the boundaries of sectors and precincts, and the stations, depots and headquarters of the various civilian protection services. The chief of the Emergency Medical Service is responsible for the accurate recording on this map of the locations of (1) hospitals, (2) casualty stations and medical supply depots and (3) ambulances and other vehicles in transport centers. He must also know the location of emergency medical field units, the number of squads available in each unit and which hospitals have their own ambulances.

With numbered pins of four different colors, the locations and types of incidents are indicated on the map (high explosive, incendiary, gas, unexploded bombs). Road blockages are also recorded.

**C Control Panel**—On a control panel are recorded the numbers and nature of the incidents, the protection services available and the services dispatched. This enables the controller to have a complete visual record of the number and disposition of his services. Pins of distinctive colors are used to identify types of service. Each pin bears a separate number indicating a service unit. Pins for the emergency medical field units are red and white and those for ambulances are white (fig. 4).

**D Communications System**—Telephone numbers at the control center are known only to persons authorized to call the center. Similarly, outgoing lines to stations

might except that essential industry and transportation will be allowed sufficient lights, and street lights will be kept on but will be properly screened so that they will not be visible from the air.

When the presence of hostile aircraft is detected in an area, a series of "warnings" flows from the informa-

Fig. 1—Aircraft warning service and air raid warning system

of the protective services have unlisted numbers. Alternate or "stand by" methods of communication, such as municipal signal systems, short wave radio, broadcast radio, radio telephone or messengers should be provided for in case the telephone service is interrupted.

**Procedure**—Three persons should be on duty at each control center at all times, and a full shift should be available on call.

All essential information is assembled in the control room to enable the commander and his staff to make the necessary decisions. The objectives are speed and, above all, accuracy. Written messages are used rather than verbal instructions, to reduce the possibility of error.

When the military commander decides that an air defense area is vulnerable to bombardment, he will alert the area even though there appears to be no immediate threat of enemy action. An "alert" may be intermittent or continuous over long periods. An area which has been alerted will be blacked out at

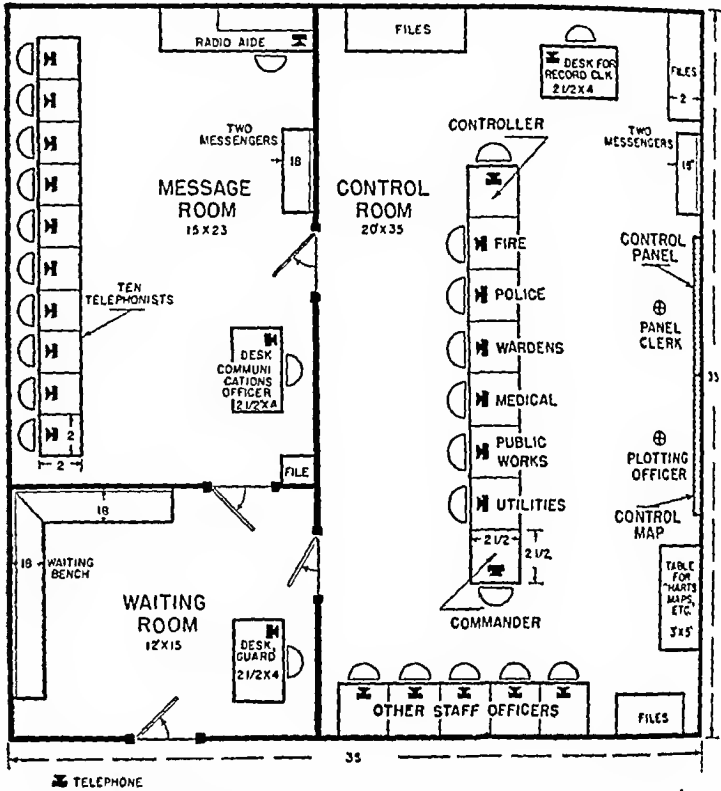

Fig. 2—Typical room layout of control center serving a population of one hundred thousand

tion center through the district warning centers and control centers to the final recipient. In some cases the final recipient may be warned directly from district warning centers rather than control centers.

**1 Yellow Warning—preliminary caution**—The yellow warning is confidential and is not released to the public. It is telephoned to staff members of the control center including the chief of Emergency Medical Ser-

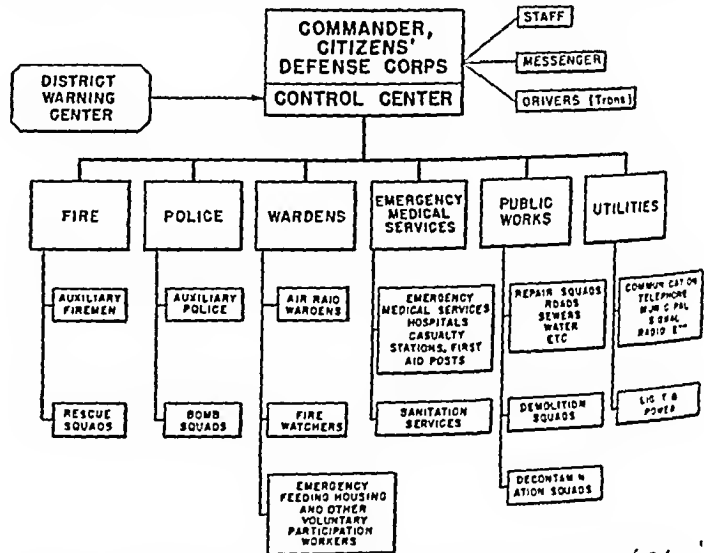

Fig. 3—Relationship between the commander and the various groups. On the yellow warning the chief of the Emergency Medical Service or his deputy reports as medical adjutant to the commander of the control center. On the blue or red warning, hospital or field units prepare for action but do not move to casualty stations or first aid posts until ordered by the control center.

vice and his deputies, to summon them to their stations. The head warden in each zone, who telephones the remaining wardens, to industry and transport, and to police and fire stations. It is not received by medical field units.

2 Blue Warning—*lights warning*—This means that raiders are expected to pass over the area. The warning is telephoned to industry, transportation and hospitals to notify them to obscure their lights. The blue warning is also confidential.

3 Red Warning—*action warning*—When it appears that an air raid is imminent the 'red warning' is given to the general public. It is telephoned to all protection services including hospitals and casualty stations notifying them to be ready for action and the public air raid warning is sounded for a total blackout.

4 White Message—*all clear*—It means that the hostile planes have left the area and that industry and

During a raid, after wardens have reported the location and details of incidents to the control center, fire fighters, rescue squads or other appropriate action units are dispatched to the scene. When casualties are reported the hospital field units and ambulances are ordered to the casualty stations near the incidents.

#### FIELD UNITS OF THE EMERGENCY MEDICAL SERVICE

The organization, equipment and operation of emergency medical field units is described in Medical Division Bulletins Nos 1 and 2. There is great advantage in organizing nonsurgical resident staffs of hospitals—

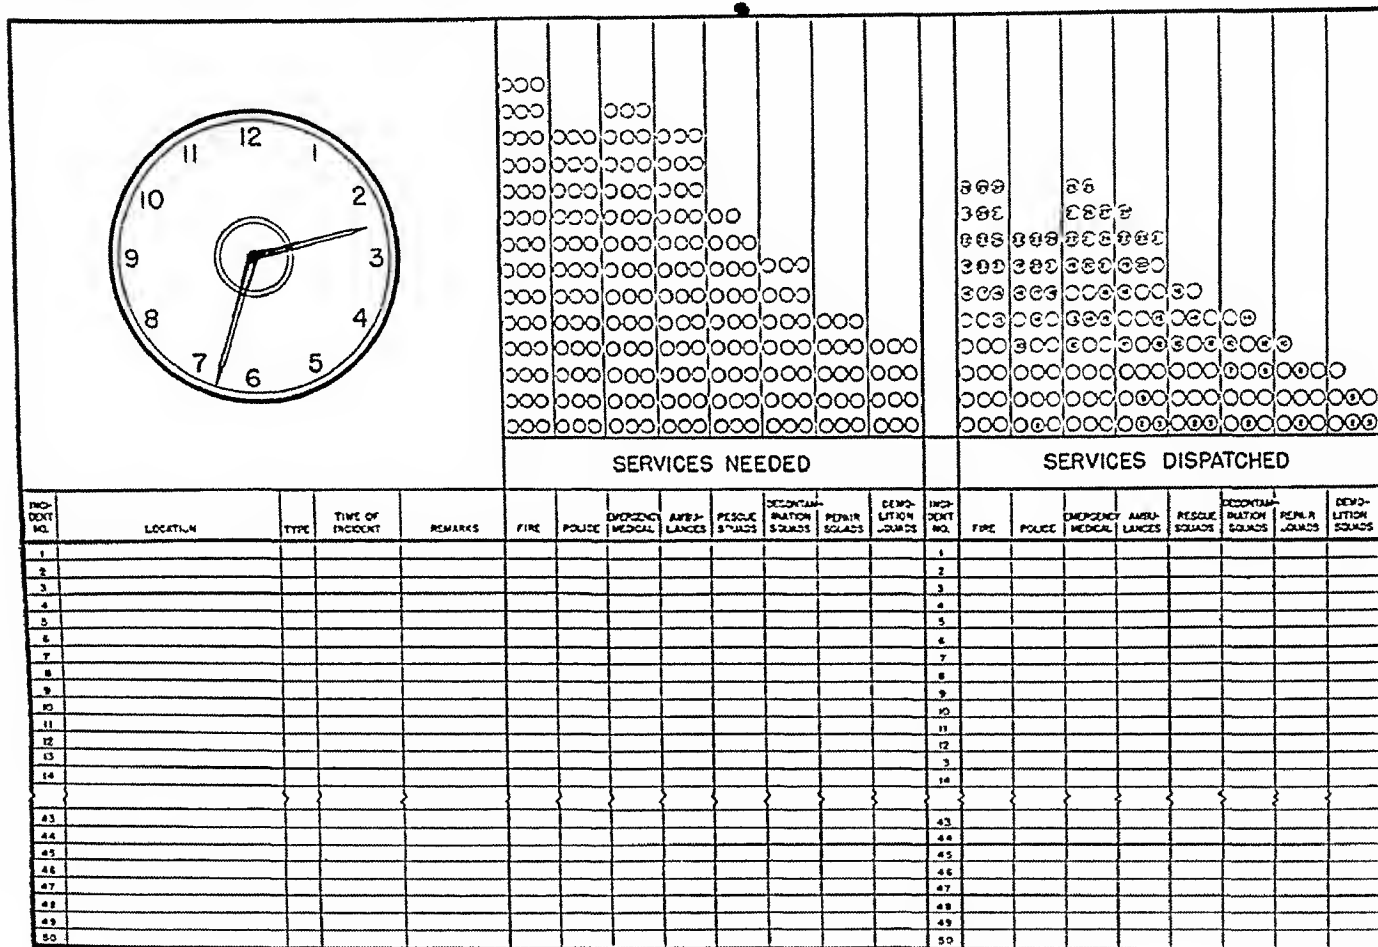

Fig. 4—Control panel

transportation may resume the use of lights allowed them under the provisions for the "alert."

*Warnings to Hospitals and Field Units of the Emergency Medical Service*—Medical units are not as a rule brought into action on the yellow signal. This is a precautionary warning which should not disturb the operation of hospitals and the regular duties of physicians and nurses throughout the community.

The blue warning is the first received by hospitals and casualty stations. It is confidential and not a signal for calling doctors and nurses from all parts of the city to their posts at the casualty stations.

The red warning to hospitals means "Assemble your emergency field units, their equipment and transportation, but do not move until you receive orders."

In communities in which field units have not been organized in hospitals, the red warning means "Summon doctors, nurses and nurses' aides to the casualty stations and have them stand by for orders."

interns and nurses of the medical, pediatric and neurologic services—into emergency medical field units to serve as the first line of the casualty services. Squads of two to four interns and nurses can be on call day and night, but their regular work continues until they are notified that persons have been injured and their services are needed. Their preparedness makes it unnecessary to man all casualty stations on every alert. If, however, prolonged or repeated raiding results in continued demand for medical services at casualty stations, hospital units may be relieved by reserve units of neighborhood physicians and nurses. These units should be related to hospitals and drilled regularly in case it becomes necessary to relieve the hospital units and to staff casualty stations on a more permanent basis.

The hospital should be the center of all casualty services in its area. Its staff is ready for emergency duty at a moment's notice, and there are trained reserves

PROPERTY

available in the event of prolonged or frequent attack. Failure to organize emergency medical field units within hospitals will waste time and effort. Areas alerted will be much larger than those actually attacked, and, in the absence of hospital units available at all times for immediate dispatch, practicing physicians and nurses whose services are sorely needed in their communities must man every casualty station in the alerted area.

In small hospitals which have no resident staffs, consideration should be given to a plan under which one or more physicians are on call each night. The physicians on duty would not be required to remain in the hospital, but they should be ready to take up their posts as soon as the warning is given.

All members of emergency medical field units (physicians, nurses, orderlies) and medical auxiliaries such as stretcher teams will be identified by the caduceus on the civilian defense armband, nurses' aides by the red cross on the civilian defense armband.

#### V CHIEF OF EMERGENCY MEDICAL SERVICE AND DEPUTIES

Certain duties of the local chief of Emergency Medical Service are listed in Medical Division Bulletin No. 2.

A During the period of preparation the chief of Emergency Medical Service is responsible for

##### 1 Organization of the field casualty service

(a) Organize and drill emergency medical field units in hospitals and among physicians and nurses in the community.

(b) Select casualty station sites and arrange for canteen and disaster relief services at casualty stations.

(c) Assemble field equipment in medical supply depots.

(d) Assemble transport facilities.

##### 2 Plans for hospitalization of casualties

(a) Assign hospital beds to each control district.

(b) Arrange for periodic census of vacant beds.

(c) Plan with state chief of Emergency Medical Service for base hospital facilities to which casualties and other sick may be evacuated.

##### 3 Provision for medical direction at the control center

(a) Train and assign deputies to serve as medical adjutants.

(b) Arrange for direct telephone lines between control center and hospitals and casualty stations.

(c) Spot hospitals, casualty stations, medical supply depots and ambulance depots on control center map.

##### 4 Collaboration with the Red Cross

(a) Promote the training and assignment of volunteer nurses' aides.

(b) Extend first aid training, emphasizing priority for personnel of the Citizens' Defense Corps.

(c) Train stretcher teams for assignment to casualty stations.

##### 5 Organization of casualty information and mortuary services

B During the period of operations the chief of Emergency Medical Service or one of his deputies serves as medical adjutant at each control center. The adjutant must be ready to report immediately on receiving the yellow warning. He must have complete knowledge of the number and availability of all service units at his disposal. He must also know the number of vacant hospital beds in the city and the maximum daily operating load each hospital can assume. On report of casualties he will order the dispatch of medical field units under the general supervision of the commander or the controller.

Large cities are usually subdivided into districts, each governed during an air raid by a district control center.

The chief of Emergency Medical Service should assign deputies to serve as medical adjutants in district control centers and to assume responsibility under the district commander for the operation of all units of the Emergency Medical Service in the district. The main control center for an area will receive reports from district centers (not from wardens) and will govern the transfer of services between districts when needed. When medical field units return to their casualty stations or hospitals, they should report immediately to their control center so that they may be used at other incidents. The district medical adjutant will report periodically to the chief of Emergency Medical Service the number of casualties in his district and, when indicated, the need for the allocation of additional hospital beds or emergency medical field units.

The chief of Emergency Medical Service will keep a daily record of new casualties and of deaths due to enemy action and will clear the record through the personnel officer of the control center to the proper municipal departments. For this purpose he must organize a casualty information service and also a mortuary service for identification and custody of the dead.

#### VI CARE OF CASUALTIES IN THE FIELD

An air raid casualties are usually limited in number compared with the amount of structural damage produced by high explosive bombs. Most casualties are, however, severe. In the British experience, 40 or 50 per cent are killed outright or die soon after injury, and most of the remainder require prompt transportation to hospitals for operative procedures and resuscitation therapy. Crushing injuries, fractures, internal hemorrhage, extensive burns and shock require skilful medical judgment and attention at the site of the incident. Abdominal perforation may accompany a small penetrating lesion, head injury may cause a skull fracture or a cerebral or subdural hemorrhage without external wound. Multiple penetrating lesions of the face, eyes and other parts of the body due to fragments of glass are common and require immediate skilled attention.

As the injured are extricated from demolished buildings by rescue squads, stretcher bearers carry them to first aid posts. Medical judgment is required to classify injuries, apply first aid, administer morphine, prevent shock and indicate priority for ambulance transportation to the hospital. Responsibility for the care of an air raid casualties is for trained physicians with their nurse assistants and medical auxiliaries, and not for persons with a twenty-hour course in first aid or for the corner druggist.

*A Casualty Stations and First Aid Posts*—The functions of casualty stations and first aid posts are outlined in Medical Division Bulletin No. 2. The casualty station is at a fixed, predetermined site whereas the location of a first aid post is selected at the time of the incident. The casualty station should have direct telephone communication with its control center. Primarily, the casualty station is the place of assembly for one emergency medical squad consisting of two to four medical teams, each headed by a physician and including a nurse and one or more nurses' aides or orderlies, as described in Medical Division Bulletin No. 1. It is also the place of assembly for stretcher teams who assist the medical team at the first aid post by bringing in the injured.

From the casualty station one or more medical teams may be deployed by the squad leader or on instruction

from the control center to establish temporary first aid posts near the incidents. The site selected for a first aid post should provide shelter, safety and accessibility to ambulances. The responsibility of the first aid post is to administer emergency care and to expedite transport of the severely injured to a hospital. A casualty station may serve as a first aid post if it is near the incident.

In large cities there should be one casualty station for every twenty-five thousand of population. In small cities with less population and relatively larger area it may be necessary to provide stations in double this ratio. The number and location of casualty stations are to be determined by geographic considerations as well as by the population to be served.

A casualty station serves for the reception of the less severely injured (those who can walk) and for those suffering from nervous shock or hysteria. It should have facilities for a canteen and be related to a temporary rest center for uninjured persons whose homes have been destroyed or are unsafe for occupancy. It removes the burden of a vocal but less seriously injured group from hospitals overtaxed with the care of severe casualties. Every hospital should therefore provide casualty station facilities in its outpatient clinic or other suitable place.

After a short period of observation at the casualty station, slightly injured persons may be allowed to return to their homes or to places of temporary shelter provided by the welfare department of the city or by the Red Cross. In order that persons sent home may be assured of adequate care, the chief of Emergency Medical Service should arrange with local public health nursing agencies for follow-up service. The day following an incident a physician or a public health nurse should visit the homes of all persons who have been slightly injured. Persons needing medical care may be referred to a neighborhood physician. In this manner the neighborhood physicians in the vicinity of a casualty station may serve as "incident physicians." Those who require medical care but cannot afford a private physician should be referred to a clinic.

**B. Medical Supply Depots**—The casualty station or some place in its vicinity is also the site of the medical supply depot, where stretchers and blankets are stored for the stretcher teams and collapsible cots, blankets and other equipment for the station itself. Here should also be based the canteen and the reclothing and rehousing services of the municipal welfare department or the Red Cross.

It may be necessary to establish a larger medical supply depot at a police or fire station or other suitable place from which several casualty stations may be equipped. Transportation must then be constantly available at these depots. This is less desirable than the establishment of a medical supply depot at the casualty station itself.

The medical supply depot for each casualty station should include a minimum of twenty stretchers and fifty collapsible cots. At least two blankets should be available for each stretcher and cot. Additional stretchers and blankets must be provided at the hospitals for exchange with the ambulance driver when stretcher patients are received. A surplus is essential because many stretchers and blankets will be occupied by seriously injured persons who cannot be moved. Others

may have been used for the dead and must await cleaning and disinfection.

Cities in the "target areas" may require as many as two stretchers per thousand of population and three times this number of collapsible cots. They should be provided as far as possible out of local resources. This equipment will later be supplemented from federal sources.

Medical Division Bulletin No. 2 lists the medical and surgical equipment of a casualty station (list 2). The individual cases of equipment for emergency medical teams (list 1) are best stored at the hospital from which the field unit is derived, here the morphine supply can be protected and the surgical dressings replenished and resterilized. If the field unit is not related to a hospital the individual cases of equipment for a team may remain in possession of the physician members of the team or stored in the casualty station, except for the morphine supply which must be safeguarded in accordance with the instructions of the federal commissioner of narcotics as outlined in Medical Division Memoranda dated Dec. 15, 1941 and Jan. 19, 1942.

The medical supply depot should also be provided with simple heating equipment and cooking utensils and a generous supply of hot water bottles or chemical heating pads.

**C. Medical Auxiliaries—Stretcher Teams**—Trained stretcher teams are part of the Emergency Medical Service. They serve under the physician in charge at the casualty station or first aid post and are responsible for transporting the severely injured to the first aid post or to the casualty station if it is serving as a first aid post. Each casualty station will require at least four to six stretcher teams or a total of twenty trained stretcher bearers, half should be on call during the day and half at night.

Team members should be derived from the immediate neighborhood of the casualty station or hospital to which the team is attached. It will usually be necessary to organize separate day and night teams. If there are numerous casualties, stretcher team members can commandeer volunteers to assist in stretcher carrying. The regular stretcher team member serves as leader of this impromptu type of team and is responsible for proper handling of casualties.

A leader and assistant leader should be appointed for each team and a group leader for each group of teams based on a single casualty station or hospital. The group leader and at least one team leader should be selected, whenever possible, from the employees of the building used as a casualty station or from the personnel of the hospital. No member of a hospital staff who has any maintenance function should be selected for this position.

On the public alarm the group leader and at least one team leader (or assistant group leader) will report to the casualty station and remain near the telephone connected with the control center.

On order of the control center the group leader will activate teams as directed and will dispatch them to such points as may be designated by the control center. Teams should be so organized that they can be activated rapidly without recourse to public communication facilities. Activation must also be selective, so that only the teams needed are dispatched.

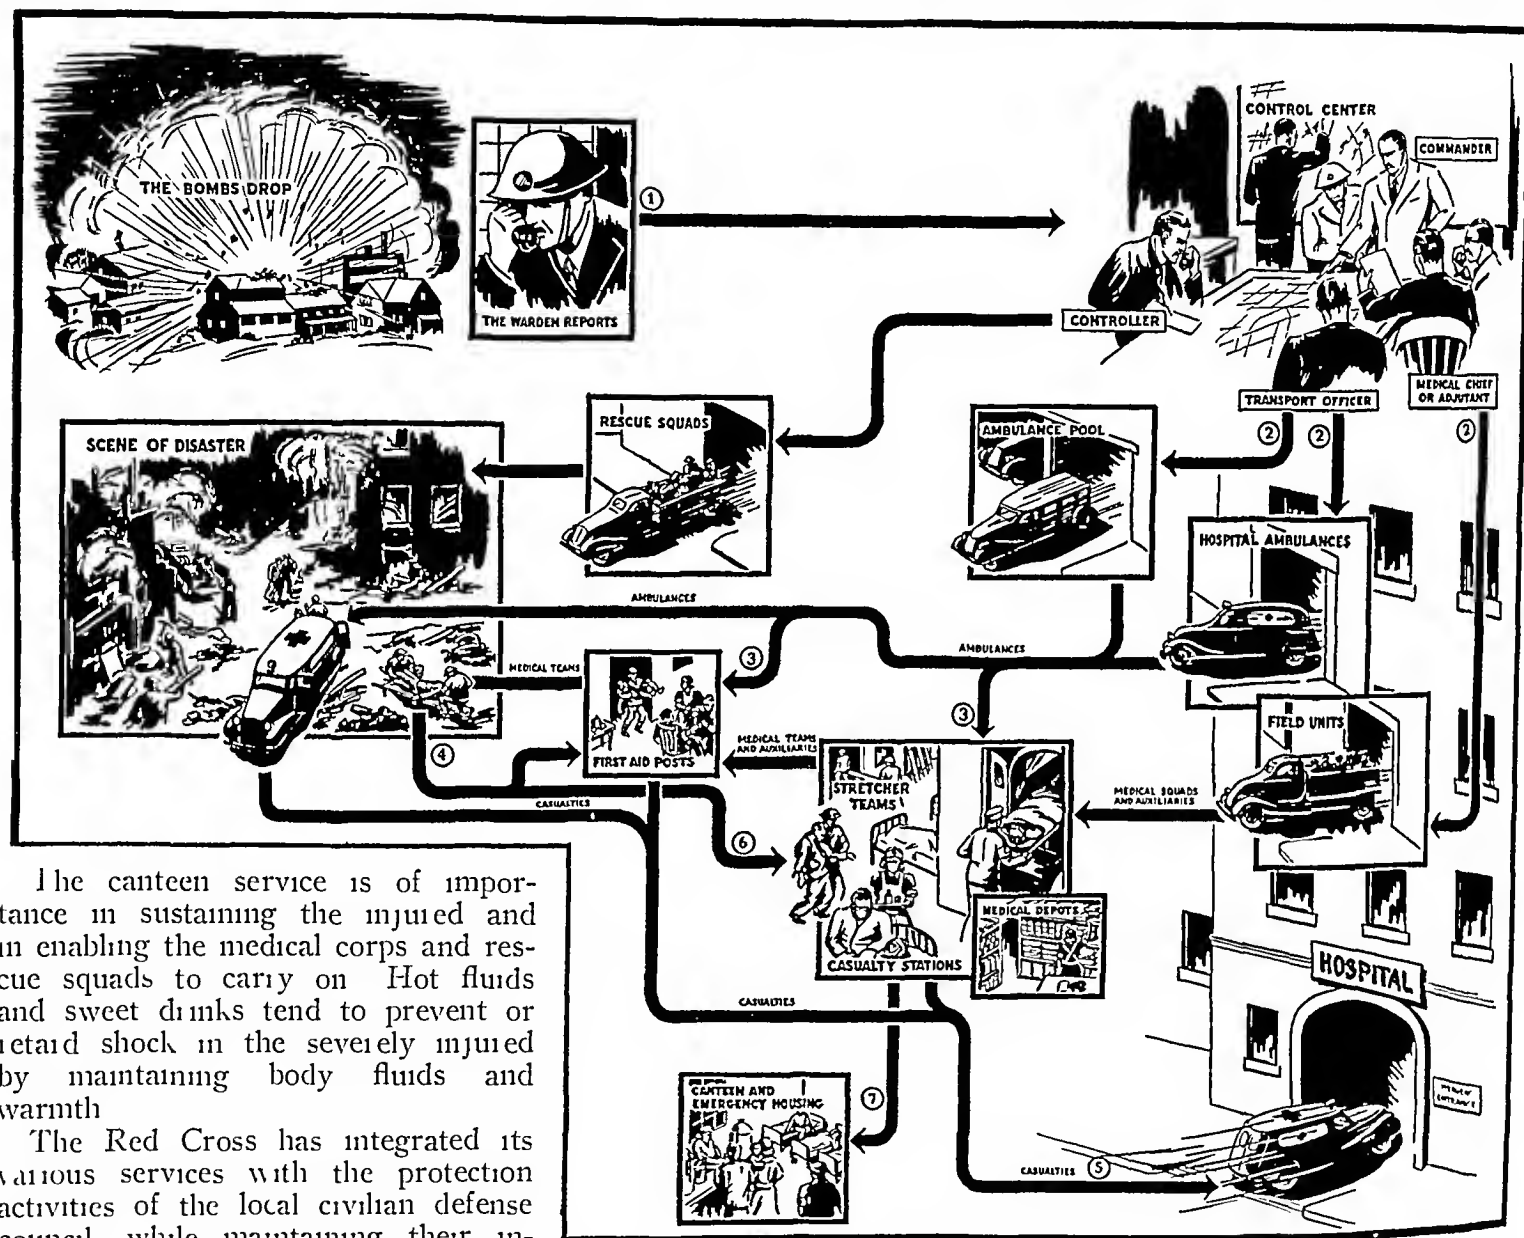

Technical training for stretcher bearers will consist of the standard first aid course of the Red Cross followed by supplemental training and drilling in extri-

cating injured persons from difficult positions, in loading and carrying a stretcher, and in loading and unloading ambulances

**D American Red Cross Units**—In almost all communities the local Red Cross chapter is prepared to provide a variety of essential disaster relief services, such as canteen, reclothing, rehousing, auxiliary ambulance and passenger transportation. In many communities Red Cross chapters are also prepared to assist the chief of Emergency Medical Service in equipping casualty stations and medical supply depots and providing some of the personnel

Office of Civilian Defense only if given by qualified Red Cross or Bureau of Mines instructors in accordance with the Red Cross or Bureau of Mines standards approved by the Office of Civilian Defense. The Red Cross will assist in the training and organization of stretcher teams for assignment by the chief of Emergency Medical Service to casualty stations. The Red Cross also has assumed complete responsibility for training volunteer nurses' aides in collaboration with hospitals designated as training centers.

The chief of Emergency Medical Service is in charge of the operation of all units of the Emergency Medical

The canteen service is of importance in sustaining the injured and in enabling the medical corps and rescue squads to carry on. Hot fluids and sweet drinks tend to prevent or retard shock in the severely injured by maintaining body fluids and warmth.

The Red Cross has integrated its various services with the protection activities of the local civilian defense council, while maintaining their integrity as Red Cross service units. In emergencies arising out of enemy action the Red Cross will place its units and equipment under the direction of the commander of the citizens' defense corps.

Local welfare, feeding, housing and other relief services are primarily the responsibility of local government, and a unit to serve these functions is part of the citizens' defense corps. These government services will be supplemented by the Red Cross to the limit of its disaster relief resources. The evacuation of city populations to rural areas will be the responsibility of the state and federal evacuation authorities, under whom the Red Cross will operate. First aid training is the responsibility of the Red Cross, and when sponsored by other agencies it will be recognized officially by the

Fig 5—Operation of the Emergency Medical Service. 1 The warden reports on casualties at the incident. 2 The control center orders the medical field unit of the hospital to the casualty station nearest the incident. 3 The casualty station, if close to the incident, serves as first aid post; otherwise medical teams headed by doctors are sent for to set up advanced first aid posts to which ambulances can approach. 4 Stretcher teams carry the injured to the first aid post, from which they are transported to (5) the casualty receiving hospital as soon as possible. The slightly injured go to (6) the casualty station for temporary care until they can return home or go to temporary shelters. At or near the casualty station are (7) a medical supply depot and a canteen service station. 8 From the casualty receiving hospital the injured can later be evacuated to an emergency hospital in a safe rural area.

Service under the direction of the commander of the citizens' defense corps. In some communities the local Red Cross chapter has equipped casualty stations with medical supply depots. Under the conditions of actual air raid all organizations must work directly under central control. Otherwise the commander cannot have a complete and consistent picture of the situation. He will not be able to direct help to the place where it is most urgently needed, nor will he be

when to summon outside assistance or whether he can safely send services to other areas

*E Local Ambulance and Other Transport Services*—Ambulances and other vehicles for transporting casualties from an incident to hospitals will be obtained from three sources (1) casualty receiving hospitals, (2) private ambulance companies and undertakers and (3) central ambulance depots where auxiliary trucks, converted station wagons and taxicabs are available. It is necessary to provide a central ambulance depot in each control district so that the district commander may know the number and the location of all vehicles at his disposal. The pool may be composed of ambulances belonging to the American Red Cross and the various voluntary agencies, commercial vehicles equipped with special racks for carrying stretchers, and passenger vehicles for sitting patients.

Ambulances or passenger vehicles carrying squads of emergency medical field units and their equipment from hospitals to casualty stations will transport casualties from the incident or the first aid posts to the hospital. Other vehicles remain at their assigned central depots until instructed to move by central control. Vehicles on discharging their load at hospitals continue to move only in accordance with orders from central control. If there are no orders, they return to their depots and await further instructions.

All requests for ambulance service must pass through the district control center, which should report at once any shortage of transport to the main control center. Under conditions of raiding and blackout, shortage of transport may be due to faults in distribution rather than lack of vehicles. It is essential, therefore, that the commander have an exact knowledge of the disposition of his transport at any moment. This is not possible if ambulances move in response to local calls without reference to the control center.

Ambulance drivers should return to their depots as soon as they have carried out an order. Under blackout conditions a whole fleet of vehicles can easily be lost for hours if they do not follow instructions. They must make trips to specified points and return as soon as they have carried out instructions. Ambulance drivers must not stop on their return journey from hospitals to collect wounded from the streets, by so doing they will interfere with other ambulances and slow up the whole process of collecting the wounded.

A number of vehicles needed for a given population will vary according to geographic considerations. A minimum of one four stretcher ambulance or two two stretcher vehicles is desirable for every ten thousand of population. Specially built ambulances are not necessary, commercial trucks with or without special stretcher racks may be used. A surplus of ambulance vehicles and drivers must be registered, because they will not always be available. If hospitals are some distance from probable sites of enemy attack a greater number of ambulances must be provided because of the long transport haul.

At hospitals and in central depots, passenger vehicles also should be available. Experience indicates the need of providing for as many sitting patients as stretcher patients.

*F Regional or State Ambulance Service*—Ambulances accommodating four or six stretchers, and trucks or converted busses capable of holding a larger number, should be available in the exposed seaboard areas. This service, which is distinct from the field ambulance service, should be controlled by regional or state medical

officers. It is for the evacuation of patients from casualty hospitals to emergency base hospitals in protected rural sites. Ambulance trains should also be obtainable through the military authorities in exposed areas.

#### VII CASUALTY RECEIVING HOSPITALS

All general hospitals in a community, voluntary as well as governmental, are included in the Emergency Medical Service. Each hospital should be specifically related to the control center and to certain casualty stations in the district in which it lies or to which its beds have been assigned.

The chief of Emergency Medical Service may delegate to a member of the hospital staff the responsibility as field leader, for supervising the medical and surgical equipment of the hospitals' related casualty stations and the training of their field units, whether derived from hospitals or composed of physicians of the community. This will relate all field units advantageously to hospitals, so that the clinical experience of the hospital may serve as a guide to the emergency measures employed by the field units.

All hospitals in the community should submit a daily census of vacant beds to the chief of Emergency Medical Service for transmittal to the medical adjutants at the district control centers. Hospitals must be prepared to expand their bed capacity in an emergency (1) by discharging convalescent patients to their homes, (2) by transfer of patients to other institutions and (3) by setting up additional beds in dining rooms, classrooms and other places. Additional stores of beds, mattresses and linens should be available.

To insure continuation of adequate nursing care for convalescent patients evacuated from hospitals, organizations employing public health nurses may be asked to provide for home visits. Directions for medical care to be given at home should, if possible, come from patients' private physicians. Welfare and social service organizations in the community may be called on to assist with arrangements for transfer of patients to other institutions or to their homes.

The number of casualties sent to a hospital will depend on the operating room load it is capable of handling, as well as on the number of vacant beds. Because of the severity of air raid injuries, an operating team will average less than one operation an hour. Where possible, two tables should be provided for each operating room so as to conserve the services of anesthetists, transfusion teams, nurses and orderlies, as well as equipment. The operating rooms and surgical staff of a fairly large hospital may be expected to care for only fifty major air raid casualties in twenty-four hours.

Casualty receiving hospitals must keep the control center constantly informed during an air raid of their ability to accept admissions. A hospital should notify the control center before its maximum capacity is reached, so that casualties may be diverted to another hospital. If the maximum capacity of all hospitals in a district is approached, the district control center will call on the main control center for allocation of additional beds from other districts.

When there are large numbers of burn cases, it is advisable to divide them among several hospitals. Burn cases constitute a heavy burden on the medical and nursing staff and require much care. For this reason it is advisable also to distribute burn cases among several wards of a hospital.

Medical Division Bulletin No. 3, "Protection of Hospitals" includes a description of facilities for unloading

of ambulances at the hospital during a blackout. As stretchers are unloaded, an equal number of clean stretchers and blankets must be available for exchange.

Adequate facilities and efficient administration will save lives in the receiving ward as well as in the operating room. The reception officer should be an experienced surgeon who can classify patients according to the nature of the injuries and determine need for prompt transfer to operating or resuscitation rooms. The reception room should be large. Patients should be arranged so that all can be watched by the reception officer and nurse for signs of shock or hemorrhage.

On the first manifestations of shock the injured should be transferred to an adjacent resuscitation room where plasma and whole blood are available and a trained transfusion team is in attendance. Shock and hemorrhage should be combated before as well as during and after operative intervention. If dried or frozen plasma is employed, the transfusion teams must be familiar with the technique of preparing the plasma for injection.

#### VIII. EMERGENCY BASE HOSPITALS

Cities likely to be exposed to enemy action require the assistance of a state chief of Emergency Medical Service to interrelate their medical protective activities with those of adjacent localities. Under his direction a state hospital officer is required in the seaboard states to maintain an inventory of hospitals, mental institutions, convalescent homes and other medical facilities in rural areas. These facilities will serve as emergency base hospitals to which civilian casualties and certain categories of the hospital population may be evacuated from exposed cities. Direct bomb hits, the effect of blast or the proximity of an unexploded bomb may necessitate the complete evacuation of a hospital. Partial evacuation may be required to remove patients from exposed locations such as upper floors or to free beds for new casualties.

*A Hospital Officer*—In planning for the most efficient use of existing hospital facilities the state hospital officer should work in close collaboration with the state evacuation authority. This is essential if emergency base hospitals and other medical and transport facilities in reception areas are to be utilized also for evacuated civilians. These recommendations are intended only for seaboard states with densely populated centers located in exposed areas which might be military objectives.

The functions of the state hospital officer are:

1 To survey hospitals throughout the state (excluding those in exposed cities) and determine how many beds can be put into immediate use with existing kitchen, laundry, sanitation and other engineering facilities by:

- (a) Clearing patients to their homes
- (b) Restricting admissions
- (c) Using rooms not normally used for patients
- (d) Rehousing medical nursing and other personnel outside the hospital
- (e) Using neighboring buildings (schools, hotels, and the like) for patients
- (f) Extra bed accommodation in temporary structures erected on grounds near the hospital

2 To assist in designating for each casualty hospital or group of hospitals in each exposed city (a) the line of evacuation to the base (b) the transport arrangements and (c) the emergency base hospitals provisionally allotted to each local casualty hospital or group of hospitals.

3 To keep constantly informed of the bed state of every hospital in his area by weekly reports:

4 To advise the Office of Civilian Defense through the regional medical officer on the need for providing additional accommodations.

5 To report to the regional medical officer of the Office of Civilian Defense any exceptional conditions requiring action (e.g. beyond state boundaries or required by the military situation) and to forward to him a monthly report on the state emergency hospital program. Where a hospital outside a state boundary is accessible for casualties from an exposed city in his area he should record this fact and include in his report any arrangements made for cooperation.

6 To maintain constant touch with the other service departments of the state defense council (e.g., evacuation).

7 To supervise the distribution of medical equipment furnished by the Office of Civilian Defense and report any threatened deficiency to the regional medical officer.

8 To supervise staff arrangements for emergency base hospitals and reception areas.

9 To control movements of medical and nursing staffs as well as of casualties in any situation affecting emergency base hospitals.

*B Mental Hospital Inventory*—Preparation for making a mental disease hospital available for casualties (emergency base hospital) requires the collaboration of the state officer in charge of mental institutions. It should include the following specialized inventory of the patient population:

1 Patients confined to bed and requiring hospital treatment (a) under restraint or isolation or (b) in a general ward and requiring only custodial care.

2 Ambulatory patients (a) requiring constant or occasional restraint (b) requiring expert supervision (but not restraint) in a mental hospital, (c) fit for discharge to a home or institution and requiring only custodial care, (d) fit for discharge to their own homes under occasional supervision or (e) able to work under supervision in the state institution.

3 Total number of patients—male, female, children (a) total for discharge, (b) total for work in a hospital (c) total for transfer to custodial institutions, (d) total requiring transfer to other institutions.

#### IX. CASUALTY INFORMATION SERVICE

In order that information may be promptly available to relatives and friends for early identification a casualty information service should be established in exposed communities by some responsible agency such as the health department or a joint hospital council. In an emergency it should be possible to expand the personnel with librarians and other trained persons accustomed to filing information and dealing with the public. The casualty information service will obtain the information from the chief of Emergency Medical Service and will verify its accuracy by direct communication with hospitals, police, medical examiners and morgues. It should serve under the general direction of the chief of Emergency Medical Service but should relieve him of the burden of operating the service.

The physician in charge of the medical squads or teams at an incident must keep the medical adjutant at the control center constantly informed of his casualties list and of the hospitals to which the injured have been evacuated. Casualty stations will render similar reports. During an air raid each casualty receiving hospital will report every two hours the list of casualties received.

The medical adjutants will render a daily report to the chief of Emergency Medical Service which will include the names and disposition of all injured persons. He will transmit this information to the casualty information service. He will also submit a report of the dead and their disposition which will be transmitted to the appropriate agencies.

#### MORTUARY SERVICE

A mortuary service should be established by the police department, the medical examiner or coroner and the department of health in collaboration with the morticians. They should jointly organize the mortuary service as one of the essential protection services and should train squads of nontechnical men and women for the collection, cleansing, laying out and disposition of the dead. Undertaking establishments may be helpful in supplementing morgue facilities and providing transportation of the dead. Those who are killed in

an incident should not be brought to a casualty station or first aid post. A separate room or yard should be provided at casualty stations for those who may die before transfer to a hospital. They can later be removed to morgues with the least disturbance of the population.

Provision must be made for identification of the dead, and for this purpose the police medical examiner or other government agency must be equipped for fingerprinting and photography. At the morgue or other temporary resting place, opportunity should be provided for viewing and identification of bodies by relatives and friends.

#### COLONEL FINNEY TO HEAD JOHNS HOPKINS UNIT

The War Department has activated the 118th general hospital unit which is one section of the Johns Hopkins University Hospital Unit and will be under the command of Col. George Finney, the son of Col. J. M. T. Finney, who headed the same numbered unit from Johns Hopkins when it went to France during the first world war. The 118th general hospital unit will train at Camp Edwards, Mass.

The other section of the Johns Hopkins unit, the eighteenth General Hospital, has been activated and will train at Fort Jackson, S. C.

The 42d and 142d General Hospital units from the University of Maryland Hospital also have been activated and will train at Fort Custer, Mich., and Fort Riley, Kan., respectively. According to the *Army and Navy Journal*, the unit director is Lieut. Col. Maurice C. Pincoff.

#### SUMMER UNIFORM FOR ARMY OFFICERS

A lightweight khaki single-breasted semi-form fitting sack coat without belt of the same design as the officers' white dress coat has been authorized for optional wear by army officers with the khaki summer uniform. The War Department has announced. The new coat may be made from 8.2 ounce cotton twill, 7-8 ounce rayon, tropical worsted or cotton warp mohair filling. When the new coat is worn, uniform trousers must be of the same material. Officers will not be required to purchase or wear the new coat. The summer uniform for duty consists of shirt and trousers in khaki color. At the option of the officer, this coat may be worn on appropriate occasions. In the District of Columbia, the summer uniform is to be worn from May 15 to October 1. Elsewhere, dates are designated to suit local climatic conditions.

#### INTENSIFY DRIVE FOR MORE NURSES FOR WAR DUTY

The national director of the Red Cross Nursing Service, Miss Mary Beard, stated on April 18 that the problem of supplying nurses to meet the constantly increasing demands of the Army and Navy is still a serious one, although seven thousand registered nurses from every section of the country have volunteered since Pearl Harbor for war duty through the Red Cross. This figure represents an all-time peak in enrollments and is 50 per cent above the same month a year ago and more than were registered during the entire year of 1940. Nevertheless, a thousand additional trained nurses must be recruited each month this year.

Miss Beard also announced the creation of a student nurse reserve and the assignment of representatives of each of the nine army corps areas to stimulate enrollments further. Senior students in qualified schools of nursing will be given an opportunity to sign up with the Red Cross through the new student nurse reserve, and on completion of their final year and state registration they automatically become members of the reserve and eligible for assignment to the Army and Navy. Representatives in each senior class are being appointed to assist local Red Cross nursing committees to build up the new reserve. The special representatives on enrollment in the nine army

corps areas will begin immediately and will assist army nurse corps captains in enrollment routines and in checking the qualifications of nurses volunteering for service with the armed forces.

The formation of many army-affiliated medical units requiring from fifty to one hundred and twenty nurses each has increased further the need for nurses, and only Red Cross first reserve nurses are eligible for assignment to these hospital units, which will serve in camps here and abroad. The age limit for nurses in these units has been raised to 45 years, but for other army commissions, nurses must be between the ages of 21 and 40.

#### ONE THOUSAND SHELTERS FOR NEW YORK CITY

One thousand rest centers or shelters are already available in New York City, it was announced April 1, where residents who have been bombed out of their homes can be fed and sheltered. Robert C. Davis, executive director of the New York chapter of the American Red Cross, said that a plan had been worked out in cooperation with the municipal officials to make rest centers available in every precinct in New York City. The Red Cross has assumed the responsibility of establishing, equipping and operating them for the temporary care of noninjured persons.

#### THE CHICAGO LOYOLA UNIT

U. S. Army General Hospital No. 108 is being organized at Loyola University School of Medicine, Chicago, and will be ready for preliminary training in a short time. The applicants for the fifty-seven medical positions in the unit must be graduates of Loyola, according to Dr. George T. Jordan, Chicago director of the unit. The one hundred and twenty nurses will be from Mercy Hospital, St. Bernard's Hospital, St. Elizabeth's Hospital and Columbus Hospital in Chicago, St. Francis Hospital in Evanston and St. Anne's Hospital in Oak Park.

#### INSTRUCTION TO WATERWORKS OFFICIALS

An emergency water and sewerage committee has been created by the Indiana State Defense Council in cooperation with the state board of health. The secretary of the committee is B. A. Poole, chief sanitary engineer of the state board of health. According to Dr. J. W. Ferree, state commissioner of health, the committee has issued instructions to all waterworks officials concerning the protection of plants against sabotage.

#### SECOND HARVARD UNIT ACTIVATED

The 105th General Hospital unit from Harvard University has been activated and ordered to a far western station for training. The 5th General Hospital unit from Harvard University had been activated previously.

#### BLOOD BANK ON UNIVERSITY CAMPUS

A blood plasma bank is being set up in Cowell Memorial Hospital on the Berkeley campus of the University of California for civilian use in time of disaster.

# ORGANIZATION SECTION

## OFFICIAL NOTES

### ARMY EXHIBIT AT ATLANTIC CITY

A feature of the annual session of the American Medical Association in Atlantic City, June 8-12, will be an exhibit of the work of the Medical Department of the Army. This will occupy spaces 1-2-9U, 1-10-11V and 1-2W in the Technical Exhibit. The illustrations shown herewith indicate a portion of the exhibit. The purpose of the exhibit presented by the Medical Department Equipment Laboratory, Carlisle Barracks,

Outside view of operating room, mobile unit, Sixth Surgical Hospital

Pa., is to acquaint the medical profession at large with the various types of combat and field equipment employed in the Medical Department of the United States Army. The exhibit includes such equipment as the folding leg splint, steel litter, battalion medical equipment pack carrier, new type helmets and head gear, portable disinfectors, gas proof litter covers, aerial

delivery units, battalion medical carts, cross country ambulance, wheeled litter carriers, flight service chest, gas casualty chest, ambulance and mobile units of surgical hospitals.

Interior view of operating room, mobile unit, Sixth Surgical Hospital

## MEDICAL LEGISLATION

### MEDICAL BILLS IN CONGRESS

*Change in Status*—H R 4476 has been reported to the Senate, providing for sundry matters affecting the military establishment. Among other things, the reported bill authorizes the Secretary of War, out of any moneys available for the War Department, to provide for the employment of interns who are graduates of or have successfully completed at least four years' professional training in reputable schools of medicine or osteopathy in the medical department, at not to exceed \$720 per annum.

*Bills Introduced*—S 2454, introduced by Senator Walsh, Massachusetts, and H R 6929, introduced by Representative Vinson, Georgia, propose to prescribe the relative rank of members of the Navy Nurse Corps in relation to commissioned officers of the Navy. S 2456, introduced by Senator Walsh, Massachusetts, and H R 6931, introduced by Representative Vinson, Georgia, propose to amend an act entitled "An Act to provide for the award of medals of honor, distinguished service medals and Navy crosses, and for other purposes." The bill, among other things, authorizes the President to present, in the name of Congress, a medal of honor to any person who while in the naval service of the United States shall, in the line of his profession, distinguish himself conspicuously by gallantry and intrepidity at the risk of his life above and beyond the call of duty. S 2468, introduced by Senator George, Georgia, proposes to amend the Soldiers' and Sailors' Civil Relief Act of 1940 so as to extend its provisions to an obligation originating on or after Oct 17, 1940, and prior to the time of induction in the service, such obligation being secured by a mortgage, trust

deed or other security in the nature of a mortgage on real or personal property owned by such person at the commencement of his period of military service and still so owned by him. S 2484, introduced by Senator Lee, Oklahoma, proposes to direct the Secretary of War to take such action as may be necessary, and as may be possible in view of the number of registered pharmacists serving in or whose services are available to the Army, to assure that a registered pharmacist is placed in charge of each Army dispensary or similar establishment from which drugs are dispensed. H R 6917, introduced by Representative Beiter, New York, proposes to extend the benefits of the United States Employees' Compensation Act to certain persons and to the widows, children and dependents of certain persons injured while performing duty as firemen on property under the exclusive jurisdiction of the United States. H R 6980, introduced by Representative Hendricks, Florida, proposes to authorize an appropriation of \$1,750,000 to construct a five hundred bed capacity veterans' general medical surgical hospital and domiciliary facility at Saint Cloud, Fla. H R 6922, introduced by Representative Rankin, Mississippi, proposes to amend the existing veterans' regulation regarding hospitalization to bring within its provisions any officer, enlisted man, member of the Army Nurse Corps (female) or Navy Nurse Corps (female) employed in the active military or naval service of the United States on or after Dec 7, 1941, and before the termination of the present war. H R 6996, introduced by Representative Anderson, California, provides for the transfer to certain states of Farm Security Administration facilities and equipment which are used to provide shelter, medical care and sanitary facilities for migrant farm labor families.

## Medical News

(PHYSICIANS WILL CONFER A FAVOR BY SENDING FOR THIS DEPARTMENT ITEMS OF NEWS OF MORE OR LESS GENERAL INTEREST SUCH AS RELATIVE TO SOCIETY ACTIVITIES NEW HOSPITALS EDUCATION AND PUBLIC HEALTH)

### ARIZONA

**Public Health Meeting**—The Arizona Public Health Association held its annual meeting on March 13-14 in Tucson under the presidency of Robert A. Greene, Ph.D., Tucson. Among the speakers were Dr. Jerome E. Andes, Tucson on 'Chemical Substances Occasionally Introduced into Food by Accident', Dr. George O. Hartman, Tucson, 'Bacterial Enteric Infections and Intoxications', and Dr. Sydney E. Sinclair, San Francisco 'A Pediatrician's Thoughts on Mental Hygiene'.

### ARKANSAS

**Dr. Wassell Cited for Bravery**—Dr. Corvidon M. Wassell, Little Rock, who was commissioned a lieutenant commander in the U. S. Naval Reserve and assigned to caring for wounded officers and men of the cruisers *Houston* and *Marblehead* was commended by President Roosevelt in his radio address on April 28 for heroism in Java and has been awarded the navy cross. The following is quoted from the President's address as printed in the *Chicago Tribune*:

When the Japanese advanced across the island, it was decided to evacuate as many as possible of the wounded to Australia. But about 12 of the men were so badly wounded that they could not be moved. Dr. Wassell remained with these men knowing that he would be captured by the enemy. But he decided to make a desperate attempt to get the men out of Java. He asked each of them if he wished to take the chance and every one agreed.

He first had to get the 12 men to the sea coast—50 miles away. To do this he had to improvise stretchers for the hazardous journey. The men were suffering severely but Dr. Wassell kept them alive by his skill and inspired them by his own courage.

As the official report said, Dr. Wassell was almost like a Christlike shepherd devoted to his flock.

On the sea coast he embarked the men on a little Dutch ship. They were bombed and machine gunned by waves of Japanese planes. Dr. Wassell took virtual command of the ship and by great skill avoided destruction, hiding in small bays and inlets.

A few days later Dr. Wassell and his little flock of wounded men reached Australia safely.

Dr. Wassell, who is 59 years of age, graduated at the University of Arkansas School of Medicine, Little Rock, in 1909. It is reported that at various times he has served as a medical missionary in China.

### CALIFORNIA

**Personal**—Dr. James F. Rinehart, San Francisco, has been appointed a member of the state board of health to succeed Dr. Amos Christie, San Francisco, who went to Washington to become assistant director of medical and health service of the American Red Cross. Dr. Rinehart is associate professor of pathology at the University of California Medical School, Berkeley.—Dr. Dwight M. Bissell, Salinas, has resigned as health officer of Monterey County to go to San Jose.

**State Tuberculosis Meeting**—The California Tuberculosis Association held its annual session at the Ambassador Hotel, Los Angeles, April 9-11. The meeting opened with a forum on the organization and operation of a tuberculosis program. Out of state speakers included Mr. Daniel C. McCarthy, New York, on 'Public Relations, Publicity and the Promotion of a Local Tuberculosis Association', Dr. James Burns, Amberson, Jr., New York, 'What to Do with Tuberculosis Discovered by Case Finding', and 'Features of the Early Pulmonary Infiltration', and Dr. Henry C. Sweeney, Chicago, 'Applications of Our Knowledge of Pathogenesis of Tuberculosis to Case Finding'.

### DISTRICT OF COLUMBIA

**Biochemist Receives Milk Award**—George E. Holm, Ph.D., since 1920 biochemist, bureau of dairy industry, U. S. Department of Agriculture, Washington, has been awarded the Borden Company prize of \$1,000 in recognition of his contributions to the understanding of the basic causes and the control of oxidative deterioration of fats and oils and to the prevention of spoilage of dairy products caused by the oxidation of milk fat. The prize is awarded through the American Chemical Society for "outstanding research in the chemistry of milk." Dr. Holm received his Ph.D. in 1919 at the University of Minnesota, Minneapolis.

**Group Hospitalization and Doctors Hospital in Controversy**—Newspapers reported on April 25 that Doctors Hospital has given notice that after March 31, 1943, it will not renew its contract to care for patients enrolled under Group Hospitalization and also that the hospital was refusing care to any new persons signing up for group hospitalization or those whose individual contracts with Group Hospitalization, Inc., expired and have to be renewed in the meantime. The latter was said to have announced that it would take action to require the hospital to care for patients with new or renewed contracts, "even though this may require an appeal to the courts," according to the *Washington Star*. It was stated that there was no disagreement over the issue of termination of the contract between the two corporations as official notice had been served that the hospital would terminate its contract next March. It was agreed that the controversial issue was involved in the difference of opinion over whether the hospital should accept for admission G. H. I. subscribers whose contracts are written or renewed subsequent to March 31, 1942. During the negotiations over whether the contract between the two corporations should be renewed, the hospital officials said they had agreed to continue provided G. H. I. would pay the per diem tax cost of G. H. I. patients. This amounted to about sixty-five cents a day, and G. H. I. refused to pay it. It was stated that Group Hospitalization is one of the nonprofit organizations formed to make available hospital facilities when needed at reasonable costs on a prepayment basis that can be met by low income groups of employees and their families.

### ILLINOIS

**Postgraduate Conference**—The Sixth Councilor District of the state medical society sponsored a postgraduate conference at the Lincoln-Douglas Hotel in Quincy, April 23. The following program was presented:

Dr. Walter R. Fischer, Chicago, Painful Feet  
Dr. Henry George Poncher, Chicago, Blood Dyscrasias  
Frank T. Maher, Ph.D., Chicago, The Chemistry of the New Sulfonamides  
Dr. Arkell M. Vaughn, Chicago, Treatment of Shock  
Dr. Charles H. Phifer, Chicago, War Medicine  
Dr. Harold M. Camp, Monmouth, What May the Medical Man Expect Regarding Military Service?

**Medical Aid Plan Expanded**—The Illinois Division of Public Assistance, with the help of the state medical advisory committee appointed by the Illinois State Medical Society, has completed plans for a new medical care program for recipients of aid to dependent children and old age assistance, effective April 15. A county medical advisory committee has been appointed by each county medical society to work with the county department of public welfare and to provide professional advice through the county department relative to the quality, quantity and cost of medical care. As heretofore the plan for physicians' services is based on free choice of physician by the patient. However, in order to facilitate understanding of the program and foster a closer relationship between the physician and the county department of public welfare, physicians are being asked to apply for placement on a roster from which the patient may choose his physician. After July 1, allowances to recipients to pay for medical care will be made only when services are given by physicians whose names are on the roster. The county department will accept applications from physicians at any time, but only those received by May 1 can be acted on by July 1, when the initial section of the roster becomes effective.

**State Medical Meeting in Springfield**—The one hundred and second annual session of the Illinois State Medical Society will be held at the Hotel Abraham Lincoln, Springfield, May 19-21, under the presidency of Drs. Charles H. Phifer, Chicago. The preliminary program lists the following speakers, among others:

Dr. Frank H. Lahey, Boston, Medicine and the National Program  
Dr. Raymond A. Vonderlehr, Washington, D. C., The Detection of Venereal Disease in the Second Million Selectees  
Dr. Hobart A. Reimann, Philadelphia, Virus Disease and the Soldier  
Dr. Tom B. Throckmorton, Des Moines, (subject not announced)  
Dr. Lowell S. Selling, Detroit, Alcoholism and Traffic Problems  
Dr. Nathan A. Womack, St. Louis, Carcinoma of the Rectum  
General Considerations  
Dr. Hedwig S. Kuhn, Hammond, Ind., Visual Problems in Modern Industry  
Carl E. Buck, D.P.H., New York, Survey of the State Department of Public Health  
Dr. Richard Paddock, St. Louis, The Third Stage of Labor  
Dr. Curtis J. Lund, Madison, Wis., Asphyxia Neonatorum

The oration in medicine will be delivered Tuesday evening by Dr. Cecil J. Watson, Minneapolis, on 'Macrocytic Anemia'. The oration in surgery will be given the same evening by Dr.

Lahey on "Surgical Management of Lesions of the Esophagus, Stomach, Rectum and Colon." The secretaries conference will be held Tuesday evening. Other groups meeting during the session of the state society include the Medical Women's Association, Illinois Society of Pathologists, Physicians' Association of the State Department of Public Welfare, Illinois chapter of the American College of Chest Physicians and the woman's auxiliary to the state medical society.

### KANSAS

**New Executive Secretary**—Mr. D. D. Jeffers, Pittsburg, who for two years has been working with the Crawford County Medical Society in the operation of its medical care plan for indigents, has been named full time executive secretary for the society.

**University Adopts Accelerated Program**—The University of Kansas School of Medicine reports that the next freshman class will be enrolled in June. Upper classes will begin the accelerated program in the fall of 1942. Freshmen will be admitted annually in June and will complete the medical course in three years. These data supersede the information listed on page 142.

**State Medical Meeting**—The eighty-third annual session of the Kansas Medical Society will be held at the Wichita Forum, Wichita, May 11-14, under the presidency of Dr. Clyde D. Blake, Hays. The medical societies of Sumner, Pratt and Cowley have cooperated with the Sedgwick County Medical Society in the preparations for this meeting. Included among the guest speakers will be:

Dr. Cyril M. MacBride, St. Louis, Synthetic Estrogens and Their Use.  
Dr. Harry E. Vock, Chicago, Management of Skull Fracture and Brain Injuries.  
Dr. Alan Brown, Toronto, Ontario, Canada, Feeding Difficulties Encountered in the Newborn Period.  
Dr. Frank H. Lahey, Boston, President, American Medical Association, Lesions of the Colon and Rectum.  
Dr. Joe V. Meigs, Boston, Cancer of the Cervix—Changing Concepts of Treatment.  
Dr. William D. Stroud, Philadelphia, Modern Therapy in Cardiology.  
Dr. Paul A. O'Leary, Rochester, Minn., Modern Treatment of Syphilis.  
Dr. Charles W. Mayo, Rochester, Treatment of Duodenal Ulcer.  
Dr. John W. Harris, Madison, Wis., Some Practical Aspects of Pain Relief in Labor.  
Dr. John I. Shea, Memphis, Tenn., Modern Treatment of Acute Infections in Otolaryngology.  
Dr. Howard Rommel Hildreth, St. Louis, Detachment of Retina—Diagnosis, Management and Surgical Results.

The program includes in addition to the general sessions a group of round table discussions covering a wide range of subjects. Dr. Lahey will address the annual banquet on Wednesday evening. Other groups meeting at this time include the Kansas Obstetrical and Gynecological Society and the woman's auxiliary to the state medical society. The Kansas Medical Assistants Society will also meet on May 11 at the Alhambra Hotel.

### KENTUCKY

**Hospital News**—The Central State Hospital at Lakeland has been built at a cost of \$93,000. Special ceremonies were held on March 24 to open and dedicate the institution.

**Course on Industrial Health**—A nine weeks course for the senior medical students at the University of Louisville School of Medicine, Louisville, has been arranged by Dr. Walter E. Doyle, Louisville. The course will include lectures and field trips.

**Personal**—Dr. Amphas W. Davis, Madisonville, has been appointed a member of the state board of health for a term ending Dec. 31, 1947, succeeding Dr. Ernest L. Gates, Greenville, whose term has expired.—Dr. Frank Marion Melton, Brandenburg, has been appointed health officer for the unit in Oldham County.

**Psychiatrists Elect Officers**—Dr. John D. Reichard, medical officer, U. S. Public Health Service Hospital, Lexington, was chosen president-elect of the Kentucky Psychiatric Association recently and Dr. William K. Keller, assistant director of mental hygiene, Louisville City Hospital, was installed as president. Other officers include Drs. Abraham Wikler, Lexington, vice president, and Louis M. Foltz, Lakeland, secretary-treasurer.

### LOUISIANA

**School Health Survey**—The Louisiana board of health recently completed a survey to determine health needs among school children of the state. A report points out that while the group examined was small it does reflect all strata of the population of the state. A total of 779 children of whom 353 were white and 426 were colored was examined in seventeen parishes of the state. The examination included a general physical examination to determine nutritional status and gen-

eral health conditions, a thorough dental examination, vision and hearing tests, and laboratory tests. It was found that 44 per cent of the group were judged as undernourished, 56 per cent needed some treatment or the removal of tonsils, 86 per cent had dental defects in need of correction, 10 per cent had visual defects in need of correction, 25 per cent showed defective hearing, 33 per cent had poor posture, 24 per cent of feces specimens submitted were found with intestinal parasites of one kind or another, 6 per cent of the colored children were found with syphilis and 5 per cent had doubtful reactions. None of the white children had positive serologic reactions for syphilis. In connection with the survey, 14,665 chest roentgenograms were made on grammar, high school and college students, resulting in the detection of 7 significant cases of tuberculosis, another 696 showed calcified evidence of the primary type of infection. The report points out that, if the results of this survey are true of the school population as a whole, the school children are not a healthy group and recommends a broadening of present programs in public health and public health education.

### MASSACHUSETTS

**Position as Medical Director Open**—Applications are being received to fill the position of full time medical director of the state medical society's prepayment medical care insurance plan. Only physicians are eligible. The salary has not as yet been fixed, but physicians interested in securing information concerning the position should communicate with Dr. Pierce H. Leavitt, 129 West Elm Street, Brockton, chairman of the committee to select the medical director. The society's plan cannot begin to function until a medical director is employed.

**Regional Meeting of Chest Physicians**—The New England Chapter of the American College of Chest Physicians will hold a meeting at the Harvard Club, Boston, May 18. Dr. Aleksei A. Leonidoff, Poughkeepsie, N. Y., will speak on "Psychiatric Problem of Tuberculosis in Mental Hospitals" and Mr. Murray Kornfeld, Chicago, executive secretary of the American College of Chest Physicians, on "Chest Specialists and the War Effort." Members of the American Psychiatric Association, who will meet in Boston May 18-22, have been invited to attend the meeting.

**Accelerated Training Program for Public Health Workers**—The Massachusetts Institute of Technology, Cambridge, announces a special intensive and accelerated training program for public health workers to meet the growing shortage in the profession. Clair E. Turner, Sc.D., professor of biology and public health at the institute, will direct the work to provide adequate training for public health administrators, public health engineers, public health educators and public health bacteriologists. The first period will begin on June 8 and continue through July 24. The second term will run from July 27 to September 12. In addition, a similar program for state graduate students will open on June 8 and continue through February 6. The completion of this course will lead to a degree of master of public health or a certificate in public health. Another course will be offered for public health bacteriologists and one for the training of health educators.

**State Medical Meeting in Boston**—The Massachusetts Medical Society will hold its one hundred and sixty-first annual meeting at the Hotel Statler, Boston, May 25-27 under the presidency of Dr. Frank R. Ober, Boston. Among the speakers will be:

Dr. Henry E. Meloney, New York, The Problem of Certain Tropical Diseases in the War.  
Dr. Raymond A. Vonderlehr, Washington, D. C., Impact of the War on the Venereal Disease Problem.  
Dr. Morris Fishbein, Editor of THE JOURNAL, Chicago, Medicine and the War.  
Dr. Joseph F. McCarthy, New York, Interrelation of Anesthesia with Analgesia.  
Dr. Rolla E. Dyer, Washington, D. C., Typhus.  
Mr. John M. Pratt, Chicago, World Conflict and Medical Service.  
Dr. Virgil H. Moon, Philadelphia, The Vascular Dynamic Response and Management of Shock.

There will be symposiums on minor psychiatric disorders in war and civilian life and bronchial obstructions. The address of the day will be delivered Tuesday morning by Dr. William Castle, Boston, on "Medical Therapy." The annual dinner will be held in the evening with Dr. Fishbein and Dr. Lahey, Boston, President American Medical Association, as the speakers. On this occasion Dr. John I. Fulton, professor of physiology, Yale University School of Medicine, New Haven, will deliver the Shattuck Lecture on "The Air and Air Supremacy."

## MICHIGAN

**Course for Operators of Milk Plants**—The School of Public Health of the University of Michigan Ann Arbor is offering a course for operators of milk plants May 12-13 as a part of the civilian defense program. Instruction in health and sanitary services for the operators of pasteurization plants will be given. Business and trade aspects will be left to other agencies. Among the speakers will be

James A. Tobey, Dr. P.H. milk consultant, New York Sanitation in Milk Plant Operation Pays Dividend  
Robert S. Breed, Ph.D., professor of bacteriology, New York Experiment Station, Geneva, N.Y., The Problem of Bacteria in Milk  
Dr. Milton J. Rosenau, dean, School of Public Health, University of North Carolina School of Medicine, Chapel Hill, N.C., Theory and Practice of Pasteurization  
Walter von D. Tiedemann, Albany, chief, division of milk sanitation, Bureau of Engineering, New York State Department of Health, Mechanics of Pasteurization

## MINNESOTA

**Annual Journal-Lancet Lecture**—Herald R. Cox, Sc.D., associate bacteriologist, U.S. Public Health Service, stationed at the laboratory in Hamilton, Mont., will deliver the second annual *Journal-Lancet* lecture at the University of Minnesota Medical School, Minneapolis, May 22. His subject will be Typhus Fever, with Special Reference to Epidemiology and Immunity.

## MISSISSIPPI

**State Medical Meeting in Jackson**—The seventy-fifth annual session of the Mississippi State Medical Association will be held at the Robert E. Lee Hotel, Jackson, May 12-14 under the presidency of Dr. Augustus Street, Vicksburg. Included among the speakers will be

Dr. Wiley R. Buffington, New Orleans, Retinal Detachment Its Surgical Correction, Preoperative and Postoperative Care  
Dr. Theodore A. Watters, New Orleans, The Consideration of Mental Health as a Part of a State Health Program  
Dr. Don W. Gudakunst, New York, Recent Research in Poliomyelitis  
Dr. Ralph Bowen, Houston, Texas, The Practical Management of the Asthmatic Child  
Dr. Frederick A. Willis, Rochester, Minn., Hypertensive Heart Disease  
Dr. John Albert Key, St. Louis, Compound Fractures  
Dr. Leonard G. Rowntree, chief of medical division, Selective Service System, Washington, D.C., The Future of Medicine in Selective Service  
Capt. Lucius W. Johnson, U.S. Navy Hospital, Pensacola, Fla. (subject not announced)  
Dr. Charles L. Williams, Jr., U.S. Public Health Service, Wadesboro, N.C. (subject not announced)

At the evening session Tuesday, Dr. William A. Evans, Aberdeen, will deliver the Ewing Fox Howard Oration on Jefferson Davis, Some of His Diseases and His Doctors. The Mississippi State Hospital Association will hold its meeting at the Heidelberg Hotel, Jackson, May 11. Its program will include panel discussions on war and hospitals and hospitalization insurance. Among others, Dr. Julius H. Hess, Chicago, will address the annual meeting of the Mississippi Pediatric Society at the Robert E. Lee Hotel, May 11, on "Celiac Disease" and "The Care of the Premature Infant." Speakers before the Louisiana-Mississippi Ophthalmological and Otolaryngological Society at the Heidelberg Hotel, May 11, will include Drs. James H. Maxwell, Ann Arbor, Mich., on "Acute Swellings of the Face and Neck," James W. White, New York, "Surgery of the Obliques: The Indications and Contraindications," and Henry P. Wagener, Rochester, Minn., "Clinical Significance of Certain Vascular Lesions in the Retina." Dr. Murdock S. Eque, Atlanta, Ga., will deliver the Raymond Hume address on "Laryngoscopic and Bronchoscopic Studies." The eighteenth annual convention of the women's auxiliary to the Mississippi State Medical Association will be at the Robert E. Lee Hotel, May 12-13.

## NEW JERSEY

**Society Refuses to Support Bill to Aid Examining Board**—The house of delegates of the Medical Society of New Jersey at its recent annual meeting in Atlantic City rejected overwhelmingly the state board's plea for support of a proposed law that would require all New Jersey physicians to contribute \$2 a year each toward its support according to the *New York Times*. Physicians who led the opposition argued the state examiners did not serve the doctors at all but served the public and therefore the taxpayers should pay the cost. The *Times* reported that the state board of medical examiners had only \$41 in its treasury. A special meeting of the board is planned for May 20 to discuss means of obtaining needed funds.

## NEW YORK

**State Medical Election**—Dr. Thomas A. McGoldrick, Brooklyn, was named president elect of the Medical Society of the State of New York at its annual meeting in New York on April 28 and Dr. George W. Cottis, Jamestown, was inducted into the presidency. Dr. Peter J. Di Natale, Batavia, was elected second vice president. Other officers were reelected according to the *New York Times*. The 1943 meeting will be in Buffalo.

**New Director of Study of Parole and Family Care**—Dr. Reginald R. Steen has been given a leave of absence as first assistant physician at Kings Park State Hospital, Kings Park, to direct a study of parole and family care of the temporary commission on state hospital problems. He succeeds Dr. Frank F. Tallman who resigned to become director of mental hygiene for the Michigan State Hospital Commission. Lansing Central (N.Y.) State Hospital with an urban population and the Marcy (N.Y.) State Hospital with patients from rural areas were selected for the study. The objective of which is to determine to what extent additional psychiatric social work results in increasing paroles and family care.

**Accidents in the Home**—A five point program was drawn up at a conference in Albany in March of sixty representatives of national, state and local organizations to plan an offensive against accidents in the home and on the farm. The conference also voted to continue the farm and home safety work under the direction of the state department of health with the cooperation of the groups represented and to appoint an advisory committee to plan a state conference in Syracuse on May 29 when an institute will be held for the training of leaders in home safety, the development of committees to work in the various fields of home and farm safety and the outlining of methods. The five point program aims at determining quickly what has already been done about home and farm safety in the state, perfecting statewide organization with all possible speed, planning state county and community conferences disseminating to all participating groups practical information on methods of combating the problems and developing a plan for intensive follow-up work.

## New York City

**Symposium on Sulfonamides**—The New York Academy of Pharmacy devoted its meeting April 30 to a symposium on the "Action and Uses of Sulfa Drugs" with the following speakers: Curt P. Wimmer, Ph.D., Review of Chemistry and Pharmacology of Sulfa Drugs; Dr. Elias Wilhami Abramowitz, Sulfonamides in the Treatment of Various Skin Diseases; Dr. Milton A. Miller, "The Sulfonamides in Non-pneumonic Conditions" and Dr. Solomon Biloon, "The Sulfonamides in Pneumonia."

**Body and Mind Clinic Accused of Violating Medical Practice Laws**—The Body and Mind Foundation Inc. of which Dr. Edward Spencer Cowles is director is accused in an information filed by the New York County Grand Jury of having violated the state laws governing the practice of medicine, according to the *New York Times*. Simultaneously with this announcement was a report that proceedings had been started for revocation of the license of Dr. Cowles. The information named Robert Rebold and Evelyn Dolm (also given as Evelyn Dolm Schulman) the self-styled psychologists as violators of the state medical laws. The information containing five counts charged the corporation Rebold and Dolm with the unlawful practice of medicine with maintaining operating and conducting a dispensary and clinic from May 3, 1934 up to April 15, 1942 without having first obtained a license with displaying signs and other things on which were written the words "dispensary" and "clinic" in violation of the social welfare law, with conspiracy to violate the Education law by practicing medicine unlawfully and the defendant Rebold alone with violation of the Education law in that he used the title M.D. and other designations that implied he was a practitioner of medicine. The disciplinary charges were made against Dr. Cowles by State Inspector Albert A. Bucholz who accused the doctor of having associated with and cooperated with the Body and Mind Foundation Inc. a corporation that he alleged was practicing medicine and of having associated with Rebold and Dolm in the illegal practice of medicine. Bucholz charged that Dr. Cowles represented his associates as licensed and qualified to practice medicine. The *Times* further reports that Dr. Cowles was accused by Inspector Bucholz of having used magazines and other publications for the purpose of advertising

contrary to the education law and to misrepresenting the purposes of the corporation, as set forth in the certificate of incorporation. A charge in the petition before the grievance committee sets forth that Dr Cowles was responsible for all the fraud, "deceitful, and wrongful unlawful acts and conduct alleged herein." Dr Cowles, who is widely known as a psychiatrist and neurologist, founded the Body and Soul Medical and Mental Foundation in July 1923. In 1934 the clinic changed its title to The Body and Mind Foundation, Inc., and moved to the East Sixty-Ninth Street address, where thousands have attended the clinics, which became the subject of much comment. It was stated that twelve state investigators made repeated visits to the clinic. The investigators found 200 to 300 patients being treated at once for individual ills, the most frequent treatment consisting of taking a stimulant and listening to suggestions by doctors and other patients that they were getting better, it was stated. Dr Cowles graduated at University College of Medicine, Richmond, Va., in 1907.

## NORTH CAROLINA

**Society Opposes Construction of New Hospital**—The Cumberland County Medical Society on April 6 appeared before the board of county commissioners in opposition to the erection of a \$400,000 hospital in Fayetteville by the federal government, newspapers reported. After hearing the opposition, the commissioners stated that nothing could be done to halt the project. The society contended that there are more than a sufficient number of hospital beds in the county to meet the requirements, that no patient has been refused admittance to any hospital in the county for lack of space, that the construction of such an institution would be unwise at this time because of material needs, that doctors and nurses probably could not be secured to staff the hospital and that the county has no right to operate a hospital without a mandate of the people.

## NORTH DAKOTA

**State Medical Meeting in Jamestown**—The North Dakota State Medical Association will hold its annual meeting in Jamestown, May 18-20, under the presidency of Dr Frederick W Fergusson, Kulm. The speakers will include

Dr Ralph A Reis, Chicago, Obstetrics  
Dr Erling S Platou, Minneapolis, Pediatrics  
Dr Stanley R Maxeiner, Minneapolis, Fractures  
Dr W Wright Bethesda, Md, Trichinosis  
Dr Lawrence R Boies, Minneapolis, Symptom of Headache  
Dr Gordon R Krimman, St Paul, The Depressed Patient

Dr Edward C Rosenow, Rochester, Minn., and Herald R Cox, Sc D, Hamilton, Mont., will participate in a symposium on "Infectious Encephalomyelitis." The North Dakota State Health Officers Association will meet on May 18 and the North Dakota Academy of Ophthalmology and Otolaryngology on May 19.

## OHIO

**New Supervisor of Health**—Paul E Landis, associate professor of physical education at Bowling Green State College, Bowling Green, has been named state supervisor of health, physical education, recreation and safety, effective March 1. This position was created within the department of education to cooperate with federal defense agencies now promoting a program "for improving the health and physical status of the people," according to *Ohio Public Health*. Mr Landis received his M A degree at Teachers College, Columbia University, New York.

**Grant for Study of Adolescent Children**—The General Education Board of the Rockefeller Foundation has given the Brush Foundation of Western Reserve University School of Medicine, Cleveland, a supplementary grant of \$15,000 for one year to be used in completing its study of the growth and development of adolescent children. The study was begun in 1935 by the late Dr T Wingate Todd and has been continued by William Walter Greulich, Ph D, director of the Brush Foundation and professor of physical anthropology and anatomy in the school of medicine.

## OREGON

**Personal**—Dr Irvin R Fox, Eugene and J L Ingle, D O, La Grande have been reappointed members of the state board of medical examiners.—Dr Edward J Delne, Coquille, health officer of Coos County has been ordered to active duty with the army.—Dr Vernon A Douglas, Salem health officer of Marion County, has been appointed medical officer for the Oregon state defense council.

## PENNSYLVANIA

**Additional Care for Blind**—Plans are under way to launch a new expanded program providing additional care for blind and visually defective persons in Pennsylvania. The program was authorized by the last general assembly. The state council for the blind will administer the plan, which will be far more comprehensive than the state's past activities for the blind and visually defective persons. Regional supervisors will be assigned to various sections of the state to carry on the work in defined areas, according to the *Pennsylvania Medical Journal*.

### Philadelphia

**The Jarecki Lecture**—The eighth Edwin A Jarecki Memorial Lecture was delivered at Jewish Hospital on April 23 by Dr Elliott P Joslin, Boston. His subject was "The Responsibility of Being a Diabetic."

**New Professor of Proctology**—Dr Harry E Bacon has been elected professor and head of the department of proctology at Temple University School of Medicine. Dr Bacon is a native of Philadelphia and graduated at Temple in 1925. He is co-founder and past president of the Proctologic Society of the Graduate Hospital of the University of Pennsylvania, according to an announcement.

**Endocrine Clinic Opened at Jefferson**—A new clinic has been organized at Jefferson Medical College of Philadelphia for clinical research and teaching of endocrinology. It will also function in the diagnosis and treatment of endocrinopathies. Dr Karl E Paschikis, J Ewing Mears Teaching and Research Fellow in Physiology and Medicine, is the chief clinical assistant.

## SOUTH CAROLINA

**Personal**—Dr William Weston Sr, Columbia, was presented with a silver platter and scroll by the Columbia Medical Society at a meeting, March 10, in honor of his "outstanding work and contributions to the society."

**First Case of Smallpox in Years**—Spartanburg newspapers reported recently that 924 residents of the Glendale section were vaccinated against smallpox, following the report of 1 case of the disease, the first in several years in South Carolina.

**The Sims Lecture**—Dr Tinsley R Harrison, professor of medicine, Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, N C, delivered the second annual J Marion Sims Lecture on April 17 at the Medical College of the State of South Carolina, Charleston. His subject was "Cardiac Dyspnea."

## SOUTH DAKOTA

**Accelerated Program Adopted by University**—Since the compilation of table 2 on page 143 in this issue of THE JOURNAL the University of South Dakota School of Medical Sciences, a school of the basic medical sciences, has announced the adoption of the accelerated program. Classes will begin on June 15 for both years and end on Feb 23, 1943. The subsequent freshman class will begin on March 8, 1943.

## TENNESSEE

**State Medical Election**—Dr Oval N Bryan, Nashville, was chosen president-elect of the Tennessee State Medical Association at its annual meeting in Memphis, April 16, and Dr James B Stanford, Memphis, was inducted into the presidency. Vice presidents are Drs Samuel J Fentress, Goodlettsville, for the Middle Tennessee area, Featherston Dougherty, Dyer, for West Tennessee, and Burton L Jacobs, Chattanooga, for the East Tennessee area. Dr Harrison H Shoulter, Nashville, was reelected secretary-editor.

## TEXAS

**Special Society Elections**—Dr Eugene L Allen, Dallas, director of the Dallas Child Guidance Clinic, was chosen president of the Texas Society for Mental Hygiene at its annual meeting in Fort Worth. Miss Lucile Allen, Dallas, secretary-treasurer. The next annual session will be in Dallas. Out of state speakers at the recent meeting included Dr George S Stevenson, New York, and Horton K C, Nashville, Tenn.—Mr A C Scwell, whom that City and County Hospital of Fort Worth was chosen president-elect of the Texas Hospital Association. Mr. Max, Falls, is president and Miss Madeline Sturdivant, Falls, is executive secretary.

## PHILIPPINE ISLANDS

**Dr Whitacre Interned in Manila**—Dr Frank L. Whitacre, professor of obstetrics and gynecology at the Peiping Union Medical College, Peiping, China, is interned in Manila, newspapers reported, March 31. He with his family was evacuated from Peiping but remained in Manila when his wife and her sister returned to the United States.

## PUERTO RICO

**Blood Bank at School of Medicine**—The School of Tropical Medicine, San Juan, started the operation of a blood bank at the school on April 7 in connection with a program of civilian defense. Among the speakers of the occasion were Dr Oscar G. Costa-Mandry, Dr Eduardo Garrido Morales, Mr Jaime Annex, Dr Pablo Morales Otero and Dr Artajerjes Oliveras-Guerra, all of San Juan.

**Water Borne Outbreak of Typhoid**—Thirteen cases of typhoid with two deaths were recently reported in an outbreak in the municipality of Juana Diaz, which has a population of 23,396. The 13 cases were evenly distributed over the town. An investigation disclosed the public aqueduct to be the only factor common to all the patients. A resident living a few yards from a dam at the source of water supply was found to be a typhoid carrier and gave a history of having defecated above the impounding place of the water, which is served without any protection or treatment to the inhabitants of the town of Juana Diaz. No other case appeared after the public water was properly chlorinated.

## GENERAL

**First Award of Nutrition Grants**—The Nutrition Foundation, Inc., recently organized with the support of the food industry, announces that its first series of grants will be made to promote research and education in the science of nutrition, effective July 1. The grants will be made following action to be taken by the foundation trustees at their May meeting.

**Meeting of Laryngologists**—The American Laryngological Association will hold its sixty-fourth annual meeting at the Marlborough-Blenheim Hotel, Atlantic City, May 25-27, under the presidency of Dr Thomas E. Carmody, Denver. Included among the speakers will be

Dr Thomas C. Galloway, Evanston, Ill. Infection with Anaerobic Streptococci with Special Reference to Cranial Osteomyelitis.  
Dr Daniel S. Cunningham, New York. Chemotherapy: Especially the Use of the Newer Sulfocompounds in Nose and Throat Diseases.  
Drs Frederick A. Figi and Charles H. Watkins, Rochester, Minn. The Treatment of Hereditary Telangiectasia of the Nose.  
Dr E. Fernandez Soto, Havana, Cuba. Contribution to the History of Laryngology in Cuba.  
Dr Oscar V. Batson, Philadelphia. The Veins of the Pharynx.  
Dr Maurice Lenz, New York. A Ray Therapy of Diseases of the Larynx.

**Medical Bowling Tournament Canceled**—The annual tournament planned by the American Medical Bowling Association in Atlantic City, June 8-12, has been canceled. Instead a national medical bowling sweepstakes will be held on June 6, played on a handicap basis on the home alleys in the cities from which the teams may enter. The sweepstakes has been given an official sanction by the American Bowling Congress and will be played under the rules of that organization. The sweepstakes will be for five man teams, doubles, singles and all events to establish the national champions for these various events. Teams will be handicapped on a two thirds basis from 950, doubles on a two thirds basis from 380 and singles on a two thirds basis from 190. The team play will be in the afternoon of June 6, the doubles and singles in the evening. Entries will close at midnight May 23. This is necessary because every entry must be checked by the American Bowling Congress. Entry blanks may be obtained from Dr Joseph J. Jelinek, 1052 West Sixth Street, Los Angeles, acting secretary of the American Medical Bowling Association.

**Knudsen Award Goes to Clarence Selby**—The W. S. Knudsen Award of the American Association of Industrial Physicians and Surgeons has been presented to Dr Clarence D. Selby, Detroit, since 1935 medical consultant to the General Motors Corporation, for "the most outstanding contribution to industrial medicine." The presentation took place during the association's annual meeting in Cincinnati on April 15. Dr Selby was born in Des Moines on July 21, 1878. He graduated at the Western Reserve University School of Medicine, Cleveland, in 1902. During his career he has served as commissioner of health of Toledo, Ohio, consulting hygienist of the U. S. Public Health Service, secretary and chairman of the Section on Preventive Medicine and Public Health and Industrial Medicine, American Medical Association and since

1938 as a member of its Council on Industrial Health. Since 1940 he has been chairman of the subcommittee on industrial health and medicine, Office of Defense Health and Welfare Service, Office of Emergency Management. In 1938 he was president of the American Association of Industrial Physicians and Surgeons, in 1925 of the Ohio State Medical Association, in 1923 of the Ohio Public Health Association and from 1922 to 1928 of the Toledo Public Health Association. The Knudsen Award was established in 1938 by William S. Knudsen, then president of the General Motors Corporation.

**Association on Mental Deficiency**—The sixty-sixth annual meeting of the American Association on Mental Deficiency will be held at the Hotel Bradford Boston May 13-16, under the presidency of Dr Fred O. Butler, Eldridge, Calif., whose address will be entitled "The Defective Delinquent." Among other speakers will be

Dr Hubert H. Ramsey, American Fork, Utah. How the High Grade Mentally Defective May Help in the Prosecution of the War.  
Dr Edgar C. Yerbury and Nancy Newell, Ed M., Boston. Factors in the Early Behavior of Psychotic Children as Related to Their Subsequent Mental Disorder.  
Dr Clemens E. Benda, Wrentham, Mass. Congenital Syphilis in Mental Deficiency.  
Emil M. Bixby, Ph.D., Wrentham. Hormone Studies in Mongolism.  
Dr Raymond W. Waggoner, Ann Arbor, Mich. Agenesis of the White Matter as an Hereditary Disorder.  
Dr Charles Stanley Raymond, Wrentham. Mental Deficiency as a Community and Institutional Problem.  
Dr Douglas A. Thom, Boston. Psychiatric Problems of Children in Time of War.  
Dr Lowell S. Selling, Detroit. Feeble-minded Drivers.  
Dr George A. Jervis, New York. Histologic Studies of Brain Cortex in Certain Types of Mental Defect.

The program will conclude Saturday morning with a symposium on educational provisions for mentally deficient adolescents.

## CANADA

**Outbreak of Poliomyelitis**—Thirteen cases of poliomyelitis with one death were reported on April 20 in an outbreak in the parish of Drummond, Victoria County. The youngest patient was 20 months old and the oldest 11 years.

**Personal**—Dr John H. Holbrook, Hamilton, Ontario, superintendent of the Mountain Sanatorium, was presented with the city's outstanding citizenship medal for 1941 recently for his efforts over a period of thirty years to cut the death rate from tuberculosis in the city.

## Government Services

### Narcotic Hospital to Be Used for Mental Patients

The U. S. Public Health Service Hospital at Fort Worth used since its opening in 1938 for the care and treatment of narcotic addicts only, will soon be used for the treatment of mental patients also, according to the Fort Worth *Star-Telegram*. An initial group of 150 mental patients will be transferred from St. Elizabeths Hospital, Washington, D. C. Dr Grover A. Kempf, former medical officer in charge of the U. S. Marine Hospital, Boston, a psychiatrist, was recently appointed officer in charge of the Fort Worth hospital. He succeeds Dr William F. Ossenfort, Fort Worth, head of the hospital since its opening, who has been appointed assistant surgeon general of the public health service in charge of the hospital division.

### Physical Fitness Division Abolished

The Division of Physical Fitness formerly part of the Office of Civilian Defense was abolished on April 15 by Federal Security Administrator Paul V. McNutt, according to the New York *Times*. Many of the staff members were dismissed, effective May 1, and their activities absorbed immediately by Mr. McNutt's Office of Defense Health and Welfare Services. The director of the division, John B. Kelly, will continue in the new setup with the title of assistant director of defense health and welfare services. He will have no office in Washington and no authority outside Philadelphia, it was stated. All of the sports coordinators whom Mr. Kelly named throughout the country to promote recreational activities were dropped by Mr. McNutt although he said in a statement that he hoped they would continue to promote these vital community programs on their own. The *Times* reported.

## Foreign Letters

### LONDON

(From Our Regular Correspondent)

March 21, 1942

#### British Doctor Dies of Typhus in German Camp

Major A. Keith Gibson, a Scottish doctor in the Army Medical Corps, has died of typhus in a German prison camp. He contracted the disease from Russian prisoners whom he was attending. Under the Geneva convention a medical prisoner of war cannot be asked to assist in the treatment of infectious diseases. It is stated that Dr. Gibson volunteered to help to relieve the acute miseries of the Russians. In a report to the Swiss Red Cross the German medical authorities pay tribute to his self sacrifice, and he was buried with full military honors. He worked hard in caring for the men constantly being sent into the camp hospital. He was ill for a fortnight, during which his fellow prisoners worked night and day to save his life. He was captured at Boulogne after the evacuation of Dunkirk. Until December 1939, when he volunteered for military service, he was regional secretary of the London area of the British Medical Association.

#### Anglo-Soviet Medical Relations

Before the war there was little cultural interchange between Britain and the Soviet Union, owing to some dislike in each country for the political system of the other. The war has now brought them together and done something to dispel prejudices on both sides as well as to encourage closer relations. An example is the formation of an Anglo-Soviet medical committee, of which Sir Alfred Webb-Johnson, president of the Royal College of Surgeons, is chairman. The January issue of the *Postgraduate Medical Journal* is entirely devoted to Soviet medicine. In a foreword Russian ambassador Maisky states that an exchange of medical experiences both in time of peace and in time of war will prove of immense benefit to both countries. Sir Alfred Webb-Johnson as president of the Anglo-Soviet committee contributes an introduction in which he welcomes the special issue devoted to Anglo-Soviet medicine.

Dr. D. C. Bunn, honorary secretary of the Anglo-Soviet Medical Committee, says that the most urgent aim is transmission of English material to the Soviet Union. The other side of the picture is to make available here translations of Russian medical literature. English journals, including the *Bulletin of War Medicine* have been dispatched to Russia, also reviews of recent work on malaria, maxillofacial injuries and the treatment of burns and acute war neuroses.

#### Employment of Alien Physicians in Hospitals

The calling of physicians for the fighting forces has produced a shortage of those available for hospitals which is being remedied by the employment of alien physicians subject to regulations issued by the Ministry of Health. The maximum proportion of alien to British physicians employed as residents by any hospital was laid down. As this regulation has been found too restrictive in certain cases it has been relaxed. It was laid down that not less than two British resident physicians should be employed in any hospital employing an alien physician. The necessary number has now been reduced to one. For the hospitals which employ only one resident physician there is a further relaxation allowing them to employ an alien at the prior consent of the minister of health has been obtained. Larger hospitals are permitted to employ a greater percentage of alien physicians. The minister of health stresses the valuable assistance in meeting the pressing problem of medical manpower by the employment of alien physicians.

#### British Medical Unit for China

The offer of the British Red Cross to send a unit to China has been accepted. It will consist of full equipment for a hospital of two hundred beds and a staff of twenty-six consisting of an administrator, four surgeons, three physicians, a pathologist, a radiographer, a storekeeper, accountant, a matron and fourteen nurses. Dr. Wellington Koo, the Chinese ambassador, has informed Field Marshal Sir Philip Chetwode, chairman of the executive committee of the St. John War Organization, that the Chinese have accepted the offer with deep appreciation. The unit will cooperate with the Chinese Red Cross and the British Fund for the Relief of Distress in China. Physicians and nurses who have a knowledge of Chinese are invited to communicate at once with the secretary of the Medical Aid to China Sub-Committee, 14 Grosvenor Crescent, London, S. W. 1.

#### The American Hospital in Britain

The duchess of Kent has opened the new Churchill Hospital at Headington, near Oxford, which is to be the home of the American Hospital in Britain. This project was made possible by an American organization, the British War Relief Committee, a representative of which, Mr. Bertram de N. Cruger, attended the opening ceremony. About two thirds of the new hospital will be orthopedic, and it will form part of the Oxford Orthopedic Center. It will be in charge of Professor Wilson who has brought over in addition to orthopedic surgeons Dr. John M. Converse for plastic surgery, Dr. Rogers McGill for general surgery and Dr. Kirkland, who will take charge of medicine and clinical pathology. The present staff includes twelve American doctors and fifty American and Canadian nurses. The hospital contains six hundred beds and, because of air raids, is constructed on a novel plan. The wards are built round a courtyard and each has its own air raid shelter. In its previous hospital, at Basingstoke, Professor Wilson's unit has American surgeons trained in the methods of war surgery. It is hoped that the Churchill Hospital may eventually be taken over by the American army as its first base hospital in Europe.

#### Polish Professor Honored

At the annual Buckstone Browne luncheon of the Royal College of Surgeons the honorary fellowship was conferred on Prof. Antoni Jurasz, dean of the Polish Faculty of Medicine in Edinburgh University (*THE JOURNAL*, March 29, 1941, p. 1469). The president, Sir Alfred Webb-Johnson, said that in common with the whole civilized world, Britain had been horrified by the calculated brutality of the treatment of the Poles and by the deliberate plan to destroy their centers of intellectual life. Though Poland held a premier place among the persecuted peoples of the world, her national culture had survived all attempts to destroy it. The first essential step toward restoration was training young men and women for the task. We had been deeply impressed by the remarkable achievement of establishing a Polish faculty of medicine in the University of Edinburgh. In reply Professor Jurasz said that it was only through this war that the great Western democracies had come fully to realize that in a nation's struggle for liberty the decisive factor was not the number of inhabitants, their wealth or the absolute superiority of their armed forces, but the spirit inherent in each individual.

#### Some Increase in Tuberculosis

It has been stated in previous letters that the national tuberculosis during the war has improved. In the case of males there has been some slight increase. The most marked increase is in tuberculosis which was also observed to increase in the war of 1914-1918. A progressive decrease in

dence of this disease has been going on since 1919 but in 1940 the first complete war year the mortality showed a rise which was most noticeable in young women between the ages of 15 and 25. Their death rate per million rose from 762 in 1939 to 881 in 1940 compared with a rise in the tuberculosis death rate of all ages for both sexes from 535 to 587. More recent figures for the first quarter of 1941 show a slight decline compared with the corresponding quarter of 1940.

The minister of health has issued a circular to the local health authorities pointing out the importance under war time conditions that both the preventive and the curative arrangements for tuberculosis should be fully maintained. He urges them to review their present arrangements for care and after-care and wherever possible to improve and extend them. It is more bed accommodation is required than is available in any district cooperative arrangements should be sought with neighboring authorities. In many districts the problem of adequate nursing is even more acute. The minister is endeavoring to remedy the shortage of nurses by encouraging recruitment.

### RIO DE JANEIRO

(From Our Regular Correspondent)

April 16 1942

#### Malaria in the Amazon Basin

The total mobilization of the resources of the Western Hemisphere has emphasized the paramount problem of protecting the health of laborers in the tropical sections of the Americas especially those in the Amazon Valley in South America where there are millions of native rubber trees loosely scattered over the largest fluvial basin of the world. Although the Amazon is not the longest river its basin is the largest (2 500 000 square miles against 1 275 000 of the Mississippi-Missouri). Of this enormous basin 1 288 500 square miles are malaria infested jungles within the largest two states of Brazil—Amazonas and Para—and the national Acre Territory, the latter on the upper river near the Peruvian border. The area of these two states and the Acre Territory corresponds to 43 per cent of continental United States and 39 per cent of the whole of Brazil. The health condition of the Amazon Basin has again been brought to the public attention by the arrival in Rio de Janeiro a few days ago of two American experts Dr George Dunham director of the Health Division of the Bureau of the Coordinator of Inter-American Affairs and Dr George Saunders, tropical diseases specialist who are here to confer with the federal health authorities before leaving for the Amazon region.

From time to time scientific expeditions are sent to survey the Amazon region and reports have been published. This great region and its population largely consisting of native Indians and immigrants from the semiarid northeastern section of Brazil is periodically subjected to halt starving droughts. Among the health surveys is the valuable one conducted by Oswaldo Cruz in the first decade of the present century. One of the consequences of this survey was the establishment of a plan of malaria control for the valleys of the Madeira and Mamore rivers two great tributaries of the Amazon which has permitted the construction of the Madeira-Mamore Railroad creating a sure connection with Bolivia and thus opening an important section of the Andes plateau into the Atlantic littoral. The malaria control plan designed by Oswaldo Cruz the execution of which permitted the gathering of thousands of laborers in the heart of the equatorial jungle was a sanitary feat comparable to the work of Gorgas in Panama. In the Amazon region there are malaria hookworm disease yaws amebiasis leishmaniasis yellow fever leprosy syphilis and food deficiency diseases. But malaria is the most important health problem. The total population of the region is 1 450 000 or 11 inhabitants per square mile and there are only two cities of middle size. Iquitos at the mouth of the Amazon River with 100 000 popu-

lation and Manaus in the interior with 210 000. The rest of the population is scattered in a hundred settlements of 500 to 8 000 each mainly occupied in agriculture (rubber, Brazil nuts, timber) and fishing.

During 1941 the Federal Health Service in cooperation with the health departments of the states of Amazonas and Para conducted a special survey in many of these settlements to make it possible to lay out a plan of malarial control. It has been planned to use experts and technicians from Rio de Janeiro and São Paulo to ascertain many important features of the biology of the Anopheles fauna of the Amazon and the extent and severity of the disease. The findings of the survey have just been published in the 1941 annual report of the General Director of the Federal Health Service. According to the report the principal carriers of malaria in the Amazon region are *Anopheles albitarsis*, *Anopheles darlingi*, *Anopheles oswaldoi*, *Anopheles pessoai*, *Anopheles tarsimaculatus* and *Anopheles triannulatus*. In the coastal districts the most important vector is *A. albitarsis*, in the hinterland the predominant carriers are the *tarsimaculatus* and *triannulatus* species. The forty-nine settlements that have been surveyed aggregate a total population of 90 000, out of which more than 18 000 individuals have been examined. In all the forty-nine surveyed settlements the malarial disease is endemic. The splenic index of these localities has been found to vary from 0.2 to 73 with the median value of 24, the hemoscopic index has been found between 0 and 39 with the median value of 7.5. The studies are in progress now, and it is expected that they may be accelerated in order to enable the health authorities soon to begin the real control work with the invaluable cooperation of the coordinator of Inter-American affairs through the action of Dr Dunham and Dr Saunders as field representatives of that agency.

---

## Marriages

---

ARTHUR M. GREENE, Omaha, to Miss Deborah Brunn of Long Island N. Y. in Panama City, Panama recently.

JOHN LUTHER SHIREY, Mount Pleasant, N. C., to Miss Peggy Elaine Johnson in Birmingham, Ala., in March.

EARL CUNNINGHAM MACCORDY to Miss Regina Barbara Melber, both of St. Petersburg, Fla., March 4.

NORMAN F. PEACOCK, Crawfordsville, Ind., to Miss Margaret Weakley of Fort Thomas, Ky., January 10.

IRWIN WARREN WINFIELD, New York, to Miss Carol Estelle Lehman in White Plains, N. Y., March 29.

LEONARD J. ABRAMOVITZ, Baltimore, to Miss Jeanne Elizabeth Daubert of Tannersville, Pa., February 22.

MALCOLM M. DUNHAM, Woodbridge, N. J., to Miss Gladys L. Bitting of Marysville, Pa., March 8.

CREIGHTON WRENN to Miss Charlotte Hutson Martin, both of Mooresville, N. C., in February.

WESLEY LEONARD FURSTE II, Cincinnati, to Miss Leone James of St. Clairsville, Ohio, March 28.

SAMUEL PHILLIPS ASPER, Jr., Boston, to Miss Ann White Carver of Baltimore, March 13.

JOHN PHILLIPS MOORE, Ocala, Fla., to Miss Martha Helen Olsen in Jacksonville, March 1.

ERNEST JEFF HOLDER to Miss Vivian Elizabeth Boykin, both of Prentiss, Miss., January 17.

GLENN MITCHELL SHIPLEY, Louisville, Ky., to Miss Geneva Peace of Pikeview, March 13.

HORACE E. JONES, Anderson, Ind., to Miss Patricia Harden of St. Louis, January 30.

JOHN FRANCIS LING, Hebron, Ind., to Miss Mildred Thomas of Madison, February 1.

ROBERT J. HALEY, Sr., Paragould, Ark., to Mrs. Jewell Bradsher, January 4.

GEORGE F. JOSEPHSON to Miss Mildred Oremland, both of Brooklyn, recently.

## Deaths

**Mary Luise Diez**, Boston, Woman's Medical College of Pennsylvania, Philadelphia, 1903, member of the Massachusetts Medical Society and the New England Society of Psychiatry, director, division of child hygiene, Massachusetts Department of Public Health, obstetrician, division of maternity, infancy and child hygiene, New York State Department of Health from 1922 to 1926 and associate director from 1926 to 1929, associate in surgery, West Philadelphia Hospital, Philadelphia, from 1909 to 1920 and visiting chief obstetrician at the Woman's Hospital, Philadelphia, during the same time, instructor in child hygiene at the Harvard School of Public Health, special lecturer on child hygiene, department of nursing, at Simmons College, aged 62, died, April 12, in the Massachusetts General Hospital, Boston

**Edward Frost Geddings** ♂ Lieutenant Colonel, U S Army, retired, Chevy Chase, Md., Medical College of the State of South Carolina, Charleston, 1890, in October 1900 entered the medical corps of the U S Army as an assistant surgeon, rose through the various grades and was commissioned a lieutenant colonel May 15, 1917, retired Nov 1, 1919 for disability in line of duty, veteran of the Spanish-American War and World War I, aged 73, died, January 6

**Elbert Mortimer Somers**, Sharon, Conn., University of the City of New York Medical Department, New York, 1893, served during World War I, formerly resident officer at the Hudson River State Hospital, Poughkeepsie, N Y, for many years connected with the New York State Hospitals for the Insane, aged 71, died, February 8, of arteriosclerosis and cerebral hemorrhage

**Henry Robertson Skeel** ♂ New York, Columbia University College of Physicians and Surgeons, New York, 1913, member of the Association for Research in Ophthalmology, Inc., served during World War I, served in various capacities on the staff of the Manhattan Eye, Ear and Throat Hospital, aged 56, died, March 22, of coronary thrombosis

**Norman W Bellrose**, Eaton, Colo., University of Vermont College of Medicine, Burlington, 1889, member of the Colorado State Medical Society, past president of the Weld County Medical Society, formerly mayor, health officer and member of the school board, aged 77, died, February 24, in the Greeley (Colo.) Hospital of cardiac decompensation

**Hubert Raymond Stiles**, Chazy, N Y, University of Vermont College of Medicine, Burlington, 1918, coroner of Clinton County, served during World War I, health officer of the town of Chazy since 1926 and of the town of Beekmantown since 1936, aged 49, died, February 10, of bilateral pyonephrosis with calculi and uremia

**John Gardiner Huck**, Hydes, Md., Johns Hopkins University School of Medicine, Baltimore, 1918, formerly assistant professor of medicine at the University of Maryland and College of Physicians and Surgeons, Baltimore, aged 50, died, March 17, in the Union Memorial Hospital, Baltimore, of cerebral hemorrhage

**Edward James Kevlin**, Ponchatoula, La., Medical Department of Tulane University of Louisiana, New Orleans, 1904, formerly secretary of the Tangipahoa Parish Medical Society, member of the local and Tangipahoa parish school boards, aged 62, died, February 4, of bulbar paralysis and amyotrophic lateral sclerosis

**George M Decherd**, Austin, Texas, University of Texas School of Medicine, Galveston, 1905, member of the State Medical Association of Texas, formerly city health officer, for many years a member and at one time president of the school board, aged 61, died, February 26, of coronary occlusion

**John Flavius Dunn**, Arlington, Ky., Hospital College of Medicine, Louisville, 1905, member of the Kentucky State Medical Association, past president and secretary of the Carlisle County Medical Society, owner of a hospital bearing his name, aged 61, died, March 7, of coronary thrombosis

**Orland Paul Shippey** ♂ Saguache, Colo., Gross Medical College, Denver, 1895, past president of the San Luis Valley Medical Society, county health officer, aged 68, died, February 9, in the Denver and Rio Grande Western Railroad Hospital, Salida, of coronary thrombosis

**Philip Finkle** ♂ Miami Beach, Fla., Columbia University College of Physicians and Surgeons, New York, 1918, fellow

of the American College of Physicians, for many years on the staff of the Mount Sinai Hospital, New York, aged 47, died in March of coronary thrombosis

**David Selman**, Cleveland, Western Reserve University Medical Department, Cleveland, 1911, member of the Ohio State Medical Association, served during World War I, aged 55, died, February 3, at his home in Cleveland Heights of acute coronary insufficiency

**Paul John Alspaugh** ♂ New Philadelphia, Ohio, Starling Medical College, Columbus, 1906, on the staff of the Union Hospital, Dover, member of the medical advisory board of the Selective Service System, aged 63, died, March 10, of dilatation of the heart

**Samuel Paul Sobel** ♂ New York, Columbia University College of Physicians and Surgeons, New York, 1906, member of the National Gastroenterological Association, on the staff of the Bronx Hospital, aged 59, died, February 14, of carcinoma of the pancreas

**Frederick P P Von Keller** ♂ Ardmore, Okla., Universität Heidelberg Medizinische Fakultät, Baden, Germany, 1888, medical superintendent of a hospital bearing his name, aged 82, died, February 13, of carcinoma of the pylorus and cirrhosis of the liver

**Roderick Donald McRae** ♂ Hunters, Wash. (licensed in Washington in 1900), formerly physician for the Indian Service, at one time member of the state legislature and county coroner, aged 77, died, March 23, in a hospital at Spokane of heart disease

**Christopher James Patterson** ♂ Hopewell Junction, N Y (licensed in New York in 1891), aged 78, formerly on the staff of the Hudson River State Hospital, Poughkeepsie, where he died, February 1, of arteriosclerosis and chronic myocarditis

**John Eagleton Ford**, Grand Junction, Colo., Kansas City (Mo.) Hahnemann Medical College, 1906, member of the Colorado State Medical Society, on the staff of St Mary's Hospital, aged 74, died, January 20, of coronary thrombosis

**Irving David Steinhardt**, New York, Columbia University College of Physicians and Surgeons, New York, 1906, aged 64, for many years on the staff of the Mount Sinai Hospital, where he died, February 25, of coronary occlusion

**Joe Bradford Wright** ♂ Lynnville, Tenn., Vanderbilt University School of Medicine, Nashville, 1912, past president of the Giles County Medical Society, served during World War I, aged 54, died, February 3, of coronary thrombosis

**Joseph Martin Knochel** ♂ Lincoln, Ill., Bennett Medical College, Chicago, 1915, served during World War I, formerly member of the city council, aged 53, died, March 21, in St Mary's Hospital, St Louis, of cerebral hemorrhage

**Bayley Burton Bachelder** ♂ Sebastopol, Calif., Hahnemann Medical College of the Pacific, San Francisco, 1914, on the staff of the Sonoma County Hospital, Santa Rosa, aged 63, died, February 23, of coronary thrombosis

**Mary Hance Eccles**, Brooklyn, Woman's Medical College of the New York Infirmary for Women and Children, New York, 1878, aged 91, died, March 17, of arteriosclerosis, chronic myocarditis and coronary thrombosis

**Gertrude Dobson**, Quincy, Mich., Hering Medical College, Chicago, 1909, for many years health officer, formerly member of the school board, aged 81, died, March 5, of valvular heart disease and diabetes mellitus

**Fred Joseph Graham**, Alma, Mich., University of Michigan Department of Medicine and Surgery, Ann Arbor, 1901, member of the Michigan State Medical Society, aged 76, died, March 8, of coronary thrombosis

**John Colton Deal**, Philadelphia, University of Pennsylvania Department of Medicine, Philadelphia, 1897, aged 71, died, March 12, in the Presbyterian Hospital of arteriosclerosis and dissecting aneurysm of the aorta

**John Wesley Browning**, Gary, Okla., Barnes Medical College, St Louis, 1899, member of the Oklahoma State Medical Association, aged 72, died, January 9, of cerebral hemorrhage and arteriosclerosis

**Lorenzo Oscar Smith**, Harlan, Ky., Hospital College of Medicine, Louisville, 1903, for many years member of the staff, served during World War I, aged 63, died, February 1, of coronary thrombosis

Glenn Moomau, Petersburg W Va, College of Physicians and Surgeons Baltimore 1904 member of the West Virginia State Medical Association, aged 61, died recently of coronary occlusion

John Howard Seiple @ Center Square, Pa, University of Pennsylvania Department of Medicine Philadelphia, 1891, aged 73, died, February 13 in Miami, Fla, of cerebral embolism and hypertension

Alva Garfield Dunbar @ Pulaski, N Y, University of Buffalo School of Medicine, 1912, served during World War I, aged 53, died, February 23, of diabetes mellitus and coronary thrombosis

Guy Martin Russell @ Billings, Mont, College of Physicians and Surgeons, Keokuk Iowa, 1898, member of the National Gastroenterological Association, aged 70, died recently of encephalitis

Max Wegman, Newark, N J, Long Island College Hospital, Brooklyn, 1909, served during World War I, aged 58, died, February 3, in Roseland of coronary thrombosis and arteriosclerosis

Samuel Stern @ Atlantic City, N J, Jefferson Medical College of Philadelphia, 1905, served during World War I, aged 63, died, February 18, in the City Hospital of coronary occlusion

Prentiss Leroy Hoot, Monterey, Ind, Bennett College of Eclectic Medicine and Surgery, Chicago, 1890, aged 75, died, March 18, in St Catherine's Hospital, East Chicago, of myocarditis

Lovelace B Capehart, Raleigh, N C Leonard Medical School, Raleigh, 1907, Long Island College Hospital, Brooklyn, 1923, aged 78, died, March 8, in St Agnes Hospital of heart disease

Wilmer J Sell, Crocker Mo, Central Medical College of St Joseph, Mo, 1905, member of the Missouri State Medical Association, aged 74, died, February 2, of lobar pneumonia

Frederick Patrick Reed, Stockton, Calif, University Medical College of Kansas City, Mo, 1899, served during World War I, aged 71, died, February 7, of aortic insufficiency

Anna Carville Hands, Boston, College of Physicians and Surgeons, Boston, 1894, Tufts College Medical School, Boston, 1895, aged 81, died, February 26, of coronary thrombosis

James Marion Smith, Pocatello, Idaho, Iowa Medical College, Des Moines, 1886, Rush Medical College, Chicago, 1888, aged 84, died, February 15, of cerebral hemorrhage

Elmer B Grosvenor, Richmond, Ind, Pulte Medical College, Cincinnati, 1882, formerly president of the board of health of Richmond, aged 80, died, March 12, of myocarditis

Augustus Ives, Grand Ridge, Ill, Bellevue Hospital Medical College, New York, 1878, aged 86, died, March 12, of acute dilatation of the heart and chronic pulmonary emphysema

John Tavner Beale, Lovelock, Nev Missouri Medical College, St Louis, 1876, formerly justice of the peace of Imlay, aged 89, died, February 28, of chronic myocarditis

Thomas M Eade, Champaign, Ill, Rush Medical College Chicago, 1894, aged 69, died, March 12, in the Burnham City Hospital of myocarditis and diabetes mellitus

Edward M Shaffner, Salamanca, N Y, University of Buffalo School of Medicine, 1884, aged 87, died, February 27, of bronchial asthma and edema of the lungs

William Augustus K Chase, St Louis, Barnes Medical College, St Louis 1900, veteran of the Spanish-American War, aged 69, died, February 24, of heart disease

Edith Harris Schad, Bellevue Pa Woman's Medical College of Pennsylvania, Philadelphia, 1890, aged 77, died, February 2, of cardiovascular renal disease

Henry M Meyer, Jupiter, Fla, Homeopathic Medical College of Missouri St Louis, 1888, aged 74, died, February 26, in Lake Worth of heart disease

William Richter, New York, University of the City of New York Medical Department, New York, 1886, aged 77, died February 2 of coronary sclerosis

Lillie Dale Hanley Bates, Long Beach, Calif, State University of Iowa College of Medicine, Iowa City, 1885, aged 84, died February 6, of arteriosclerosis

Norman Grady Williams, Franklin, N C Emory University School of Medicine, Atlanta, Ga, 1917, aged 49 died February 10, of cirrhosis of the liver

William Henry Hersh, Chicago, Harvey Medical College, Chicago, 1902, also a dentist, aged 73, died, March 6, in the Cook County Hospital of pneumonia

Wilfred Gilmour Reive, Welland, Ont, Canada, University of Toronto Faculty of Medicine, 1904, medical officer of health, aged 60, died, January 22

Thomas H Coke, Denver, Tenn, University of Tennessee Medical Department, Nashville, 1901, aged 73, died, February 19 of hypertensor and hemiplegia

Lester A Rhyne, Atlanta, Ga, Georgia College of Eclectic Medicine and Surgery, Atlanta, 1890, aged 74, died, February 21, of chronic nephritis and uremia

Harry Isaac Wiel, San Francisco, Johns Hopkins University School of Medicine, Baltimore, 1905, aged 61, died, February 14, of arteriosclerosis

Josiah U Johnston, Des Moines, Hahnemann Medical College and Hospital, Chicago, 1899, aged 70, died, February 24, of cirrhosis of the liver

William Curtis Stifler @ Baltimore, College of Physicians and Surgeons, Baltimore, 1905, aged 69, died, February 17, of cerebral hemorrhage

Morriss De Witt Kelley, Birmingham, Ala, Louisville (Ky) Medical College 1904, aged 64, died in February of injuries received in a fall

Eugie A Ross, Dlo, Miss, Memphis (Tenn) Hospital Medical College, 1900, aged 64, died, February 27, in Jackson of esophageal varices

Carl L Prichard, Harold, Ky, University of Louisville Medical Department, 1899, aged 71, died, February 21, of cerebral hemorrhage

Charles Hiram Osineup, Colorado Springs, Colo, Baltimore Medical College, 1891, aged 79, died recently of chronic myocardial disease

William George Allen, Chicago, Hahnemann Medical College and Hospital, Chicago, 1910, aged 82, died, February 28, of myocarditis

Dwight Gilbert Hoxie, Hampton, Iowa, Rush Medical College, Chicago, 1893, aged 81, died, February 17, of cerebral hemorrhage

Albion James Howell @ Berkeley, Calif, St Louis University School of Medicine, 1923, aged 45, died recently in San Francisco

Patrick H Brown, Temple, Texas, University of Louisville (Ky) Medical Department, 1892, aged 76, died, January 19

James Walter Mulligan, Fort Coulonge, Que, Canada, McGill University Faculty of Medicine, Montreal, 1905, died recently

George Elliott Chapman, Danville, Ga, Louisville (Ky) Medical College, 1886, aged 76, died, February 9, of heart disease

Maca Gilbert Maker, Fall River, Mass, Baltimore Medical College, 1909, aged 56, died, March 2, in Providence, R I

Allen Reed Taylor, Brodhead, Wis, Milwaukee Medical College, 1899, aged 73, died, February 13, of coronary occlusion

L A Weaver, Rogersville, Ala (licensed in Alabama in 1888), formerly state senator, aged 82, died, February 15

George Franklin Crawford, Tyro, Miss (licensed in Mississippi in 1891), aged 73, died, February 5, of nephritis

Jackson Rhodes, Burbank, Calif, Medical College of Indiana, Indianapolis, 1897, aged 82, died February 12

Ada Barker Luttril, Knoxville, Tenn, Tennessee Medical College, Knoxville, 1907, aged 61 died, January 8

Harry Edgar Cook, New York, Syracuse University College of Medicine, 1898, aged 65, died, January 10

#### DIED IN MILITARY SERVICE

Joseph Antony Ciminera, Waterbury Conn, University of Vermont College of Medicine Burlington 1916, served during World War I was called to active duty Feb 24, 1941 in the National Guard as commanding officer of the medical detachment of the 102d Infantry 43d Division with rank of lieutenant colonel, aged 49, died January 28, at Camp Blanding Fla, of heart disease

## Bureau of Investigation

### PREPOSTEROUS POPPYCOCK FROM HIEL EUGENE CRUM

#### The State of Indiana Catches Up with an Abrams Disciple

One of the strangest and most incredible stories to come to the attention of the Bureau of Investigation is found in the 199-page brief filed by the Indiana State Board of Medical Registration and Examination with the Supreme Court of Indiana, asking that court, in effect, to affirm the action of the Board in revoking the license of one Hiel Eugene Crum to practice chiropractic, naturopathy and electro-therapeutics in Indiana. This revocation was based on the charge of gross immorality in the conduct of his practice, because of the use of a bizarre machine. The story serves merely to illustrate that certain portions of the American public can still be fooled by the tenets of Albert Abrams, while others are sufficiently intelligent to recognize such fakery for what it is.

According to the brief, Crum received a certificate in naturopathy in June 1927. It shows that he graduated from the College of Drugless Physicians and that for his preliminary education he received his common school and high school training in Wilkinson, and that for his professional education he was a student in the College of Drugless Physicians from Sept 14, 1925 to Sept 14, 1926. The certificate of the dean, "Otis J. Briggs, ND," showed that Mr. Crum graduated with the degree of Doctor of Naturopathy from that school on Sept 14, 1926, the same date on which, after a year in that school, he received two other doctorates referred to—Doctor of Chiropractic and Doctor of Electro Therapeutics.

While it would be very interesting to consider here all of the evidence presented in this case, it will be sufficient for our purposes to refer to portions of the testimony of a few witnesses whose names appear above the portions of their testimony presented herewith.

#### W O Hodge

"After we began taking treatments of Crum the members of the staff of the City Hospital wanted her [the patient] to continue treatment at the City Hospital. I advised to let them do what they could and him too but he advised not to go and I couldn't get her to go. She did go back and they wanted to give her X-ray treatments but she refused them because she was depending on Dr. Crum. He told her not to let them have anything more to do with it. He said he could cure her. Her health now is as bad as could be. She had a hemorrhage this morning. She has been in bed for six weeks. Part of her body has decayed and disappeared. You could see her ribs if it was cleaned out. I know. It was almost to her heart. We put pads on it to absorb the stuff in her breast. The other breast is as black as your hat. She is suffering from cancer and was during the time Crum was treating her and said he could cure her and advising her not to go to a doctor. Part of the time she is out of her head so she cannot talk. He gave her different treatments but of the same sort. Sometimes he just rubbed the thumb nail."

Presumably thumbnail rubbing represents the ultimate in nature cure, since it is obvious that if anything is happening to the patient it is by virtue of nature alone.

#### Joseph B. Adler

"Mr. Crum called off a number of different things while pushing his fingers on a little slide. I asked 'What does this mean, doctor?' He says 'When I call to the machine and push my fingers on the slide if it has a rough feeling it indicates trouble. If it has a perfectly smooth feeling it does not.' After he had done that a good many times and he told me it was done by ether. I said 'I feel no sensation of any kind.' I don't see what connection there is. I am not connected with the machine. He says 'It is through the ether that you get the benefit.' I asked, 'What does this cost you?' He answered '\$500.00'."

Where was it made?

"In Chicago."

"How did you learn about it?"

"Went to Chicago."

"How long did it take you to learn?"

"Three months."

#### Carl Stone

"About 1925 I had an attack of what the doctor said was kidney stones. I went to Crum and he worked for about fifteen minutes with his machine and he said I had better let one of the other doctors work on me which was done. They didn't do any good. Finally they sent me to Dr. McAlpin to use the machine. After Dr. McAlpin had worked

with it about thirty minutes he said, 'That machine isn't any good at all. I will get you some medicine.' And he got me some morphine tablets. My son was supposed to have had absent treatments part of the time. When he treated me he would rub the pedal on the side and ask if I felt any better. I would tell him 'No' and he would go through the same performance and ask me again, and I would tell him 'No'. It was rheumatism for instance that he had in mind, he would say 'Rheumatism, rheumatism, rheumatism, rheumatism,' repeating it over and over in that same manner."

Like mumbo-jumbo from deep in the heart of Africa—and also some morphine tablets.

#### Toner Overly

"He pulled the box over to him and started in a chant using these words: 'Kill the bacillus, kill the bacillus, lymph to kidneys, lymph to kidneys, blood to kidneys, blood to kidneys, blood to intestines, electricity to kidneys, electricity to kidneys, kill the bacillus, kill the bacillus poisoning,' and he did that for probably two minutes and turned to me and says, 'Now the poison is killed. All we need to do is tune up your system and get rid of the other difficulties in your system and I think you will be all right.' He said I could come the next Saturday morning and in the meantime he would give me absent treatments on Monday, Tuesday, Wednesday and Friday."

#### Charles C. Shadley

"On the second trip back I told Mr. Crum that I would like to know something about the machine so he started explaining something about the ether and one thing and another. He told me about fertilizing a farm down by Martinsville. He never left the office at all to do it. He told me that he had fertilized the field with the machine and that it produced a good many more bushels per acre afterwards. He also told me about making a demonstration at a dental clinic where he said he filled some man's teeth with the machine so that in ten minutes you couldn't tell the tooth had ever had a cavity in it. Then he told me of some woman that worked in his office after she had been a patient. While she was a patient she made a remark to Mr. Crum about her husband having his finger cut off at the first joint. Says Crum, 'Bring him down and I will grow a new finger on that man.' She brought him 'In ten minutes' time,' said Crum 'that finger had grown out from the first joint there until it even had a new nail started on it.'"

Of course, all this is no more ridiculous than claiming to be able to diagnose and treat disease by the use of this machine, but it is in connection with subjects with which the public is somewhat more familiar and therefore not quite as successful.

In regard to a demonstration of finger-lengthening and shortening:

#### Scott W. Smith

"I watched very carefully and noted that the lengthening of the finger and shortening of it was made by slanting the pencil. 'What are the colored lights for?' I asked. 'If you have one color light that may be kidney trouble. Another color would be some other ailment,' said he."

"'Doctor,' I continued 'you didn't move the thing when you were diagnosing me.' 'Oh,' answered Crum, 'I must have forgotten that.' So he moved the dial along and obtained his original findings."

"He told me he could cure me of infantile paralysis. When I was ready to leave after a 'leg lengthening' treatment he said 'Now if this should slip back you will have to come back for subsequent treatment. I think he meant that when I got out on the street if I found one I was still shorter than the other I should come back for further treatment. So far as I can tell the leg has never changed one bit.'"

#### Now Hiel Eugene Crum for himself

"The school I attended was the College of Drugless Physicians, which also went by the name of Central Scientific College. It later came out in the papers that the institution was closed as a diploma mill. There was a lot that wasn't true about it, but I don't remember the instances. He was fooled by the same outfit that is on me, and all he ever did that was wrong that I know of was to back date a diploma. I think he could still be going now. I went to his school regularly only from September 14th of one year to September of the next year. I got the degrees of Doctor of Naturopathy, Doctor of Chiropractic, Doctor of Herbal Materia Medica, Doctor of Electro Therapeutics, all in one year."

"I don't remember how long it takes to get a degree. Doctor of Herbal Materia Medica. Most of what I got was gotten by going over the stuff that they put out here at Hammond in those herb books. There is a nerve place where they sell herbs. The place has a good reputation among the drugless people."

"In Briggs' school we studied electronics. I have a pamphlet he put out in 1924 that has got it in there. It has got Psycho-Therapy in there and Electro Therapy."

1 For account of revocation of license to practice medicine in this connection see J. A. M. A. 115 (Feb. 21) 1947.

Naturopathy and Chiropractic and Electro Therapeutics and everything else. It has got Biochemistry. [From which one would judge that it was a fair size pamphlet]

I am the inventor of the box that is before me here marked Exhibit 7. I don't think I have used this identical box. I put a transformer in the ones I had. Then there are differences in the boxes. Referring to the box marked Exhibit 8 I have used that box. There is a place in it to carry chemicals. The chemicals I use are Schuessler's [Schuessler's] Biochemical Cell Food.

The way I have reasoned the thing it is in trituration. These chemicals are triturated trillions of times when I get them and are triturated more after I get them and it is a combination between them and whatever organic substance you want to work in with them, but that would make no difference. That is the whole thing.

'The machine would diagnose without the chemical. It wouldn't be of no benefit that I can see without the chemical from the treatment standpoint. The mixture helps in the diagnosis also. You don't have to have it though for the diagnosis but it helps.

'I have treated sarcoma and carcinoma. A sarcoma is a cancerous tumor. I have treated all kinds of diseases that I know the names of, and a lot of them I don't know, I suppose. Wild Welch bacillus is just one of about five thousand foreign bacilli that gets in the colon. It is supposed to come from wild Welch rabbits.'

Q—Isn't this wild Welch rabbit a dish they make up out of cheese and give it that name? It is not an animal at all, isn't that right?

A—Well it got into this country through rabbits is what I understood. It would not necessarily have had to have been wild. I don't know whether wild Welch rabbit means any animal at all or whether they speak of Welch rabbit as a dish made out of cheese and it was once called Welch rarebit. I think I found about wild Welch bacillus in the dictionary.

I got my convictions on the formula I refer to in a dream. I got up one night after I had been thinking about what kind of chemicals I would like to have because I had awakened from a dream where I got the names of a chemical, so I got up and wrote down the list right away. But I did not altogether stick to the list of chemicals I got in a dream.

It is not necessary to talk into the machine, you can think into it.

When I diagnosed the cancer I did not send any section of it to a laboratory to be studied. I diagnosed it by inspection, loss of weight, loss of appetite, general inefficiency, blood disease, blood findings. I guess that is the only way I ever diagnosed a cancer in any case. The only positive proof of the existence of a cancer is to take a section of the growth and examine it under the microscope. You can be sure in a great majority of cases whether they have cancer or not without a microscope. For tuberculosis cases I don't believe I ever had a sputum test made.

We know the death rate for all the germs. We have a death rate for tuberculosis which is 1,045. As to what that means—well I have never tried to find the emanation rate—somebody brighter than myself does that—but I use the rates.

I did not get any information from Dr. Crile that he was using a machine like this. It came through one of his nurses who is an assistant of one of our doctors whom I know very well.

I don't know what these lights are for and the holes. I never use them. The dial is supposed to measure the intensity of the emanations or the amount of disease they have. I don't know whether it is hooked up to anything on the inside. It may be just bolted on the inside and not hooked to anything. The machine doesn't have to be hooked up to a light socket to work. I can't tell you the purpose of a light in it.

The colors don't help in diagnosis but when I am not able to get rid of the pain in any other way, I put it on blue or indigo and the pain leaves. Red gets rid of irritation. For skin disease I put it on turquoise.

And so on ad infinitum.

Even for quickery this is far beyond the beaten path. Time and time again when persons who are engaging in quackery and pseudo-medicine encounter the law, the same witnesses appear in their defense. Edward M. Perdue, whose name has been referred to in these pages in connection with his appearance as a witness for Norman Baker and in other connections, appears in this case. And he does himself proud. For example.

#### Edward M. Perdue

My profession depends on what I am engaged in. I am a lawyer, physician and engineer. In therapeutics I am a graduate in osteopathy. I found when I concluded the publishing of some of my research I had discovered the cause and the biochemistry and the cure of cancer.

I have with me my own translation of works on emanations and oscillations and I have it in Italian. My own translations have gone clear beyond anything done in the United States.

I did not have any desire to come here just to exploit my knowledge. They take me all over the United States because I am a lawyer, engineer and practicing physician.

The color ribbon has little holes in it and above that are different rays or colors of the solar spectrum, all the way from infra-red to ultraviolet.

You can treat patients without putting any specimen like blood, urine or saliva in the machine. [Aha! An improvement on Abrams'—Ed.] That is the justification for treating chickens and cattle. They have just as good a right to get well as we have.

Treatments can be given in the manner in which Dr. Crum treated the brother of a woman who was in his office while the brother was in Ohio. Three years ago my wife was seized with a very serious ailment. She broke out all over her body with a burning sensation. My wife corresponded with Dr. Madge Stephens, of Terre Haute and by correspondence only and the absent treatment she got well. That helped to form my opinion as to whether or not it was proper to cure a person by absent treatment.

I don't know, for I have not investigated, whether this machine could assist in the fertilization of the ground or of the seeds in the ground to the extent that the crop would be more plentiful because of the treatment. The treatment by this machine of animals ought to be just as possible as in human beings.

I do not know the names of any graduates of the Kansas City College of Osteopathy who obtained a license within recent years. I can't give the names of any one who obtained a license in any state in the union upon a basis of reciprocity on the ground he had graduated from the Eclectic Medical University of Kansas City. I became a professor in the medical college five years before I graduated in the same medical college and went to school at the same time. I got the degrees of Bachelor of Science, Bachelor of Arts and Master of Arts from Kansas Normal College. I began going there in 1912, and I think I finished in 1923. No the word should have been 18 that is 1823. But that was before I was born. No, I don't know the dates when I got the degrees. It is true I was teaching in the Hahnemann Medical School in 1895. I got the Master's Degree two or three years after I got my B.A. degree. I got that when I was 23 years old. I got my Master's Degree some time along in 1891 or 1892. I got a license to practice in 24 or 25 but I began practicing in 1900. It was lawful at that time to practice without a license.

I was a personal student of Dr. Albert Abrams. In this book entitled Writings and Translations of Dr. Edward M. Perdue I have some work of Dr. John R. Brinkley. Dr. Brinkley went to school to me. He is the man whose radio

was closed in this country by the government. He was one of these fellows that cured people by the thousands by goat gland treatments. He had some rejuvenation thing by which this ionization to which I referred to could be stopped. He rejuvenated thousands of men and women. There were some articles published in the *Scientific American* about this Abrams to whom I have referred. I suppose he was investigated by the editors of *Hygeia*."

This is a reasonable supposition, in view of the fact that Brinkley unsuccessfully sued the American Medical Association and Dr. Morris Fishbein, editor, for a million dollars because *Hygeia* published a statement to the effect that Brinkley was a quack.

The foregoing excerpts come from the first thirty-six pages of this one hundred and ninety-nine page document, which merely represents the points raised in an appellee's answer brief. Conjecture, then, the total amount of evidence that would appear in the original suit. It hardly seems worth including the statement that on Nov. 3, 1941, the Supreme Court of Indiana upheld the action of the State Board of Medical Registration and Examination in revoking the drugless physician's license of Hiel E. Crum. (See also *THE JOURNAL*, Dec. 6, 1941, p. 1992, and Jan. 24, 1942, p. 322.)

## SOME MISCELLANEOUS MEDICAL FRAUDS

### A Variety of Schemes Debarred from the Mails

Fraud orders issued by the Post Office Department have frequently been the subject of extensive articles by the Bureau of Investigation in these pages of *THE JOURNAL*. Following are brief abstracts of some fraud orders not dealt with previously.

**Joll C. Stockard**—This person was a bartender in a Los Angeles cafe and sometimes used the name Donald K. Eby. Through the Hollywood postoffice he sent out a nostrum known as "Formule 300," representing that it would restore all users to a state of normal youthful vigor and vitality, and that it contained all the vitamins necessary to bring back those powers to all impotent men. Twice in 1941 the Post Office Department ordered Stockard to appear at a hearing and show cause why a fraud order should not be issued against him for making false and fraudulent representations and promises for his nostrum. When the hearing was finally held on July 30, 1941 Stockard did not appear. On this occasion, however, a government chemist and a medical expert testified for the Post Office. According to the chemist the preparation consisted of tablets each chiefly composed of alfalfa with 0.883 grain of sodium carbonate, 0.0015 [grain] of organically combined iodine, 0.064 grain of total alkaloids including those of lobelia, and traces of capsicum, sugar and tale. No yeast was found although the label on the bottle declared that each tablet contained 4 grains of live yeast. The expert medical witness discussed at this hearing the causes and scientific treatment of impotence and showed that Stockard's mixture did not contain all of the elements and vitamins necessary for the successful treatment of that condition and hence would not restore normal youthful vigor to impotent men. Accordingly Stockard was barred from the mails by a fraud order issued on Sept. 30, 1941 which also covered the numbers of the two postoffice boxes that he had used in Hollywood.

**Terminal Products Company**—Under this trade style one Andrew Portnow of New York sold an elastic abdominal belt through the mails under representations which the Post Office Department declared to be false and fraudulent. Among these were that the device when worn by any obese person, would, within a "few days" reduce the waist line of the wearer and remove all excess abdominal fat and would restore "pep" to any user and strengthen weakened abdominal muscles. The manufacturer denied these charges through his attorney. When the case came to a hearing it was shown that the belt in question was made of latex thread and that the part which encircled the abdomen was approximately eight inches in width and had what may be termed a two-way stretch. The pouch was of similar material but the understraps had only a vertical stretch. At the hearing expert medical witnesses testified for the government that obesity may be of two types, one of which involves glandular dysfunction and the other is the result of dietary indiscretions and lack of exercise. Thus every case of obesity should be studied and treated according to its causes. The witnesses went on to show that they had observed many cases of obese persons who wore belts similar to the one in question and in no instance was there noticed a weight reduction which could be in any way attributed to the wearing of the belt. In attempting to refute this evidence Portnow presented two affidavits alleged to have been executed by regular practicing physicians in the city of New York. These stated that the writers had examined the belt and that in their opinion it would have a massaging effect on the abdomen which would tend to reduce local obesity, improve the posture and alleviate certain symptoms such as shortness of breath. This testimony, however, was discounted since the persons quoted were not present to be cross examined nor was it shown that either of them ever had treated obesity or actually used or observed the belt in question or one substantially similar thereto. On March 17, 1941 a fraud order was issued against the Terminal Products Company and its officers and agents.

## Council on Medical Education and Hospitals

### ANNUAL CONGRESS ON MEDICAL EDUCATION AND LICENSURE

*Thirty-Eighth Annual Meeting, Held in Chicago, Feb. 16 and 17, 1942*

DR. RAY LYMAN WILBUR, Stanford University, Calif.,  
Presiding

### COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

FEBRUARY 16—MORNING

#### Medical Care of Civilian Population During War

DR. RAY LYMAN WILBUR, Stanford University, Calif. War, from the selection of the soldier down to his return to his home after war, compels the very best of medical service. Physicians who join the services are dislocated from their normal environment and they must learn new techniques and new mass procedures in order to get properly done the large amount of medical work required. We need think only of the blood bank to realize what differences in procedure there are between now and the Spanish American War or even the first World War. The skills to be learned by the physician are more intricate, more precise and more effective than ever before. The call for good medical care is of primary importance. We must take it for granted as we build up a larger army and navy that there will be a heavy draft on members of the medical profession between the ages of 30 and 50. This compels us to face the question how we are to supply our civilian population with medical protection. Dependence on the physician and the quality of his work, particularly when the man of the household is in war service, is essential if we are to have a population that holds steady in the face of discouragement and even of disaster.

There is no easy way to multiply rapidly the number of well trained doctors and nurses. The training of the physician must be complete enough so that on graduation and at the end of the intern year he may face with assurance the most difficult medical problems. The greatest responsibility may come in his very first case following some emergency. We can shorten the number of calendar years involved by continuing his training during the so-called vacation period. There is no cheap and quick way to turn out first class physicians. This applies also for nurses. Our principal civilian problem will be to save the time of the trained physicians retained at home so that, in spite of reduced numbers, they can give satisfactory scientific care. There is real danger if we accept an inferior sort of medical attention. The various cultists, with their cheaper training, will not be used to any extent in meeting the emergencies of war. If we permit them to take over in any way the care of a considerable part of our civilian population we are going to pay a heavy price. Epidemics are a normal part of war. We have only to think of the encephalitis cases that distributed themselves over the world following the last war to sense what will come as we send soldiers and sailors over every sea and into jungles and swamps in many parts of the world. Only careful training makes it possible to make the early diagnoses, many of them based on chemical tests and the use of the microscope. If the symptom treaters are used to any great extent during war time we must expect disturbances of civilian morale. The cultist who manipulates an individual for his backache may not recognize it as one of the early symptoms of smallpox and is therefore apt to speed the disease. Ignorance is our greatest enemy in the care and protection of the human body.

If we are to meet the obligations that the community owes to citizens during war time we must continue all the important social activities in which the physician has now taken an important part such as the control of nutrition and the protection of the minds of our youth and of those who are in the strained conditions of warfare. More physicians are

does not give the clue to those innate and essential capacities of men on which we call to an unusual degree in war time. The standards of the draft boards are, of course artificial and are the best screen for sorting out individuals that we have at the moment. None of these tests as yet give us a judgment on what I have designated as fitness. To maintain this capacity to do and to resist strains is the supreme task in the background in all our plans for medical care as a part of civilian defense. Those left at home must be kept fit and must possess that courage which comes with the glow of health.

In rearranging the medical care in any community after a severe draft of physicians from it, we must build on the medical institutions in existence or provide for new ones. We must extend the functions of all organized health departments. It is inevitable that there will be an extension of relief which must be used wisely. Obstetric care must be given a primary place in all planning for the civilian population. Whatever is done must be in tune with experience over the centuries in the care of the sick by the medical profession. There will be an increased use of the hospital and various forms of hospital care must be provided through hospital insurance or other ways. About each hospital there must be grouped the doctors and nurses of the community so that their time can be put to the greatest use. Clinical centers around groups of physicians will also be needed in some places. The indigent sick will require that care which they receive in normal times, but many of the facilities now used for the indigent sick will have to be used for those who normally would care for themselves in some other way.

New methods of convalescent care must be developed. Men returning from service wounded or ill should be given the best of attention. No doubt resort hotels can be used for this purpose. Convalescent patients and the chronically ill will have to be moved promptly out of the hospital centers so that the acute ailments can be handled. There will be a proportionate increase in the number of epileptic, incompetent and alcoholic persons in the peace time population. Every one should have hospital care available to him in every community. Doctors and nurses should be available at all hours. Patients are to be transported to doctors, and not doctors to patients. The California Physicians' Service, with its six thousand doctors, has indicated a procedure by which the medical profession can tackle these responsibilities of medical care. The Farm Security Administration, which is handling over one hundred thousand families and more than a half million persons, has shown what organized medicine can do in marginal rural areas. Experiments in Michigan and elsewhere show that medical care can be handled by and through the profession, if the will to do it is at hand.

While the leadership must come from the doctor, others must join in developing administrative mechanisms that will be sound and effective. There will have to be built up about each hospital a personnel that can be trained to substitute wherever possible for the laboratory workers, the nurse or the doctor. Many women will need to be brought into these auxiliaries to hospitals and, wherever it can be done, the nurse and the doctor should perform only those things that require the expert.

Many undesirables are left on the hands of the community in times of war. We shall not do a complete job unless adequate measures are taken to control the spread of venereal diseases, unless the forces back of the prostitute are brought under full control and unless the distribution of alcohol is put on a basis far different from that of the wholesale social abuse which is evident today. With terrific enemies abroad we have at home termites that are boring into the foundations on which youth must depend. Wholesome living is required if we are to meet Spartan enemies capable of any sacrifice. A steady flow of well trained doctors and nurses must be maintained. We must see that premedical students are discovered, helped and educated in medical schools of high standards. The hospital can become such a center as it has never been before in educating the population in the scientific care of the human body and the scientific protections of society. The newer procedures of education made possible by the motion picture and the radio can be used to build up sound ideas of the human body that will help win the war. Each community must face

its own health and other difficulties. Only through tens of thousands of well organized local communities unafraid and willing can we save our democracy in this war. Each community must stand on its own feet, organize its own facilities and provide its share of the common defense. To do this, medical care is requisite and must take promptly such new forms as conditions demand.

### The Relationship of the Chemist to Medicine

VINCENT DU VIGNEAUX, PH.D., New York. The relation of the chemist to medicine is an involved question. All has not been well between the professional groups representing the chemist and the clinical man. The goal is to bring the groups representing chemistry and medicine to work together for the common good. We must think of the problem from the point of view of the field of medicine in its power to relieve suffering. The chemist has as real an obligation toward this end as the clinician himself but in accomplishing this goal the chemist must function through the clinician and through the field of medicine. It is the obligation of medicine to use to the fullest extent what specialized techniques the chemical discipline can offer and what the chemist can accomplish. At present the full power of chemistry and the chemist in medicine is not fully utilized.

The board of directors of the American Chemical Society became disturbed at the turn of events when chemists and clinical pathologists became involved over their prerogatives in the clinical laboratory. It foresaw that a wider gulf might develop between these fields which would be reflected in a retardation of the development of medicine and with a consequent injury to the public. I was charged by the chairman of the board of directors to select a committee to study this problem, to try to bring the American Chemical Society and the American Medical Association to work together and to make recommendations to the board of directors so that these ends might be accomplished. The committee became known as "The Committee on Chemical Service to Medicine." Chemistry as a profession is independent and of equal rank with other learned professions, but in this particular connection chemistry is functioning in a service capacity to the medical profession. Recognition of this by chemists is in reality a mark of strength and confidence and it does not detract from the standing of chemistry as an independent profession in its own sphere. It was felt best not to have any one on the committee who might be immediately affected by decisions of the committee. The members of the committee were Dr. Donald D. Van Slyke of the Rockefeller Institute for Medical Research, Prof. Hans T. Clarke of the Columbia University College of Physicians and Surgeons, Prof. Victor C. Myers of the Western Reserve University School of Medicine, Dr. Arnold E. Osterberg, head of clinical biochemistry of the Mayo Clinic and Dr. W. G. Karr of the University of Pennsylvania, consulting biochemist to the Abington Memorial Hospital and the Philadelphia General Hospital.

One of the main issues at the outset of our study was the claim by some that the mere determination of a constituent of the body fluid or tissue was the practice of medicine. This is a fundamental point. It seemed to the committee that the determination of the constituents of the body tissues or fluids was not the practice of medicine, that one should be able to make a clear differentiation between technique and interpretation. We felt that the chemical analysis in itself cannot be regarded as the practice of medicine. It is chemistry—chemistry employed in the service of medicine. The actual interpretation of the result and application in diagnosis and treatment however, was clearly the practice of medicine.

It was clearly seen that the chemist's responsibility began with the reception of the labeled sample for analysis and ended with his report of the factual data obtained from that analysis to the physician. To obtain the sample from the patient and to interpret the data for diagnosis, prognosis and treatment of an individual patient are definitely the function and responsibility of the medical profession and should in no way be assumed by the chemist. A chemist may collect a sample from a patient only on direct authorization of the physician. The chemist must not attempt to interpret the data in their direct application to the patient. The character of the information

which the clinical biochemist may offer to the physician from his knowledge of the voluminous literature of clinical chemistry should always be abstract, a combination of a perusal of the literature integrated with basic biochemical information. It thus should always be informative but never specifically diagnostic. Our committee feels that a chemist must respect this in his relation with the medical profession and should never transgress this line. However, the chemical profession should be encouraged to assume the responsibility for the standards of the actual chemical work done in the clinical laboratory.

Another basic point which the committee felt must be established was that no barrier should be set up between the clinical biochemist and the clinician. The chemist recognizes the service which a clinical pathologist can render as consultant when needed, but the chemist feels that the clinical pathologist's role as an intermediary must not be an obligatory part of a system of regular clinical practice but rather that he should be a consultant called in only at the discretion of the physician in charge of the patient. The patient should not be required to pay for the services of a clinical pathologist if the attending physician who has requested the analytic data feels capable of making the diagnostic interpretation himself from the data. The chemist feels that there should be no restriction placed on a competent clinical biochemist in his function of accepting material from and reporting the factual data directly to the practicing physician. Where such restrictions have already been imposed, we would urge the medical profession for the good of medicine to try to have these restrictions removed and take advantage directly and fully of chemical aid. Of course, if the chemical profession demands these rights, it has an obligation to the medical profession and to the public to see to it that the chemical work is of high quality. Furthermore, the chemical profession must see that chemists do not usurp privileges and duties of the medical profession. A dangerous situation can arise if the patient can go directly to a chemist for analytic data to be used in self diagnosis.

If the medical and chemical professions can join in an effort to improve standards of clinical chemical laboratory work, the American Chemical Society is prepared to work out a system of certification for clinical biochemists, i. e. chemists who devote the major part of their time to the application of chemistry to the service of clinical medicine. Certification will undoubtedly aid in elevating the profession of clinical biochemistry and set a standard of service to the medical profession. Certification must rest on competence and training. The committee is prepared to recommend to the board of directors of the American Chemical Society that a biochemist with a Ph.D. degree or its equivalent with at least an additional year's training in a hospital laboratory would qualify as a clinical biochemist. The exact statement of the qualifications is open to further deliberation. It might be necessary in addition to have certification in another classification of a group with less training. These might be college graduates with a background of organic, physical, qualitative and quantitative analytic chemistry. They ought to have at least one year of training in a clinical laboratory under the direction of a clinical biochemist whose training I have outlined. It would be preferable not to call these individuals technicians but to call them assistant clinical biochemists.

There is a third problem whether, in a clinical laboratory where other work in addition to chemical work is done, a clinical biochemist judged of qualified scientific and administrative caliber might become the director. Our committee feels that a question of directorship should rest on competence and not a particular degree or on what subject is represented. A director may have under him men engaged in work in which he himself is not versed, but he may have the ability nevertheless to judge quality and thoroughness and accuracy of work. We believe that a clinical biochemist who through years of contact has learned to appreciate the problems involved in a clinical laboratory and who has the necessary administrative ability which would fit him for a director of a laboratory should be eligible for the directorship. The number of cases in practice would perhaps be relatively few. Yet it is an important point in principle. If the medical world offers nothing but secondary positions it will get nothing but secondary chemists, except in unusual cases resulting from fortuitous cir-

cumstances. The committee has been busy for two years quietly working to effect a satisfactory solution of these questions.

A still greater problem is the full utilization of the chemist in clinical investigation. Medicine should encourage competent chemists with initiative, originality and ability, albeit without a medical background, to participate in clinical investigations with proper clinical collaboration. It is extremely difficult for one man in these days to bridge the gap between medicine and chemistry in an attempt to apply both disciplines to the study of disease. There are individual clinicians capable of doing this and such men are indeed desirable, but we must have more instances of the chemist with the intensive training in chemistry meeting with the clinical man in frank collaboration. An intellectual attitude which properly evaluates the position of medicine as well as chemistry is needed before complete understanding and harmony can be achieved. Each field of science has its own methods. Nevertheless, each field receives help from the more advanced and exact fields. The physicist looks toward the mathematician for aid, the chemist toward the physicist and so on. The medical man must look toward other fields for guidance in development of new concepts and methods and must, on the other hand, pass on the fruits of his endeavor to other fields. When such a mental attitude of mutual respect and intellectual humility is accepted by workers in interrelated fields, then true harmony will prevail.

### Professional Education

RUFUS C. HARRIS, LL.D., New Orleans. The chief role of the professional man in earlier times was that of stabilizing custom and of serving the past. His modern counterpart today is bound more closely to the moving front edge of man's current experience. Education for a profession suggests methods by which a person studies one course of life and action, requiring cumulative knowledge of meaning, values and data the understanding of which is essential to individual progress and intelligent living. Such study enlarges experience, which is educative to the degree that it rests on a continuity of a significant knowledge, and to the degree that this knowledge modifies the learner's outlook, attitude and skill. It must have longitudinal and lateral dimensions. It must be historical and social, orderly and dynamic. As successive generations faced the task of getting the world's work done, many things have been found requiring special skills. As the structure of society became more intricate and the technology which it employed more elaborate, natural aptitude for special tasks, and self-training by the trial and error method, were not enough to supply the requisite degree of skill in the necessary number of persons. Professional and trade schools have come into being by the choosing of a few of each generation to devote all their time to imparting the requisite skill to the generation following.

The problems of professional education are thrown into a practical perspective by grouping them under the two great aims of all such training. One aim is to impart to the coming generation of practitioners the existing fund of professional knowledge and skill in an effective way. The other aim is to renew the fund of knowledge to be imparted by adding to it the new that makes for greater professional skill and by sloughing off what has lost its utility. As to the aim first mentioned, it is the teacher's place to stand between successive generations of men and pass to the coming generation the body of professional knowledge and skill which made the passing generation in that profession most useful in doing the work of the whole social group. Coming to the other aim, namely the improvement of the fund of professional skill, it must be handed on from generation to generation, the striking fact is that in the art of the practitioner of any profession, change, though slow, is constant. Modes of thought, shift, population changes, customs and manners drift, life is altered, business relations take new forms and social questions present new shapes. The practice of the profession is conditioned by this general flux. There is always, therefore, the problem of renewing the fund of professional skill which is to be handed on by adding the new and discarding the useless. As changes eat into the frame of professional knowledge its center gradually shifts and the learning which we are to transmit must also shift. The professional ability is the constant object of professional education.

tion It is from this standpoint if any that a vital relation appears between productive scholarship in medicine and medical education Knowing what of the old to discard and finding the new to add requires confident thorough scholarship on a comprehensive scale if the lag between the changes in training and those in practice is not to become so great as to be seriously wasteful

The major load of renewing our fund of professional skill must be shouldered by the professional schools Just as our university science departments, in addition to teaching students have borne the major load of scientific research, so the work of the university professional schools must be organized in order that the schools may carry a larger part of the research so necessary for professional education The difficulty is that the teaching and other loads of these preceptors is so heavy that seldom can they, unless they have exceptional mental ability and physical strength, do more than occasional pieces of semithorough research without paying in loss of health One of the outstanding and challenging facts in the history of professional education since it was undertaken by our universities has been the adherence to a policy of giving such teachers instructional loads which exhaust substantially all their time and strength This policy is a tradition of the earlier period of professional apprenticeship It puts almost the whole emphasis on merely teaching what the passing generation knows Back of it is an assumption which ignores the task of adding to our fund of knowledge as one of the chief functions of professional education A proper possession then of what may be called a vision of research in professional education constitutes professional education's greatest opportunity and most vital need Means must be found in our university professional schools for giving to those who teach the necessary time in which to do it Moreover, some of the undergraduate students can do worthwhile work Such students are growing in numbers This is probably the most hopeful development in professional education today More and more of them are persons capable of making valuable contributions to our fund of knowledge, and one of the most important questions with which any professional faculty can busy itself is to determine how further to increase the number and quality of such students and how to make their work of maximum value

The line which divides the trade school and the professional school may become in these times of crises dangerously vague and indistinct, but the differences in attitude and purpose must be significant I do not believe that we must sacrifice education to win the war It is one of our most important objects of the war It is one of our best defenses If the stream of our civilization is not to become dried up at its source, the professional schools must treasure and convey the wisdom of the past to the coming generations, who may thereby have an orderly understanding of life as an environment in which to find personal happiness as well as material success To do so they must hold in their ranks and put to better use those minds which are capable of discovering, reorganizing and assaying the trends and aims in nature and in human society The chief task is that of advancing science and history No claim is made that an entire science, university or department of a university should be placed behind an effort to effect any given single change in the economic or political structure of our culture Hypotheses are an indispensable part of good teaching and research A good scientist has a point of view He holds it subject to constant correction, but without a point of view he is no scientist and as a teacher he becomes simply a walking equivalent of a second rate encyclopedia or a colorless textbook A prevalent protest of alert students is that the immediacies of facts and data tend to operate in the university classroom as a monopolizing concern, shutting off the listener from the ripe wisdom of the mature teacher It is the boast of some professors that they handle controversial subjects in the classroom in such a skilful manner that the students are never able to know what the professor himself really thinks about the problem This amounts to sabotaging the inner meaning of education No university of course should have a staff all the members of which think alike on a given problem But the blurring of explicit statement of sharp and divergent hypotheses within a faculty is almost as

dangerous There have been handed down to this generation few institutions more precious than the universities with their schools for professional education whose abounding vitalities are attested by their extraordinary longevity, a fact which is in its turn witness to their success in satisfying many of the noblest and most insistent of human desires Only an utterly phlegmatic imagination could fail to sense the power of such institutions of our day to serve as no other agency can serve a way of life which needs the refining and spiritualizing forces which lie at their command

A prevalent mood today is a sense of helplessness in the face of the too bigness of the issues we confront This is no new experience for human beings, however wistfully we may regard the quiet continuities of earlier periods Prof J B Shotwell a short time ago characterized "the anarchy we are living in today" as "the most dangerous since the fall of Rome" Ours is a world of division of labor and specialization Each of us works, whether as scientist or business man, on a narrow sector This itself enhances our sense of helplessness, because whatever we do we feel ultimately coerced by larger forces not controllable within our immediate area of personal concentration Herein lies one source of the sense of ultimate futility that haunts our private worlds The point which all this suggests is the bringing over into professional training more of liberal arts tradition The complexities of modern living require of the physician or surgeon broader educational bases and experiences and wider social awareness than former periods permitted An appraisal of modern man leads to rather desolate and shapeless confusion unless one is able to perceive the general pattern which the process of living is taking The profession whose members are able to balance comprehensive perspective with methodical analysis of detail, who are able to serve and promote the effort to establish the long view out of objective consideration of the forces which affect life in our day, will find its place secure in whatever may be prescribed for existence in an uncertain world

#### The Effect of the War on Medical Education in Canada

DR JONATHAN C MEAKINS, Montreal It is hard for me to shed the cynicism produced by the ten years that my country has been at war in the forty years of my adult life War cut across my college days, then the years of my early manhood and now in the twilight years of my academic life I am thrown back again into war—war of a savagery compared to which the campaigns of the great Mongols pale into insignificance This same comparison has influenced our students as nothing else could do Its influence goes back even to the high school

In 1914-1918 the army was the dominant service in our country To these forces went the man of mature years and strength There have arisen with us since those days the navy and the air force, which have rivaled the domination of the army and have appealed to our youth with an almost overwhelming urge In 1939 we had little of either Today the destroyer, torpedo boat and corvette are manned by youths The fighter, power diver, reconnaissance and bomber planes are the realm of the young These are all of their generation

I can speak only of my own college, which is representative of the young people of this continent The unanimity of their beliefs and ideals is surprising This did not originate during their medical course alone but antedated it The adventurous student to whom the practice of medicine seemed to offer more action than did other professions, turned his eyes toward greater and more immediate adventure This was an unconscious act inspired by those ideals and angers The number of queries received from young men who have contemplated a medical career and the searchings of heart of freshmen and sophomores as to whether their duty does not lie with the combatant forces leaves little doubt that these ideals have shaped and will shape the destinies of many who would otherwise be leaders in our profession I do not imply that the

standard of medical students is any lower than before the war but that a certain element with the capacity of leadership may have been reduced

In May, last year, it was rumored in the press that the Canadian forces would soon be in need of many additional medical officers. To date no authoritative statement has been made to this effect. A poll of our first three years was answered by 81 per cent, and all but three, including the women, pledged themselves to join the armed forces at the completion of their medical training. Such a deep feeling of national obligation cannot help but breed and foster an unrest which is not conducive to concentration toward the acquisition of knowledge for such an exacting profession. This distraction has been increased by requiring the preclinical students to fulfil one hundred and ten hours of basic military training during the academic session. This represents six hours drill a week for eighteen weeks. All these factors have had an influence on the students.

What measures have been taken in Canada to produce more medical graduates? Increased production can be accomplished only by enlarging our classes. By this means in 1946 the first increase will be harvested. This, many will say, will be too late. The alternative is to force our present crop to maturity at an earlier date by running four terms a calendar year for three years instead of three terms for four years. Can a medical course be compared to an assembly line which is limited in the last analysis by the speed at which a man can screw tight a nut to its bolt? Can the human brain be so geared? I doubt it. There are other considerations. Certain courses in the curriculum can best be given at certain times of the year. Have we in Canada a dire necessity for an increased number of doctors and if so how far will one additional graduating class relieve this demand? It has been estimated that 30 per cent of our profession could be withdrawn from civilian life for the armed forces if they were implemented with any degree of uniformity. There are about eleven thousand practicing doctors in Canada, 30 per cent would represent three thousand three hundred available for active service. In Canada there are about four hundred and fifty graduates a year, of whom about four hundred are physically fit males. If before 1945 we graduate one additional class—and that is all we can do by acceleration—this would at most be enough for an additional sixty thousand troops in the different services. But this maximum would have to be implemented by compulsory selective service, which at present is not the law of our country.

These problems have agitated medical education in Canada. The curriculums of the nine medical colleges do not follow a common pattern. Each has its own individuality. McGill decided in 1936 to lengthen the session to thirty-six weeks, exclusive of examinations, from thirty weeks per session, consequently in 1940 we graduated two classes. Our session now runs practically from Labor Day to the third week in June. Other medical schools can do the same without disrupting their excellence of instruction.

There comes the question of the teaching staff. The full time staffs of anatomy, physiology, biochemistry and pharmacology are not as a rule much disturbed by present conditions. The part time teachers have, however, been sadly depleted in the departments of pathology and bacteriology, and particularly in the clinical subjects. The last are hard pressed from three directions. On the average the staffs of all the teaching hospitals of medical schools have suffered or will suffer depletion to a dangerous extent. This is not a static condition but will progress irregularly as time passes. This has placed to an increasing degree an additional burden on the older members of the hospital staff in matters of private practice, hospital duties and additional teaching hours. They differ, therefore, from the general run of practitioners who have but an increased private practice to consider. The vagaries of this depletion bring queer results. It might be expected that general practitioners, internists, surgeons, orthopedists, roentgenologists and pathologists would have enlisted, but the wholesale enlistment of obstetricians and gynecologists leaves one aghast, particularly as they seem to have a passion for the navy.

And so it goes in an ascending spiral of endeavor and sacrifice, which, however, must not be allowed to plunge medical

education into a vicious circle of overworked students and teaching weary staff. If acceleration is the solution, then let us slough off the frills but hold fast to first principles, so that our teaching will be well and truly done, and let us see to it that the medical students, the public and the men in arms will not upbraid us for being faithless to our trust.

FEBRUARY 16—AFTERNOON

### Current Medical Personnel Problems of the Army

COL GEORGE F LULL, M C, U S Army, Washington, D C. The following will give an idea of what officer personnel is required for the Medical Department for the year 1942. Medical Corps 23,658 (this figure includes personnel for professional units for theater of operations for 1942 augmentation only), Dental Corps 5,309, Veterinary Corps 1,015, Sanitary Corps 498, Medical Administrative Corps 2,310. At present there are on duty in the Medical Corps 11,790, Dental Corps 3,306, Veterinary Corps 731, Sanitary Corps 235, Medical Administrative Corps 1,478. The majority of these officers are reserve officers on extended active duty. The question arises as to where these officers are to be obtained. With five thousand graduates each year, there should be at least three thousand qualified for military duty. If the average age is 26, then in the age group 27 to 36 there should be thirty thousand available.

All requests for commissions should be addressed to the Procurement and Assignment Service. Medical students of the third and fourth year classes are allowed to apply for commissions in the Medical Administrative Corps and, when commissioned, will not be called until they have completed a one year internship. The Surgeon General has recommended that this privilege be extended to the members of the first and second year classes and to all bona fide matriculants.

When a man becomes an army officer, he enters a new profession. Line officers, in 90 per cent of instances, take up new careers, entirely different from their civil occupations. There are many assignments which have to be filled by medical officers and which are dissimilar from the duties performed by them in civil life. Infantry regiments have eight medical officers in many instances. Unless the senior officer trains his men, he will have dissatisfaction now and will fall down in combat. It is highly important to train medical officers and men with tactical units prior to combat, as the prompt treatment and early evacuation of the wounded are the greatest factors in the conservation of manpower. We have had one of the lowest sick records in history.

Two years ago the Secretary of War authorized the formation of hospital units which would be called out in case of war. These units consisted of general hospitals, evacuation hospitals and surgical hospitals. They were sponsored by civil hospitals and medical colleges. Some of these units have already been called out and are en route to distant points. With the ranks of American medicine so greatly improved since the last war, I can see no reason why we cannot commission the number required from volunteers. It would be a reflection on us if we had to resort to legislative action. When the armistice was signed in 1918 there were about thirty one thousand doctors in the army, and I am sure that we are going to repeat our performance in this war.

### Medical Education from the Standpoint of the Navy Medical Corps

REAR ADMIRAL ROSS T MCINTIRE, M C, U S Navy, Washington, D C. The navy has a great stake in medical education in this country. The Bureau of Medicine and Surgery has presented a plan to the Secretary of the Navy, which he has approved. It is now possible for those premedical students who have been accepted for entrance and all medical students in accredited medical colleges to be appointed in the United States Naval Reserve in class H-V(P), provided they meet the physical and other requirements. Such students would not be nominated for active duty until after they have completed their prescribed medical studies and shall have been accepted as acting assistant surgeons of the navy for intern training. They have served one year's internship in a civilian hospital accredited for intern training.

It is my belief that a routine college course, as such, is of doubtful value to the future of a doctor. True, it does lay down groundwork for cultural education and consequent broadening as the young man goes on in life. Let us now consider the age factor. The average boy graduates from high school at 18, spends four years in college, four years in medicine and one to two years in internship and is then 27 or 28 years of age. During this time he has had to secure from \$700 to \$1,000 a year to finance his education. Too often the applicants for entrance to medical college do not come from the right sections of our American life. Too many select medicine because it is a respected profession and seems to be a way to make an easy livelihood. It is a business to some and not a profession. We should be extremely careful in selecting students to see that this type does not get into medical school. I should like to present the thought of standardizing premedical education so that at any accredited medical college the academic and medical courses could be completed in six years. This would bring the medical student into a position where he could practice medicine at the age of 26. It would mean much to the navy, as we are now getting officers who are a year or so older than their line running mates. We have a plan whereby all reserve officers are given proper rank as far as age is concerned. When officers and men live on board ship in close contact, to have a man years senior in age and junior rank to those above him is never good.

I should like to see greater emphasis on instruction in preventive medicine. The army and the navy are being impeded by other organizations, such as the National Osteopathic Association, for permission for graduates of their schools to take examinations for entrance into the Medical Corps. One main objection that we have presented to them, after inspection of one of their best schools, is that they do not approach disease from the preventive standpoint. All our schools could improve their teaching in the field of preventive medicine.

In every accredited school we should have a department of tropical diseases. Tropical diseases are appearing in every section of the United States. Industrial hygiene should be taught in every one of our schools. I should like to see military and naval medicine have a more prominent place in the curriculum of all our institutions.

It is our considered thought that every man in this country should at some time give one year of his life to his government. This applies definitely to the boy who is going to study medicine. When a boy reaches let us say 18 he should be called on to decide as to when he would care to give this year of service, having to do this before he is 28. I leave this thought with you. It would be a splendid morale-building method and would do untold good to the nation and to the individual.

The Navy Medical Corps does not encourage specialization until the medical officer has had an opportunity to become well grounded in medicine and surgery. We have found, on numerous occasions, that young men coming into the service who have had nothing but special residency courses following graduation and internship, covering a period of from three to five years, when sent on independent duty turned out to be poor doctors. Had these boys been given an opportunity to see a lot of patients in general practice they would be better surgeons, better pathologists today.

The need for young doctors in the Medical Corps of the Navy will average three hundred each year. This will hold good for the next five years. We base our needs on a ratio of 65 doctors for every thousand of personnel. At the present time we have on duty some thirty-one hundred medical officers. Great numbers must not be taken into the regular service at any one time, unless forced by abnormal conditions. The Navy, however, can assist in training interns far beyond its own normal needs and will be glad to do so. It will be necessary in my opinion for the medical schools to double their output during the coming five years. I believe, however, that the courses now given should not be curtailed in any way, as it is extremely necessary that graduates be well grounded. In the field of aviation medicine it is our experience that the average medical officer has not had enough mathematical background to be able to carry on the research that we find necessary in the study of the atmosphere. Unless the doctor is able to direct and evaluate the studies in atmospheric hygiene much time is

lost and the practical side of aviation suffers. We should give undergraduates a good understanding of what aviation medicine amounts to but make them understand that it should not be specialized in until a thorough groundwork has been laid down by them in general medical and surgical principles. The Medical Department of the Navy is extremely grateful to the medical profession for the continued help that is being given, and in return the Navy wishes to do all it can to help in your problems.

#### Wartime Problems of the Public Health Service

SURGEON THOMAS PARRAN, U S Public Health Service, Washington D C. This article appeared in full in THE JOURNAL, March 28, page 1033.

#### Selective Service and Medical Students

COL LEONARD G ROWNTREE M C, U S Army, Washington, D C. The function of Selective Service is the procurement of man power for the Army. Selective Service has always been sympathetic to your needs. In my early days in Washington we had many conferences on what to do with medical students. It was the general feeling that this problem could best be solved by taking medical students into the Army and Navy reserve corps. The crucial steps in the program were as follows. First, General Hershey defined clearly the responsibilities of the local boards and indicated their authority in the matter. Next pertinent statistics were collected from the American Medical Association, the Army, the Navy and the United States Public Health Service concerning the need for doctors. These figures seemed to carry no weight at first, but there soon appeared an inspired statement from the Office of Production Management on March 4 of last year to the effect that there existed an overall shortage of doctors and that the supply of medical students not only should be maintained but should be encouraged to grow. On May 2 General Hershey's memorandum to all state directors indicated that "there are no replacements for medical students who are withdrawn from school." To this point the American Medical Association and Selective Service carried the ball. Dr Rappleye reports that of the twenty-two thousand medical students handled by Selective Service there were only three with just causes for complaint. This really constitutes a goal. The Navy created the ensign reserve, which took care of third and fourth year medical students and first year interns. Later this opportunity of applying for a commission with the Navy was extended to all medical students. The privilege was extended of commission to all as Ensigns HV(P), United States Naval Reserve. The Army opened up its Medical Administrative Corps for the commissioning of third and fourth year students and first year interns.

When I left Washington the situation was as follows. Bona fide premedical first and second year medical students were being deferred by Selective Service. Students were advised to apply for commissions in the Ensign Reserve of the Navy, and third and fourth year students and interns to apply to the medical administrative corps of the Army for commission. Second year residents were left to their institutions for certification as to essentiality.

The need is for an all out effort. Colonel Lull has just informed us that the need for officer personnel for the Army Medical Corps for this year is 23,658. He explained that the medical corps figure includes personnel for professional units for theater of operations for 1942 augmentation only. During the last war we had 3,673,888 men under arms and some 30,591 officers in the Medical Corps of the Army.

A communication from the War Department dated February 11 has just come to hand stating that the privilege of applying for commissions in the Medical Administrative Corps is to be extended to first and second year medical students and bona fide accepted matriculants at approved medical schools within the United States. May I, representing Selective Service, after a year's cooperation with you and with the American Medical Association, venture to suggest that 1. The present committee Drs Rappleye, Burwell, Diehl and William Pepper, continue to work closely with the Army and the Navy as they have in the past with Selective Service. This committee was appointed by the Association of Medical Colleges. It has proved its worth. 2. Let the Army and the Navy carry the ball for

you 3 Adhere strictly to cooperation Keep the Army and Navy playing as at present, both intent on carrying the ball in the same direction

### The Committee on Medical Preparedness of the American Medical Association

DR IRVIN ABELL, Louisville, Ky The Committee on Medical Preparedness of the American Medical Association came into being in June 1940, at which time the Surgeon Generals of the Army, Navy and Public Health Service requested the American Medical Association to undertake a survey of the medical personnel of this country, with particular reference to its qualifications and availability The committee is made up of the general chairman, a chairman for each of the nine corps areas in the country, the President of the American Medical Association, the Chairman of its Board of Trustees, the Secretary of the Association and the Editor of THE JOURNAL

The objectives of the survey were to determine (1) the number of physicians licensed to practice medicine, (2) the number capacitated for active service and those incapacitated for active service, (3) the number and location of physicians who may be qualified and available for the armed forces and for other essential services in case of national emergency, (4) the number available for service to civilian population under emergency conditions, (5) the availability and qualifications of those who can serve in special fields of medicine and (6) the number and identity of physicians qualified for teaching and research and who are essential to maintenance of educational institutions, and the number, age, qualifications, availability and other characteristics of all members of the medical profession essential in order that the total personnel resources can be utilized in intelligent preparation, appropriate assignment and adequate services for the armed forces, expanding industry and civilian population

Mailing of schedules began within less than one month after the creation of the committee, July 5, and was completed on July 6, 1940 In this first mailing 179,976 schedules were sent to the latest known addresses of physicians licensed to practice medicine Subsequent to July 16, 1940 approximately 6,000 were sent to recently licensed physicians and to those who for other reasons were not included in the primary list

Of the total of about 185,800 physicians who received schedules, slightly more than 158,000, or 85.8 per cent, had returned them on Jan 2, 1942 Adjustment of totals for death and duplicates give a total list of about 184,000 The information contained in these schedules is transferred to punch cards To complete the punch card file for all physicians, some 26,000 schedules were prepared for those who failed to make a return, these being prepared in the state medical associations and county societies These are designated as incomplete, since they do not include answers to all schedule questions On Jan 30, 1942 all original and incomplete schedules had been edited, coded and punched These 184,000 schedules and punch cards constitute the live working file of physicians in the United States and the dependencies The compilation of this census is a continuing process, since new schedules from recently graduated physicians are being constantly added and others for deceased physicians are being daily withdrawn A large amount of clerical work is involved in changes of addresses and in properly listing the names of physicians ordered to active duty with the armed forces and of those who have been relieved from duty Time consuming investigation and an important phase of the census pertains to the confidential investigation of professional qualifications This has been largely done by the various committees of the Medical Research Council and by the certifying boards This has been completed for approximately 135,000 physicians Listing sheets are in the course of preparation for the remaining 49,000

The number of physicians under 45, the highest age level of the Selective Service Act, is about 62,000 Out of 134,771 schedules studied from this point of view, 41.1 per cent of the physicians classified themselves as general practitioners, 24 per cent as full time specialists and 34.5 per cent as part time specialists If we classify the part time specialists as general practitioners we have about 100,000 general practitioners and 33,000 specialists

The Subcommittee of Medical Education of the Health and Medical Committee recommended the establishment of an agency for the procurement of physicians for the armed forces, industry and the civilian population This recommendation was referred by the Health and Medical Committee to the Committee on Medical Preparedness, which at Cleveland presented to the House of Delegates a resolution relative to the establishment of a procurement and assignment agency The resolution was unanimously adopted by the House of Delegates and was presented to the Health and Medical Committee on July 2, 1941 The Committee on Medical Preparedness met in Washington on August 19 and 20 to consider this resolution, in conjunction with representatives of various federal agencies On Sept 3, 1941 the President established the Office of Defense Health and Welfare Service with Mr Paul V McNutt as director The Health and Medical Committee was transferred to this office The resolution relative to the establishment of the Procurement and Assignment Service was referred to the Health and Medical Committee, which on October 22 met to initiate the development of this service An agreement on policy was reached and a commission appointed with the Health and Medical Committee to draft a program for its Procurement and Assignment Service, the members of this committee being Frank Lahey, Sidney Burwell, Clarence Selby, Morris Fishbein and Willard Camalier, the latter representing the dental profession This commission met on October 28 and submitted its report to Director McNutt, who in turn transmitted it to the President, with the result that the Procurement and Assignment Service was established on October 30 as one of the subdivisions of the Office of Defense Health and Welfare Service, with the following membership: Dr Frank H Lahey, chairman, Dr Willard Camalier, past president of the American Dental Association, representing the dentists, Dr Harold S Diehl, University of Minnesota, representing medical education, Dr James Paullin and Dr Harvey Stone representing the medical and the surgical civilian profession, and Dr Sam F Seeley, connected with the Surgeon General's Office, who was relieved from active duty therein and assigned by General Magee to the agency as its executive officer

The Health and Medical Committee and the Procurement and Assignment Service are both subdivisions of the Office of Defense Health and Welfare Service They occupy adjoining offices and are closely linked in that the Subcommittees on Dentistry, Hospitals, Industrial Health and Medicine, Medical Education and Negro Health are practically the same The personnel of those committees are identical On December 18, at a meeting of the Board of Procurement and Assignment Service with the Committees on Medical Preparedness of the American Medical Association, the American Dental Association and the American Veterinary Medical Association, a definite organization was completed for the functions of this service in relation to the needs of the professional personnel Approval was given to the constitution of committees in each of the corps areas and associated naval districts to function as advisory to the corps area commander, the committees to consist of a chairman who will be the corps area representative of the Committee on Military Preparedness of the American Medical Association, one physician representing medical education, one representing hospital organization, one representing physicians in the community at large, two dentists and one representative of the veterinary profession The state chairmen, the individual state chairmen of the Procurement and Assignment Service, are the state chairmen of the Committee on Military Preparedness of the American Medical Association

The Committee on Medical Preparedness met in Washington on January 30 with the Procurement and Assignment Service Board and representatives of interested agencies to adopt final plans of procedure in utilizing the professional personnel of the country for the duration of the war

The American medical profession has always risen to its obligations in time of war During the American War of Independence fourteen hundred doctors volunteered During the Civil War twelve thousand physicians served with the Federal forces and nine thousand with the Confederate forces In World War I there were about thirty-one thousand doctors in uniform With the projected increase in the Army of two million men

this year, another thirteen or fourteen thousand physicians will be called from civilian life. Approximately eighteen thousand are serving on the various draft boards of the country. Everywhere, in hospitals, in medical societies, all have their committees on medical preparedness in an effort to contribute to our war effort. No other group has been asked to do as much as the medical profession, and no other special group has volunteered to do as much.

### The Role of Medical Education in the War

DR HAROLD S. DIEHL, Minneapolis. In the United States sixty-seven accredited medical schools carry the responsibility for the professional education of the physicians of this country. These heavy responsibilities in times of war are multiplied manifold.

The first responsibility of medical schools is to provide well trained physicians to meet the national needs. In normal times the five thousand physicians who graduate annually from the accredited medical schools are more than sufficient to replace those physicians who discontinue practice each year. In times of war, however, the medical services of the Army and the Navy demand a quota of physicians five to six times as high. To help meet this need, the medical schools have volunteered to increase enrollments as much as their facilities will permit and to accelerate the graduation of physicians. During the next three years about five thousand physicians will be graduated three months earlier than normal, five thousand more six months early, five thousand nine months early and five thousand twelve months early. The medical schools will be able by this acceleration of the curriculum to make available over the next three years the equivalent of one year's medical service by twelve thousand five hundred physicians. To accomplish this the faculties will have to carry heavy teaching loads and vacations and research will have to be sacrificed. Students will forego the summer respite from studies and the opportunities which vacation periods present to earn money sorely needed by many. The deans of medical schools are convinced that there will be an adequate number of qualified applicants to supply the entering classes under the emergency accelerated program. Up to the present the uniformity of action by Selective Service boards in the deferment of medical students has been greater than would have been believed possible, but there is question whether under the increasing urgency for man power similar uniformity of action can be expected in the future.

The Army and the Navy last summer authorized the granting of commissions to junior and senior medical students with the understanding that they will not be called to active duty until they have completed at least one year of internship. This is excellent, but, unless freshmen and sophomores are kept in school and new classes admitted, it will be only a few years until there will be no juniors and seniors to apply for these commissions. To forestall this possibility the Navy Department and the War Department recently authorized the granting of similar commissions also to freshman and sophomore medical students and to students who are "bona fide" matriculants in approved medical schools.

Procedures have been outlined by the Procurement and Assignment Service to provide for retaining on faculties physicians whose services are essential to teaching and service responsibilities. Deferment of essential faculty members who are not physicians will have to be requested from the Selective Service boards with which such individuals are registered. Memorandum I-347, of Jan. 12, 1942 from National Headquarters of Selective Service advises that "It is estimated that the expanding army will eventually require doctors and dentists in numbers heretofore unknown. They will not be available if those students who show reasonable promise of becoming doctors and dentists are inducted prior to becoming eligible for commissions."

It is equally important that instructors in these fields be seriously considered for occupational deferment. Shortages of qualified instructors are known to exist. The educational institution employing the instructor should be requested to file DSS Form 42A in all cases where deferment is sought.

With our country at war we cannot hope to retain our full peacetime teaching forces but by following the procedures out-

lined in this memorandum, we should be able to retain teachers whose services are truly essential to sound medical education during the war.

No basic changes in the established medical curriculum are necessary. There are, however, certain medical problems peculiar to war which should be added to this curriculum. Prominent among the subjects which merit such special attention are first aid, emergency surgery, psychiatry, internal medicine, dermatology, venereal diseases, public health, tropical medicine, military medicine and aviation medicine.

A course in first aid for freshmen will provide a background for later training in emergency surgery and will prepare undergraduate medical students to play the part which would be expected of them in case of casualties or disasters among the civilian population. In the internship as well as in undergraduate teaching, special emphasis should be placed on the emergency care of fractures and wounds.

Emotionally unstable soldiers are not only worthless but a distinct liability to an army. As many of them as possible should be excluded at the time of the induction examination. Special skill, care, training and time are necessary to identify potentially psychopathic individuals and to prevent their induction. Many, however, are certain to get into the armed forces. The medical officer must be constantly on the alert. In military training emotionally unstable individuals are almost certain to exhibit suggestive symptoms, and medical officers need special training to deal effectively with these problems.

Important among the skills of the medical officer is the ability to make discriminating physical examinations of new recruits. Tuberculosis in the last war has cost this country about a billion dollars for hospital care, insurance compensation and vocational training, and these expenditures still continue at the rate of three million dollars a month. The majority of these infections were present at the time the individuals entered the services.

The use of modern diagnostic technics makes it possible to recognize practically all these infected individuals at the time of the examination. Our medical officers should be trained and provided with the facilities to use these technics. Other aspects of the physical examination for which special skills are necessary are the interpretation of heart murmurs, the estimation of cardiovascular efficiency, the neuropsychiatric examination and the examinations of the eyes and ears, particularly for aviators.

The medical departments of the Army and Navy report that newly appointed medical officers do not have an adequate knowledge of the common skin diseases.

Medical officers in our armed forces are responsible for the prevention and control of communicable diseases, the general sanitation of the camp and the safety of foods, milk and drinking water. During the last war measles, mumps, meningitis, influenza and pneumonia occurred in epidemic proportions in many camps. Additional emphasis needs to be placed on these subjects in order that graduates may be qualified for these special responsibilities.

Most of the instruction in tropical medicine will have to be given as intensive postgraduate courses because few of the medical schools have in their teaching hospitals the patients with tropical diseases essential for clinical instruction. At the undergraduate level, special attention to courses in parasitology and some consideration of the pathologic and clinical features of these diseases will serve to provide the students with an introduction and somewhat of an orientation in this field.

Courses in military medicine have already been instituted by certain medical schools. Yet it is not entirely clear as to just what such courses should include.

Some instruction of this type is desirable, but since a year of internship will intervene before medical graduates are called to active duty it is doubtful whether in the undergraduate course more than a few lectures on this subject given during the senior year are justifiable.

No special course in aviation medicine in the undergraduate curriculum is recommended. However, existing courses in physiology, internal medicine and ophthalmology should stress such subjects as anoxemia, physiology of high altitudes, perception of depth and ocular balances.

The Army and the Navy need a certain number of well trained specialists. Most of the facilities needed for the training of specialists are available. Supplementary to these the medical departments of the Army and the Navy are providing special training in their hospitals, and a few civilian institutions are offering intensive highly specialized courses in limited fields for medical officers. It is unlikely that the Army or Navy will be able to release many medical officers to take advantage of such training during the current emergency.

The last war demonstrated the importance of coordinated groups of carefully chosen physicians to serve on the staffs of special hospitals. Two years ago certain medical schools and hospitals were invited to assume responsibility for providing the medical and nursing personnel for such hospital units. In response, staffs have been organized for army general hospitals, evacuation hospitals and smaller medical units for the Navy. The staffs of these army general hospitals contain fifty-six physicians and surgeons. There is no medical school which can lose such a proportion of its faculty without serious difficulties. Those members of the faculties who remain behind must carry this undramatic but essential service as their contribution to the war. These sponsored units are splendid medical and surgical organizations which are certain to render a quality of service of which our medical schools can be proud.

Medical research has greatly reduced the hazard of communicable disease to the modern army but there remain unsolved problems of major importance. The final decision in this war will be determined not only by the number and the quality of the machines that we build but also by the stamina and the skill of the men who operate them.

The hour is late, but we hope not too late, for the investigation of problems on which will depend the effective utilization of the man behind the gun. Most of the scientists with the training and experience needed for the conduct of such studies are to be found on the faculties of our medical schools. For the past year and a half the various committees and subcommittees of the National Research Council have been outlining the problems to be investigated. There was serious delay in providing support for the investigations recommended by these committees, but funds have been made available through the Medical Committee of the Office of Scientific Research Development for the support of these research studies. To date liberal support has been provided for many investigations in aviation physiology, shock, wound infections, infectious diseases and tropical diseases. This is another field in which our medical schools are privileged to make a significant contribution to the winning of the war.

#### DISCUSSION

DR. ANTON J. CARLSON, Chicago: I don't suppose I should be heard at these meetings any more, but I should like briefly to comment on one of the problems that Admiral McIntire threw in our lap, namely the possible remedy for the nine long years in the preparation of modern physicians. In my school I had the privilege of teaching medical students for many years. We admitted them into the medical school after two years in college. Then we changed and I think required the bachelor's degree, that is, two years more. I have followed my students of both groups as nearly as I could. In general I have found that it didn't seem to make much difference in the caliber of work in the medical school, or in the caliber of work out in the field of their profession, whether they had two years in college or four years in college, when they entered the medical school. Now, that doesn't mean that we wasted the last two years in college. It means that the primary element in success in the school and in the life work is in the caliber of the men and women rather than in the specific courses or in the length of time spent in the college before they come into the medical school. I have heard for thirty or forty years that the medical students and the doctors should have a general, liberal education. Of course, but who is there so green as to think that that can be prescribed by any system of education or any number of courses required? That depends solely on the individual. If you will continue to be omnivorous in your study and reading both inside and outside the college, I don't think there is any other remedy.

## JOINT SESSION OF THE COUNCIL ON MEDICAL EDUCATION AND HOSPITALS AND THE FEDERATION OF STATE MEDICAL BOARDS

FEBRUARY 17—MORNING

DR. J. EARL MCINTYRE, Lansing, Mich., Presiding

### Citizenship as Related to Licensure

DR. WALTER E. VEST, Huntington, W. Va.: The aim of the state in regulating a profession is to protect citizens from the ignorant, the impostor and the incompetent and to guarantee that only individuals are admitted to the professions who can be entrusted to render beneficent service. The physical well being of the populace is so largely dependent on the medical profession that, in the interests of public health, the state must set up standards to be met by individuals who desire to practice medicine. The constitutionality of a full citizenship requirement for medical licensure has been much discussed, but the question has never been adjudicated by the Supreme Court. Generally speaking, the tendency of the courts has been to uphold a citizenship requirement in those callings which have sufficient bearing on the general welfare to demand special training, skill or aptitude. The legislatures of eleven states have enacted laws requiring full citizenship for medical licensure. In seventeen other states full citizenship is required by regulation of their respective examining boards. In only one of these twenty-eight states, Texas, has the requirement been tested in court (*Garcia-Godoy v. State Board of Medical Examiners*). In this instance the court upheld the citizenship requirement as "within the legitimate police powers of the state directed to the furtherance and preservation of public health, safety and morals."

The influx of alien physicians cannot but lower our professional level. Their professional education, ideals and ethics have been acquired in an environment entirely different from prevailing American conditions. Their psychology and their reaction to government are at total variance from ours. With rare exceptions their knowledge of our history, our laws, our customs and our usages is practically nil. In comparatively few instances do they have the familiarity with our language to understand us fully or to be understood clearly by us. What is more necessary in the everyday practice of medicine than a clear understanding between doctor and patient? It is not unreasonable to require the emigre physician to attain full citizenship precedent to licensure. He can accomplish this in five years. We require of native born Americans a longer period of training for medical practice. The emigre physician is escaping a country where, in most instances, he found existence intolerable. I dare say not a single emigre would exchange America with a five year waiting period to attain citizenship and licensure for the land of his birth. In the fiscal year ended June 30 last, four hundred and forty-four alien lawyers were admitted to the United States although they knew ahead of time that they could not practice their profession for at least five years. Especially in time of war, why permit any but full citizens to practice the profession which touches so intimately the lives and moral fiber of our citizenry? Why leave ajar the gates of medicine to those who might engage in sabotage, espionage or subversive activities? In the practice of medicine, physicians are often charged with duties on which the public welfare and the administration of justice depend. It is a privilege granted by the state to individuals who have attained standards set up by the state for its own protection and for the betterment of society. What is more reasonable than to demand of the foreign born seeking admission to our profession that he take time enough to attain full citizenship first, that he spend this time in learning us, our laws, ways, customs, ideals and our democracy, to say nothing of perfecting himself in the technic of American medicine and in the use of our language and proving his loyalty to the land in which he would practice and from which he would derive sustenance?

## DISCUSSION

DR ERNST P BOAS, New York The National Committee for Resettlement of Foreign Physicians has had extensive experience with the problems of the immigration of so many physicians and has been particularly concerned with this citizenship problem. Citizenship requirements were set up primarily as an excuse to keep these foreign physicians out of practice, yet citizenship is not a measure of professional ability. Many states exclude foreign physicians from licensure on the grounds of citizenship, and only citizens can be appointed to federal positions. As a result, some two thousand foreign physicians, most of them well trained, cannot practice in any form. Why not use this reservoir of trained physicians for the benefit of our country? Many, I know from personal knowledge, want to serve in the Army or in government services, but they cannot because they are not citizens. It would seem to me a function of this congress and of the American Medical Association to take measures to liberalize state and national regulations and laws, so that this country in its time of stress can use these several thousand physicians in the national defense.

DR THOMAS J CROWE, Dallas, Texas I want to ask a question. I have a very strong objection now, since I know more about the emigres. I am just as sympathetic with them as any one could be, but I know that a number of spies were sprinkled in that emigre crowd. That is the nicest way in the world to get the inside of everything. If we put those people at work in our communities we don't know what they are doing. I don't think any man is competent to practice medicine in the United States until he can speak our language. Many of them can't speak our language. I think we had better go a little slow on what we do with those people in this country until we know more about them.

DR JULIAN F DU BOIS, St Paul In the last several years we have had about twelve thousand applications for entrance to our medical schools which have taken only from five to six thousand a year and specified that we must have class A schools. To the best of my knowledge there is no evaluating board to go into the credentials of foreign schools. If you take two thousand foreigners whose education cannot be verified by the American Medical Association as to the class of school, it seems to me that you are penalizing American boys. It is not the doctor of today that we should worry about. The boys who want to be doctors we have prevented from becoming doctors. You talk about putting these men out, as the refugee committee has suggested in the place of the men who are in the service, give them their work and let these men come back and get a practice, if they can. If, when a man goes into the Army and gives his all, his place should be given to some foreigner who is in tough luck, that is not my idea of Americanism.

DR WALTER E VEST, Huntington, W Va My idea was that these men are here, and we ought to train them for entrance into the American profession, that in the five years required to attain full citizenship they should serve internships in hospitals that are in need of interns. Thus they can be trained in five years to go out and do reasonable work. They certainly do not fit into American life today. I was amused at what Dr Crowe said about the use of the English language. Until very recently, at any rate, his state provided for the use of interpreters to examine foreign born physicians. That may still be on the statute books of Texas. I have known some emigre physicians who are really fine men. I have known some who were horrible and the percentage of the latter was rather high. My point of view has been developed by being a member of a licensing board for ten years and having come in contact with many emigre physicians. I think that the solution to the problem that I have presented is not unreasonable. I noticed that General Parran yesterday did not say that he would take any of these men into federal service. He suggested that they be allowed to go out into private practice but I feel that the safety of this republic now, in our hour of trial, depends on not allowing an infiltration of foreigners who may be saboteurs or spies or may be engaged in subversive activities.

DR CROWE We don't give them an examination in their own language any more. That is out.

Access to Hospital Records  
Some Legal Aspects

MR T A MCDAVITT, Chicago This paper appeared in full in THE JOURNAL, May 2, page 88.

## DISCUSSION

DR IRVIN D METZGER, Pittsburgh Since this is the only paper on matters of record, I should like to bring in the other phase of it. There are two persons concerned, as far as the accuracy of records is concerned. One is the attending physician and the other is the hospital. The attending physician is the last resort in law in respect to the accuracy of the record. Interns or others who have to do with the case are dependent on the physician who supports the record. Even the laboratory workers are responsible to the physician rather than directly responsible to the law for the accuracy of the record. It is important that the physician in charge of the case be very careful to subscribe, by signature in the records, to the findings and activities relative to the case in every respect. In our state, where record keeping has been a matter of evolution during the last twenty-eight years, we have come to emphasize certain points. One is that every person who is admitted to the hospital shall have a careful survey made of the entire physical condition, regardless of the type of service that the patient may request, so there shall be on the record every significant thing in respect to the physical condition of that patient. Again, at the close of the service in that particular case there shall be a careful survey made of the general condition. We require each physician in charge of the case to make a notation of three things: (1) the general condition on discharge, (2) the condition of the part treated and (3) the disposition of the case for future care. If the patient is discharged with no disposition indicated on the chart for future care, somebody may be held responsible. The follow-up worker each morning can go into the record room and make notes of what the doctor desires in respect to that patient in the future. It is her duty to follow up those directions. That gives specific direction to the follow-up worker's activities throughout the day and makes possible a return report to the doctor with regard to the condition of the patient.

DR W S LEATHERS, Nashville, Tenn I should like to ask a question. Speaking of the uses of patients for teaching purposes, I did not catch the exact meaning. I would infer that he was speaking of private patients. It seemed that the statement made was something of a generalization that might be misused with reference to the use, for example, of a semi-private patient. I would like a more definite statement with regard to whether or not a patient would have just rights in the use of such records.

DR CHARLES GORDON HEYD, New York At the New York Postgraduate Hospital we have had to deal with this problem. A few years ago a junior gynecologist got a blanket permission to review all the cases in that hospital. In his review he came upon a female patient who had a positive Wassermann reaction and who was to be married soon to one of his friends. He told that friend, and there was a commotion about it. I think the hospital was saved a lawsuit by nature of the complaint of the lady and by the fact that the gentleman married her anyway. We have a lot of requests from one of the junior men to review all the carcinomas of the thyroid. A committee was appointed to study this condition, and we arrived at the following conclusions. A person could have access to the charts of all so called ward service patients on the consent of the director of the service. He could not have access to semiprivate or private patients without a specific authorization from the attending physician to the record librarian. Out of that came another angle, that the director of a service might wish to evaluate or appraise the service of one of his juniors, and he, the director heretofore has been in the habit of taking all the patients of that particular individual and reviewing the charts. The committee believed that that was fundamentally illegal and wrong so it limited the ability of the director to review only the cases of this junior that were admitted to the service and the director would have to obtain the permission of his junior to review his private and semiprivate patients. An interesting condition occurs in the large city where a doctor has been the attending

physician of a patient. The patient has left him. He later wants to chisel in on the information that the hospital has obtained. He writes in and states that he was the attending physician, or he may leave the impression that he was still the attending physician and ask for the information. We have always maintained the rule at the Postgraduate that any request for such information must be legally buttressed by a signed request and authorization from the patient for the giving out of that information. Anything short of the most complete safeguards lays the institution and the attending physician open to unending possibilities of lawsuits.

MR. GEORGE E. HALL, JR., Medinah, Ill. As I understand Dr. Leathers' question it is whether or not any differentiation should be made between the records of a private patient and a semiprivate patient, as far as the use, by the hospital, of those records is concerned. In my opinion, I would say that as a general rule it is always best to get the consent of the hospital, whether the patient happens to be a private one or a semiprivate one, because even though the person is a semiprivate patient, that person still has the same legal rights, as far as protection from an invasion of his right of privacy is concerned, as any private patient would have. I think the procedure explained by Dr. Heyd illustrates that it is best to get the consent of all patients, wherever it is possible. Even then the records should be so used that the identity of the patient is not revealed, because that again would open the question of the patient's right of privacy. I thank Dr. Metzger for his view on the need for the doctor and the hospital to be most careful in making records, because in many a malpractice suit, or suit for negligence against the hospital, not only what is in the record but what has been left out is often important. Anything that the attorney for the plaintiff thought should be in there is always a fertile ground for argument to the jury.

#### The Function of the State Hospital as an Educational and Social Agency

DR. WINFRED OVERHOLSER, Washington, D. C. This article appeared in full in *THE JOURNAL*, March 28, page 1027.

#### DISCUSSION

DR. BARROW, New York. Dr. Overholser spoke of the mental hospital rendering service in a number of directions in the community. In most states there are only one, two or three mental hospitals, so that an institution would hardly be able to function over a radius sufficiently large to render service. What would he suggest, at a state level or county level, that the existing agencies might do in the direction of preventing persons who represent departures from the normal from being institutionalized? In some instances, one person in every twenty-five or thirty is spotted as presenting some kind of an emotional problem. They are not all mental cases. In those communities is the responsibility most largely in the welfare department, in the health department or in the educational department, and how might the forces be best equipped to carry forward preventive aspects of this problem?

DR. R. N. WHITFIELD, Jackson, Miss. The author stated that in Mississippi these patients are admitted into the hospital by juries. That has been the case, and perhaps the law still is on the statute book, but no patient gets into our hospital without a thorough examination by the hospital physician himself. The institution in Mississippi—and, we have two of them—cost seven and one-half million dollars and is perhaps one of the finest institutions in the United States.

DR. WINFRED OVERHOLSER, Washington, D. C. As for prevention that is a very important field. The economic necessity of it in this particular field is impressing itself in general on appropriating bodies. I question whether the average county is in a position to set up an organization which could do the job properly. Nearly every state now has state supervision rather than county supervision of the care of the mentally ill. Obviously, the campaign against syphilis is one thing which ought to be prosecuted vigorously from the psychiatric as well as the medical point of view. More important, if possible, is the attacking of the problem in the early years of the individual. It is well established that in many of the cases which get as far as the hospital, on going back into the history of the indi-

vidual one finds that there were behavior disorders in early life. A fair proportion of those certainly are amenable to some treatment and guidance. The establishment of mental hygiene clinics throughout the state is probably one of the best economies that a state can engage in, when it comes to the point of view of saving the cost of later building and in salvaging the lives of these individuals. The development of laws which permit the early admittance and the voluntary admittance of persons in the early stages of mental disorder is one that ought to be encouraged.

DR. BARROW. Which agency do you think, within the state, has the major responsibility? I am quite aware that it is widely distributed, but the agency which has the major responsibility perhaps should give leadership.

DR. OVERHOLSER. It is a strange thing that, so far as I am aware, no state has entrusted the care of the mentally ill to the health department of the state. It is extraordinary. We have the hangover of the colonial laws still, that call for the treatment of the mentally ill in the same class with paupers. We still find them cared for, in a good many places, with supervision of a department of public welfare. If a state is large enough, there ought to be a separate department, I should say, which is headed by a psychiatrist. If not that, certainly a bureau headed by a psychiatrist, I should say preferably in the department of health. I hope to see the day when this problem is going to be recognized as a medical problem instead of one of welfare. In the meantime, however, it is encouraging to know that the profession is developing a psychiatric consciousness, and it is important that all who come into contact with welfare problems should be oriented from that point of view, so at least they will recognize the sort of cases that ought to be turned over to these psychiatric clinics.

#### Acceleration of Medical Training in Canada

DR. E. STANLEY RYERSON, Toronto. Acceleration of the medical curriculum was first propounded to the deans of medical colleges in Canada in May 1941. The deans were informed by the director general of the medical services that about 10 per cent of the doctors in Canada had enlisted in the army, navy and air forces. He presented statistics of the estimated need for doctors and asked if the deans could suggest a method that would help his department to meet this demand. A shortage of doctors existed for service in the armed forces and also for civilian needs. Of the eleven thousand doctors in Canada over two thousand are now in the armed forces. The ratio of doctors to population before this depletion was one to one thousand and now is one to over twelve thousand. The need for more doctors is apparent. Requests have been received from Great Britain in both the United States and Canada for more doctors. The problem was: Could the medical schools devise a method for the graduation of doctors more rapidly?

The deans presented the following resolutions to the Director General as possible steps in meeting the demand for more doctors in the immediate future.

#### Be it Resolved

1 That, because of the shortage of doctors both for the armed forces and for civilian needs, the medical schools of Canada be requested to speed up graduation of medical students during the war emergency.

2 That hospitals in Canada be asked to accept eight months' internship in lieu of twelve months, in order to provide medical officers for military service at an earlier date.

3 That provincial licensing colleges or boards be requested to modify their regulations to permit the curriculum to be completed in a shorter time than their regulations now require.

4 That, as a considerable proportion of medical students depend for maintenance and tuition on their vacation earnings, which under the proposal would be seriously impaired, the dominion government be asked to assist in the financing of students and of the instructional staff where this is necessary.

The Director General asked the deans for an estimate of the financial assistance would be required to reimburse the university relative to its instructional staff, to finance the students and the number of students involved. Another telegram arrived stating that financial estimates submitted were such that the Faculty

of Medicine of the University of Toronto decided that the question of securing financial assistance for students or staff should not interfere with the speeding up scheme and it reaffirmed its former decision that the medical course for all years be started on August 25. The graduating class began its sessions a month earlier than usual and will sit for its final examination (which will be conducted coincidentally by the university and the medical council of Canada) at the end of March and early in April. Its members will graduate in time to enter on their internships on May 1, in which positions they will remain until December 31, when they will be released for military service.

being forthcoming. Four of the latter started their final year in July and their students will graduate, become licensed and enter on their internships three months earlier than they would ordinarily.

The adoption of such a speeded up medical course can be carried out with practically no fundamental change in the date of completion of premedical education or in the order and length and distribution of the courses.

#### Education in Industrial Health

DR STANLEY J SEEGER, M.D., Texarkana, Texas. This article appeared in full in THE JOURNAL, March 21, page 1017.

In table 1 the schedule for the five years now in attendance at the University of Toronto is shown indicating the dates of graduation of the internship and of being available for military service, under the speeded up course, and under the regular course.

In table 2 the dates of the four terms in the University of Toronto course are shown for the session 1941-1942, the regular curriculum for each class being completed during the first second and third terms by the end of March, and the curriculum of the first term of the next succeeding year between April 13 and June 27. In the fourth, third and second years a two weeks vacation is given after final examinations before starting on the work of the fourth term.

In table 3 the progress of each class is shown from its beginning on Aug 25 1941 up to the date of graduation.

This accelerated scheme was adopted only by the University of Toronto, the other schools with the exception of McGill which already has a thirty-six week session being unable to do so owing to financial assistance for their students and staff not

#### The Integrated Course in Anatomy

DR B I BURNS, New Orleans. Modifications in the curriculum of the medical schools during the past twenty-five years have brought much criticism of the standard course in anatomy. The clinical teachers feel that the presentation of the subject has become too academic and that the student's effort is not directed in such a manner as to give a foundation knowledge of the structure of the body which adequately supports his practical training. Realization of some of the defects in the training offered medical students led the staff of the Department of Anatomy of Louisiana State University to consider integrating the four courses in anatomy (gross anatomy, histology, embryology and neuroanatomy) into one course in the hope of providing better opportunities for correlation of anatomy with function and with the clinical fields. The idea was not original. Hooker and his colleagues at the School of Medicine of the University of Pittsburgh abandoned the teaching of separate courses in 1924 and began the experiment of a single

correlated course in anatomy. In each school in which it has been attempted, the integrated course has been proclaimed an unqualified success. Our experiment with it has been under way for seven years. The difficulties of organizing an integrated course in anatomy are largely concerned with determining the proper sequence of various phases of the study. The order is simple, but it calls for the preparation of a laboratory outline, a laborious task. The guiding principle calls for complete gross and microscopic study of a part at one time rather than gross study today and microscopic study two or three months hence. The course begins with a microscopic study of early embryology and the structure of the primary tissues. This training lays the foundation for the microscopic study of the structure and development of any organ. At its conclusion, dissection of the body is begun and from this point the gross study sets the pace for the microscopic. At the opportune time during the gross study of a structure, a laboratory period is scheduled for the study of its microscopic structure and its embryology.

The first seven chapters of the laboratory outline consist of directions for the study of early embryology and the primary tissues. This phase of the study constitutes the first division of the course. The early embryology presentation consists of a study of the development of the fertilized ovum through the formation of the primary germ layers and the fetal membranes. The second division of the course consists in a study of the upper extremity and back. Preceding the beginning of the gross study of this or any other region the student is stimulated, through occasional lectures and frequent quizzes, to familiarize himself with the osteology concerned. The initial laboratory period is devoted to a thorough study of surface landmarks with emphasis on their practical significance. The study of the skin is begun with its gross consideration and reflection of it over the pectoral region. This gross study is followed by the microscopic study of the structure of the skin, skin glands and hair. Next in order is the consideration of the superficial fascia which is reflected. During this procedure the mammary gland and axillary lymph nodes are exposed and studied grossly and finally microscopically. As the dissection progresses, nerves and blood vessels are soon encountered for the first time and are studied microscopically. There is no very good reason for beginning the dissection of the body with the upper extremity. It may be begun anywhere, depending on the whims of the instructional staff but, once it is begun, the accompanying histologic and embryologic studies must be assigned in proper order.

One question frequently raised regarding the integrated program has to do with the amount of time saved. Our experience has not indicated an economy of time in the form of reduction in the total number of hours which may be devoted to the study of anatomy. Perhaps such a course could be organized and conducted in such a manner as to conserve time to some extent. No such objective was contemplated in our course plan. Such an accomplishment could be effected only by avoidance of repetition. Teachers of anatomy will probably agree that frequent recapitulation of ground covered in such a course is desirable if important facts are to be retained. One great advantage in the integration method is that it provides frequent opportunities for recalling knowledge previously gained and correlating it with that based on the study immediately at hand. Repetition becomes a fascinating procedure for teacher and student, and the possibilities offered for accomplishing it in a more natural manner constitute one of the chief advantages of the method. Complete correlation of structure with function and clinical consideration is impossible until all the information regarding the anatomy of the part in question is at hand. Therefore many opportunities for intelligent teaching and study are provided in the integrated course that cannot be found in any other method of approach. By no other means can the sort of consideration be given to the study of an organ or part that simulates the mental approach the practicing physician must adopt. I have never heard an unfavorable evaluation of the method by a teacher or student who has participated in it. Participation in the teaching of such a course requires a teaching knowledge of all the phases of the subject. Each member of the staff must be a complete anatomist. This requirement

constitutes one of the great advantages of the method. The organization and conduct of the integrated course present no serious problems.

#### DISCUSSION

DR THOMAS J. CROWE, Dallas, Texas. Anatomy is one of the most neglected subjects of the college curriculum. I have asked many a recent graduate to give the name of the only spinal nerve which enters the viscera of the body, and I have failed to find one who could.

### THE FEDERATION OF STATE MEDICAL BOARDS

FEBRUARY 17—AFTERNOON

DR J. EARL MCINTYRE, Lansing, Mich., Presiding

#### Industrial Health as Related to Licensure

DR C. O. SAPPINGTON, Chicago. Within the last year the Medical Education Committee of the American Association of Industrial Physicians and Surgeons has presented a report of a plan for the study of industrial hygiene and medicine in medical schools, with an outline of courses for undergraduate students. This report has been accepted by the board of directors of the American Association of Industrial Physicians and Surgeons and has been sent for further consideration to the American Medical Association. The dearth of trained industrial physicians has been disclosed in the evaluation of the available personnel for industrial uses during the war, through the Medical Preparedness Committee of the American Medical Association. At the annual meeting of the American Conference on Industrial Health in November 1941 Dr Rosco G. Leland, Director of the Bureau of Medical Economics of the American Medical Association, presented figures on the availability of industrial physicians and surgeons. Among 157,000 physicians who returned questionnaires, 11,300 received schedules asking for specific information concerning their activities in industrial practice. Of these about 7,500 have returned the special schedules pertaining to industrial practice, and of these 5,700 have been processed for punch cards and about 4,000 have been run through the machines, making the following figures available: 2,967 were engaged in general industrial practice, 617 were engaged in traumatic surgery, 139 were occupied in plant medical department administration, 24 in occupational disease control, 24 in governmental industrial hygiene administration, 49 in workmen's compensation administration, 35 in private industrial hygiene as private industrial hygiene consultants, 17 in industrial toxicology, 18 in casualty insurance administration, 5 in industrial hygiene teaching and 4 in health education of employees.

In the next edition of the American Medical Directory, listed with other specialties will be the specialty of industrial practice. Heretofore industrial surgery has been listed as a specialty, leaving, however, the medical and the industrial hygiene phases without a category in which to be placed unless one chooses to be listed as a specialist in public health. This change is encouraging.

Some of the reasons why a relative minority has been attracted to industrial practice are: 1. Lack of applying a uniform plan for adequate undergraduate instruction in industrial subjects in recognized medical schools. 2. Continued abuses over many years in industrial practice, by persons of unrecognized standing, consequent on the absence of official regulation and standards for qualification, this naturally resulted in commercial exploitation. 3. The habit of well meaning general practitioners using supplementary industrial practice as a "stepping stone" until private work reached the desired volume. 4. The apathetic public reaction, reflected in slow recognition of the necessity to the passage of industrial health legislation.

Some difficulties in teaching undergraduates and physicians the fundamentals of industrial hygiene are found in the necessity of the application of industrial hygiene engineering and chemistry to the problems of prevention and in the investigation of occupational disease claims. These difficulties are not insurmountable. Already a considerable number have become sufficient

well grounded in these technical subjects to give instruction both to undergraduate students and to practitioners in the field. A notable example of postgraduate education of the 'refresher' type was conducted during the past year by the Iowa State Department of Health under the direction of Dr. Walter Bierring. In nine cities specially selected in Iowa there were afternoon and evening meetings on industrial health subjects, varying from consideration of wounds and orthopedics through industrial toxicology, industrial hygiene engineering, the administration of health services in industry and problems of medicolegal importance. Those present believed this a successful method of bringing to the general practitioner fundamental information on these subjects, instead of expecting him to attend meetings at a distance voluntarily.

As to licensure, questions relative to industrial hygiene and occupational diseases have been asked in state board examinations. Dr. Harold Rybins in his book on "Medical State Board Examinations," devoted four pages to industrial hygiene and allied subjects. A rational basis for the solution of this problem involves medical education of undergraduates and practitioners. As desirable as it might be to include questions in state board examinations relative to industrial health, it would be unfair to do so unless organized instruction had been previously given to those who take the examinations. It is suggested that consideration be given to the appointment of a committee on the teaching of industrial health, which could study the problem and make working recommendations to medical schools, examining boards and qualifying groups.

#### DISCUSSION

DR. WALTER BIERRING, Des Moines, Iowa. Dr. Sappington is emphasizing the necessity of incorporating in the examinations of candidates for licensure questions regarding industrial hygiene, occupational disease and industrial health. It takes sixteen men working in industry to support one man at the front, and to keep these industrial workers well is most important in national defense today. The men who are now coming out to practice are efficient in the knowledge of industrial hazards, exposures of various kinds. Their knowledge of occupational disease is lacking. We should recognize that industrial hygiene, occupational disease and industrial health are a most important part of the practice of medicine.

#### Licensure Problems in the District of Columbia

DR. GEORGE C. RUHLAND, Washington, D. C. A Commission on Licensure was created by act of Congress on Feb. 27, 1929 to regulate the practice of the healing art in the District of Columbia. The act provides that the following shall be members of the commission: the president of the Board of Commissioners, the United States Commissioner of Education, the United States District Attorney, the Superintendent of Public Schools and the health officer, who functions as secretary-treasurer. The commission members serve without compensation. The commission being four fifths a lay body, has on occasion adhered so closely to the wording of the law that well qualified physicians were denied licenses. The act required all licentiates of the former Board of Medical Supervisors and all drugless healers to be licensed. Prior to 1929, drugless healers were not licensed in this jurisdiction, and probably because of this all healers were required to be licensed under the new law. Drugless healers were licensed on the basis of practice prior to the passage of the act. Since that time all have been required to pass the basic science examination as a condition precedent to admittance to the professional examinations.

There are three methods by which a person may obtain a license to practice medicine in the District of Columbia: examination, reciprocity and endorsement of the National Board diploma. Graduation from an approved American or Canadian medical school and one year's internship in a class A hospital are a condition precedent to admittance to the District of Columbia medical examination. The examination is written and lasts four days. A person seeking a District of Columbia reciprocal license is required to satisfy the reciprocal requirements set forth in the act. The applicant must be over 21 years of age, of good moral character and a graduate of an approved medical school. He must also have been licensed by regular

written examination, show practice the last two years under authority of the license used as a basis for seeking reciprocity and must satisfy the commission that the jurisdiction whence he comes grants like privileges to licentiates of the District of Columbia. Federal service may be offered in lieu of private practice. The commission investigates the record of all applicants for local licensure so that only well qualified physicians with clear records are admitted to local practice. A diplomate of the National Board of Medical Examiners is eligible to apply for license on the basis of the National Board diploma, the commission procures the diplomate's first and second papers from the National Board and in turn refers them to its basic science and medical examining boards. On the examining boards' favorable recommendation the commission may issue a license without examination. The act provides for the registration of commissioned surgeons of the United States Army, Navy or Public Health Service or medical officers in any other branch of the federal government in the discharge of their official duties. Such registration is effective only as long as the officer's official status remains unchanged. The act also provides for the registration of physicians in adjoining states who have occasion to treat or hospitalize a few specified patients in the District of Columbia. This registration does not permit the holder thereof to open an office or do a general practice in this jurisdiction. The act exempts massage, dietetics and physical therapy if done under the direction of a person licensed to practice the healing art in the District of Columbia.

I want to call attention to Mr. Foley's work in clearing up the classified section of the Washington telephone directory. In conjunction with officials of the telephone company he succeeded in reducing the number of unlicensed persons listed under "Physicians and Surgeons, M. D." from seventy-five to four. Over a hundred cases have been investigated by this office, with numerous prosecutions.

At present the ratio of practitioners to population is 1 to 228, this figure includes federal physicians, based on an estimated population of 770,000. The District of Columbia has 2,138 licensed medical doctors, 848 federal physicians and 375 osteopaths, chiropractors and naturopaths.

When the act was passed in 1929, no provision was made for annual registration. The commission is self supporting in the sense that revenue is derived solely from application fees. There has been a decrease in applicants since the national emergency and a drop in funds to maintain properly the office of secretary-treasurer. Another problem is the physician who appeals to Congress for a special bill to permit him to practice in the District. Because special acts of Congress are a matter of public record, some graduates of second and third rate medical schools got the idea that a special bill should be introduced in their behalf. They knew they were not eligible for admittance to the local medical examination or eligible for reciprocal licensure, but that did not make any difference. They 'camped on the Hill' and not long thereafter a special bill appeared authorizing and directing the commission to issue the license. In some instances the individuals applied to the commission first, in other instances they just didn't bother. Why take the time to get in touch with the licensing agency when they were going to be licensed by special act of Congress anyway? It is fortunate that these bills are referred to the District of Columbia Board of Commissioners and in turn referred to the commission. We oppose the special bills as a matter of principle and in each instance point out the applicant's lack of qualifications and request Congress to let the commission pass on applicants entirely on their merits.

There is pending in Congress a bill to require annual registration and another requiring citizenship as a condition precedent to licensure in the District of Columbia. One foreign physician applied for a reciprocal license, and his application was rejected twice on its merits. He appealed to Congress, and the commission was authorized and directed to issue him a license. By special legislation he was granted a privilege denied American citizens who failed to satisfy local licensure requirements. The national emergency may necessitate a broader interpretation of rules and regulations dealing with medical licensure. The commission, however, will not relax its standards and will insist at

all times that a person licensed to practice the healing art in the District of Columbia be well trained and a man of good moral character

### Have Basic Science Medical Laws Advanced the Skill of Doctors or Improved the Public Health?

DR T J CROWE, Dallas, Texas I can't understand how two examinations for license can possibly be of help to anybody except the incompetents, whom they dignify and with licensure embolden to extend their pernicious practices I've wondered why the framers of the basic science acts did not realize that the drugless healer's colleges could give their students "quiz compend or Goepp courses" sufficient to pass the five subjects before a nonmedical board of examiners, by whom no practical laboratory tests are given

What's the use? 'Twill be only a few months, at most, until some "smart guy" discovers that all physical and mental ills of mankind emanate from "a kinked little toe" or that anterior subluxation of "Adam's apple" is enemy number 1 of the human family, when the mob will flock to them, and we'll have all to do over again Only in healing would such burlesque be tolerated for a single hour, unless the fellow who said "Life is just one damn thing after another" was right

I'm amazed that the church people haven't taken up the basic science idea and asked for a statute requiring that all atheists and infidels shall study and pass examinations in the ten commandments and the Lord's prayer, that the A's and I's shall be the better prepared to deny and to blaspheme their creator

After fifty years' experience with the sick, I'm of the opinion that all persons must be protected against their own lack of information or judgment in matters involving technical skill, as well as against deception and imposture by public servants The state owes to its people to enforce "one" safely high, uniform standard for the issuance of license to make a living off the misfortunes of the sick Every doctor, regardless of method, must be a competent diagnostician Every doctor should know all that may be learned in a reasonable period of years of study and training under the tutorage of recognized, competent instructors Regardless of his methods, every doctor must be educated and adequately trained but above all he must be a competent diagnostician

I cannot understand why the public and the reputable medical profession should not maintain and enforce beneficent, scientific principles and technics and not give licensure to every racketeer with a theory of the cause of diseases and a ridiculous manipulative cure for them Texas has maintained since 1907 a single standard for all who would engage in the treatment of the sick, regardless of school of graduation or method of practice All must be measured by the same yardstick, and all who measure up to the specifications are citizens and graduates of reputable colleges and are given identical privileges of licensure to practice medicine and surgery by any method not in conflict with the criminal statute and this is as it should be the world over We've had to fight through every session of our legislature to maintain it Except for its definition, which I've tried many times to have amended, the Texas medical practice act is the most consistently impartial medical law of the United States We tried the multiple practice acts, multiple boards and multiple limited licensure from 1901 to 1907, when we found we had developed a multiplied chaos which we could no longer tolerate The present amended act eliminated that system

### DISCUSSION

DR CARL G PATTERSON, Baker, Ore If they will adopt a basic science law in Texas they won't have that trouble We have tried it in Oregon for six or eight years During that time we have not a single chiropractor or naturopath who has passed that examination That should be sufficient recommendation for continuing the basic science law in Oregon

CHARLES CARTER, PH D, Fairfield, Iowa We have had a basic science law in Iowa since 1935 There are many improvements to be made in the basic science law which we have in Iowa The basic science is a screen which takes out a good many that never come before the licensing boards The basic science board in Iowa is not a licensing board in any sense It seemed to me that Dr Crowe had that idea in his discussion

DR JULIAN F DU BOIS, St Paul In 1927 Minnesota passed her basic science law At that time we had about 300 osteopaths and 600 chiropractors We now have 160 osteopaths and 300 chiropractors Prior to 1927 our average five year period was licensing 46 chiropractors We have no brief with Dr Crowe on his chiropractors but the subject was basic science In Minnesota it has worked

O E MADISON, PH D, Detroit Our law in Michigan was passed in 1937, but one of the other branches of it, the chiropractors and osteopaths, brought suit against the board to declare it unconstitutional So it didn't get to functioning until 1939 I agree with the doctors from Iowa and Minnesota that it serves as a screening affair, to keep out those who might otherwise get in We are trying in Michigan to work out a means whereby we can get more cooperation between the various boards, that is, the state board of examination in chiropractic and osteopathy and medicine, whereby the chiropractic people and the osteopathic people will realize from the beginning that they are up against something If it doesn't do anything more than strengthen the kind of work that is given in those subjects in the various schools, it will have served a helpful purpose

DR J W BOWERS, Fort Wayne, Ind Last year I gave a paper on this subject, and there was a committee of the basic science boards that promised to give a reply this year on reciprocal relations So far I have not heard anything about that I am afraid we are throttling the medical profession in order to inhibit certain cults or irregular practitioners to our own disadvantage Each person who qualifies medically takes the basic science subjects before his respective state medical board If he does this once, it ought to suffice for life He should not be required to repeat these examinations in the basic science subjects any more than he should take the examination in all the clinical subjects If we are going to have the basic science subjects, let's reciprocate with the medical doctors or those who do take the sciences, when they desire to go from one state to another I defy the average medical man who has been in practice for fifteen to twenty-five years to pass these basic science examinations To take these examinations every time they might desire to reciprocate from one state to another would be practically an impossibility with the average practitioner of medicine

DR CARTER At the last meeting there was a motion made to establish a committee but for some reason that information was never conveyed to any members of our basic science boards Therefore when he says that has not come from the board it is because we have had no official notice of it

PRESIDENT MCINTYRE That is true, Dr Carter They were invited to attend this meeting in the hope that they might perfect their own basic science organization, whereby it would eliminate the retaking of basic science board examinations by the medical men who were reciprocating from one state to another We hope that you men of the basic science boards will perfect this organization I believe the federation would agree in extending to you an invitation to come back next year and have a representation from each basic science board We hope that you will perfect that organization

DR CARL G PATTERSON, Baker, Ore As I remember, last year a motion was made that the secretary of this federation extend to the representatives of the sixteen basic science boards an invitation to be present at this federation meeting I move that that invitation be extended to the representatives of the basic science boards to meet with us next year

DR DU BOIS I second it

DR T P MURDOCK, Meriden, Conn I am not a member of the healing arts board in Connecticut but I am familiar with the operation of the law in Connecticut We were the second state in the United States to adopt a basic science board. A provision was placed in the law covering the situation that has been discussed this afternoon The law provides that a man who has been in practice in another state for three years may be certificated by the healing arts board without examination A man who has been in practice in another state for a period of five years need not appear for certification or examination before the healing arts board After seventeen years or 13

science board in Connecticut, we are thoroughly sold on it. We believe it screens not only poor practitioners of our own but also screens very carefully all the members of cults.

[The question was put to a vote and carried.]

DR CROWE I had no idea that the basic science was a licensing board. I mentioned the fact that they had to take two examinations for license to practice. I have heard it said that some of these boards, since they have organized the basic science board, haven't licensed a single chiropractor. We have never issued a chiropractic license, still we have men who are not licensed and are practicing in violation of the law, and you are not convicting them. If we have a medical science that is worth defense why give some fellow a living to fool people every day? Wisconsin adopted basic science and left bacteriology out of it absolutely. Worst of all, they have all left diagnosis out. If we are protecting the public, let's do it. The basic science law was not called for by the public. It was called for by the medical doctors. Diagnosis means something to the public, and we should have diagnosis in our basic science. I am against having more than one license certificate.

#### Revision of Constitution and By-Laws

PRESIDENT MCINTYRE The next item is the consideration of the revision of the Constitution and By-Laws of the Federation of State Medical Boards of the United States.

DR I. D. METZGER, Pittsburgh I move that they be adopted as proposed.

DR WHITFIELD (Mississippi) I second the motion.

DR PATTERSON I move to amend the motion so that section 3 shall read as follows:

All the individual members of each state medical board member are ex officio fellows of this federation so long as they legally are members of such state medical board.

C. B. BLAKESLESS, Indianapolis I second that motion.

PRESIDENT MCINTYRE All in favor of the amendment will say 'aye'. The motion is carried.

PRESIDENT MCINTYRE The Constitution and By-Laws as amended are declared adopted.

#### GENERAL DISCUSSION

DR WILLARD C. RAPPLEYE, New York I regret I wasn't here yesterday on account of the discussion regarding the accelerated program. We are deeply appreciative of the action taken by your federation in support of our desire to participate in this national emergency program. Sixty of the medical schools already have signed up to do it, three have indicated that they will not be able to accelerate, two of them have good reasons and one doesn't. The great majority of the schools are prepared to do their part in the national emergency.

DR WALTER BIERRING, Des Moines, Iowa Then you would change matriculation to 'from beginning instruction to graduation'?

DR RAPPLEYE The thirty-six months bother us. Matriculation, in the university sense, is the beginning of instruction. Matriculation, as now announced by the War Department in the granting of commissions in the Medical Administrative Corps is any time that the student is accepted and pays a fee. A fee of \$1 is all that is necessary for him to become a matriculated student. Therefore he can matriculate nine months in advance of his beginning instruction. We don't want to have any confusion with your boards about that, because there is a technicality there some of them would pick up. Our idea would be that your thirty-six months period should be from the period of the beginning of instruction of the first year of medicine until the actual signing of the diploma.

DR R. N. WHITFIELD, Jackson, Miss I move that we change these phrases to conform to Dr Rapple's suggestion.

DR METZGER I would like to second that.

DR RAPPLEYE Is it not true that there are states that could not legally recognize a diploma granted thirty-five and one-half months after instruction?

DR BIERRING Yes, two states and the District of Columbia.

DR RAPPLEYE So it is up to us to change all diplomas to make sure that the dating of no diploma is less than thirty-six months after the beginning of instruction in the first year.

## Medical Examinations and Licensure

### MEDICOLEGAL ABSTRACTS

**Workmen's Compensation Acts Right to Require Claimant to Submit to Physical Examination**—The workmen's compensation act of Virginia provides that a child over the age of 18 is presumed to be totally dependent if physically or mentally incapacitated from earning a livelihood. After her father had died as the result of an accident during his employment with the defendant employer, the claimant, a 26 year old unmarried daughter of the deceased, filed a petition for compensation under that provision. Prior to a hearing, the claimant was ordered by the industrial commission to submit to a physical examination by two physicians selected by the defendant's insurance carrier, also a defendant in this proceeding. The examination was made over the objections of the claimant. At the hearing these physicians testified that the claimant's heart and lungs were normal and that she was able to do ordinary work, such as clerking in a store. Such work, they said, would be beneficial to her. The claimant called as witnesses two physicians who testified that her blood pressure was low and her pulse rate high, that her heart showed signs of muscular weakness and enlargement and that her lungs showed areas of calcification. The claimant was, in their opinion, physically unable to work at any gainful occupation. From an order denying compensation, the claimant appealed to the Supreme Court of Appeals of Virginia.

The claimant contended that the commission had no authority to compel her to submit to a physical examination and that the testimony of the insurer's physicians was therefore inadmissible. The only provision in the workmen's compensation act having anything to do with physical examinations is section 64. It provides that the commission or any member thereof may, on the application of either party or on its own motion, appoint a disinterested and duly qualified physician to make any necessary medical examination of an employee and that the physician so appointed may testify as to his findings. While the claimant was not an employee within the meaning of this section, the court indicated that it is clearly the modern trend for a court to require a plaintiff in an action to recover damages for personal injuries to submit before trial to a reasonable physical examination by competent physicians when such examination is necessary. The right so to order is within the inherent discretionary power of a court in order to prevent the perpetration of a fraud by feigned personal injuries. But, said the court, the better rule is that unless consent is given to the examination the court should designate an impartial and disinterested physician, not one selected by the defendant. Here the commission compelled the claimant to submit to a physical examination by physicians chosen by the defendant's insurance carrier. In doing so, it erred. Their testimony excluded, the evidence was uncontradicted that the claimant was physically incapable of earning a livelihood. The court therefore reversed the order denying compensation and remanded the cause to the commission for the awarding of proper compensation.—*Basham v R H Lowe, Inc*, 11 S E (2d) 638 (Va, 1940)

**Workmen's Compensation Acts Death from Unintentional Poisoning Following Industrial Injury**—In November 1935 an employee while in the employ of the defendant sustained an industrial injury which necessitated the amputation of the terminal phalanx of the great toe six months later. Postoperative treatment continued until June 16, 1936, when he was discharged by his physician. A few days thereafter the employee experienced pain in his right foot and leg and during the day he took sedative tablets which the physician had prescribed. The pain continued during the night and through mistake a mercury bichloride tablet was taken instead of a sedative tablet. Death followed within five days and was concededly due to mercury bichloride poisoning. His widow, the claimant, filed a petition for compensation under the New York workmen's compensation act. An award was eventually granted by the state industrial board which was affirmed by the supreme court, appellate division (11 N Y S (2d) 849, 19 N Y S (2d) 901, J A M A 115 156 [July 13] 1940), on the finding, in effect, that the industrial injury caused the pain and that the attempt to alleviate the pain resulted in the mistaken choice of tablets and ultimate death. The insurance carrier and the employer appealed to the Court of Appeals of New York.

The Court of Appeals could find no evidence that the accident and the amputation which followed were sufficient to derange the employee's mind or affect his eyesight. He had suffered pain throughout the day preceding his fatal mistake, but proof of pain alone does not permit the implication that such a derangement had taken place as would have caused him to make the mistake which took his life. It was not disputed, the court said, that an independent act by the employee intervened to cause his death. His fatal act of taking internally a mercury bichloride tablet, instead of the mild sedative prescribed for his use, did not relate itself to the accident which he sustained in November 1935. Following such independent act there remained intact no chain of causation between the accidental injury and the fatal consequences of the mistake. Finding no evidence that the employee's death resulted from an accidental injury arising out of and in the course of employment, the Court of Appeals reversed the judgment of the lower court and vacated the award in favor of the claimant.—*Brown v New York State Training School for Girls*, 32 N E (2d) 783 (N Y, 1941)

**Compensation of Physician Liability of Employer and Insurance Carrier in Common Law Action to Recover for Medical Services Rendered Employee**—The plaintiff, a physician, brought a common law action of assumpsit against the defendant employer and his insurer. He alleged that one Marks was injured in the course of his employment with the defendant employer and retained him to treat his injuries, that a few days subsequently the defendant employer and his insurer, the other defendant in the action, authorized him to continue his care and treatment of the employee and promised to compensate him adequately for all treatment and care he might render, and that, relying on such promise, he performed certain services of a stated value for which the defendants had refused to pay. The defendants filed a pleading which, in the opinion of the Supreme Court of Rhode Island, in effect, was either a plea in bar or amounted in substance to a demurrer, alleging that the action should be abated because the physician was attempting to enforce at common law a claim that properly could be enforced only under the workmen's compensation act of Rhode Island. The trial court sustained the defendants' plea and abated the action, and the physician appealed to the Supreme Court of Rhode Island.

In support of their contention that recovery could be had against them only under the workmen's compensation act, the defendants relied on *Henry v American Enamel Co* 48 R I 113, 136 A 3. In our opinion, said the Supreme Court, the defendants' contention is not sound. The *Henry* case cited by them is not applicable to the facts and circumstances of this case as set out in the plaintiff's declaration. In the *Henry* case the court held, in substance, among other things, that the workmen's compensation act permitted an injured employee to select his own physician, that by force of that statute alone and entirely apart from any act or consent of the employer.

the latter became liable to a physician for his fees up to a specified amount under certain conditions and limitations, that the workmen's compensation act created a new right in favor of a physician against an employer, a right having no existence or enforceability apart from the act which provided for a method of enforcement, and that the act did not give a physician an action equivalent to assumpsit against the employer of the injured person. The Henry case, continued the court, thus clearly defined the nature and scope of the right of a physician under the workmen's compensation act to recover his fees from the employer of an injured person who was treated by that physician. That case, however, did not purport to deal with or to limit any other rights which a physician might properly have to collect his fees from an injured person's employer or from any one else by virtue of an independent agreement, entirely apart from the right created by the workmen's compensation act. The act gave to the physician an added remedy to be enforced in a certain manner but did not make that remedy exclusive. There is, therefore, nothing to prevent a physician, if he sees fit from bringing an ordinary action of assumpsit for the collection of his fees against his patient's employer or another entirely apart from the right created under the act, provided he can allege in his declaration facts necessary to support such an action.

In our opinion, said the court, an examination of the declaration as a whole in this case shows clearly that the physician is attempting to bring an ordinary action of assumpsit, entirely apart from the right created under the workmen's compensation act. The gist of the declaration is the allegation that the defendants authorized the physician to continue his treatment of the patient and promised that they would adequately compensate him for such services. This claim is plainly entirely independent of any right created in the plaintiff's favor by the workmen's compensation act, a right requiring no promise for its support but being merely an obligation of the employer and his insurer existing by force of the workmen's compensation act itself.

The same court accordingly concluded that it was error for the trial court to abate the action and remanded the case to the trial court for further proceedings—*Vighaccio v United Wire & Supply Corporation* 23 A (2d) 893 (R I 1942).

**Award Under Federal Longshoremen's and Harbor Workers' Compensation Act as Bar to Action for Damages for Alleged Aggravation of Industrial Injuries by Malpractice of Attending Physicians**—A workman, says the Supreme Court of Washington, who has been awarded compensation under the Federal Longshoremen's and Harbor Workers' Compensation Act for injuries sustained in an industrial accident within the coverage of that act and for the aggravation of those injuries allegedly resulting from the negligence of his attending physicians cannot thereafter maintain an action against the attending physicians for damages resulting from their alleged malpractice—*Anderson v Allison* 122 P (2d) 484 (Wash, 1942).

## Society Proceedings

### COMING MEETINGS

- American Medical Association Atlantic City N J June 8-12 Dr Olin West 535 North Dearborn Street Chicago Secretary
- American Association for the Study of Allergy Atlantic City N J June 8-9 Dr J Harvey Black 1405 Medical Arts Bldg Dallas Texas Secretary
- American Association for the Study of Goiter Atlanta Ga June 1-3 Dr Thomas C. Davison 478 Peachtree St. N.E. Atlanta Ga. Secretary
- American Association for the Study of Trauma Boston June 4-6 Dr Gordon M. Morrison 520 Commonwealth Ave Boston Secretary
- American Association of Genito-Urinary Surgeons Hershey Pa May 27-29 Dr Charles C. Higgins 2020 East 93d St Cleveland Secretary
- American Association of Oral and Plastic Surgeons New York May 28-30 Dr Frederick A. Figg 102 Second Avenue S.W. Rochester Minn Secretary
- American Association on Mental Deficiency Boston May 13-16 Dr Neil A. Dayton 100 Nahua St Boston Secretary
- American Broncho-Esophagological Association Atlantic City N J June 8-9 Dr Paul H. Holinger 700 North Michigan Blvd Chicago Sec retary

- American College of Chest Physicians Atlantic City N J June 6-8 Dr Paul H. Holinger 500 North Dearborn St Chicago Secretary

- American Urological Association New York June 1-4 Dr Clyde L. Deming 789 Howard Ave New Haven Conn Secretary
- Arizona State Medical Association Prescott, May 25-30 Dr W. Warner Watkins 15 East Monroe St., Phoenix Secretary
- A Association for the Study of Internal Secretions Atlantic City N J June 8-9 Dr Henry H. Turner 1200 North Walker St Oklahoma City Secretary
- Connecticut State Medical Society Middletown June 3-4 Dr Creighton Barker 258 Church St New Haven Secretary
- Illinois State Medical Society Springfield May 19-21 Dr Harold M. Camp 224 South Main St Monmouth Secretary
- Kansas Medical Society Wichita May 11-14 Mr C. G. Munns 112 West Sixth St. Topeka Executive Secretary
- Maine Medical Association Poland June 21-23 Dr Frederick R. Carter 142 High Street Portland Secretary
- Massachusetts Medical Society Boston May 26-27 Dr Michael A. Tighe 8 Fenway Boston Secretary
- Minnesota State Medical Association Duluth June 28-July 1 Dr B. B. Souster 493 Lowry Medical Arts Bldg St Paul Secretary
- Mississippi State Medical Association Jackson May 12-14 Dr T. M. Dye P. O. Box 295 Clarksdale, Secretary
- National Gastroenterological Association New York June 3-5 Dr G. Randolph Manning 1819 Broadway New York Secretary
- New Hampshire Medical Society Manchester May 12-13 Dr Carleton R. Metcalf 5 South State St Concord Secretary
- New Mexico Medical Society Santa Fe June 25-28 Dr L. B. Cohenour 221 W. Central Avenue Albuquerque Secretary
- New York State Association of Public Health Laboratories Cooperstown May 18 Miss Mary B. Kirkbride, New Scotland Ave Albany Sec retary
- North Carolina Medical Society of the State of Charlotte May 11-13 Dr Roscoe D. McMillan P. O. Box 232 Red Springs Secretary
- North Dakota State Medical Association Jamestown May 18-20 Dr L. W. Larson 221 Fifth St Bismarck Secretary
- Pacific Coast Oto-Ophthalmological Society Portland Ore. May 11-14 Dr C. Allen Dickey 450 Sutter St San Francisco Secretary
- Pacific Northwest Medical Association Portland Ore. June 17-20 Dr C. W. Countryman 407 Riverside Ave Spokane Secretary
- Rhode Island Medical Society Providence June 3-4 Dr William P. Buffum 122 Waterman St Providence, Secretary
- Society of Surgeons of New Jersey Montclair May 27 Dr Walter B. Mount 21 Plymouth Street Montclair Secretary
- South Carolina Medical Association Myrtle Beach May 19-21 Dr Julian P. Price 105 West Cheves St Florence Secretary
- South Dakota State Medical Association Sioux Falls May 13-15 Dr Clarence E. Sherwood 107 1/2 Egan Avenue South Madron Secretary
- Texas State Medical Association of Houston May 11-14 Dr Holman Taylor 1404 West El Paso St Fort Worth Secretary

## Current Medical Literature

### AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1932 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (\*) are abstracted below.

#### American Journal of Clinical Pathology, Baltimore 12 73-128 (Feb) 1942

- Effect of Paraffin Hydrocarbons on Tuberculoallergy and Tuberculoimmunity Produced by Tubercle Bacilli. H. J. Corper and M. L. Cohn, Denver—p. 73.
- \*Histoplasmosis "Darling". T. L. Ramsey and A. A. Applebaum, Toledo, Ohio—p. 85.
- Capillary Venous Differences in Blood Glucose Values During One Hour Two Dose Glucose Tolerance Test (Exton-Rose Procedure). P. H. Langner Jr. and H. L. Ties, Philadelphia—p. 95.
- Xanthoproteic Reaction and Phenol Content of Plasma in Patients with Urea Retention. R. S. Hubbard, F. E. Kenny and J. F. Mezen, Buffalo—p. 103.
- Technic of Kolmer Complement Fixation Tests for Syphilis Employing One Fifth Amounts of Reagents. J. A. Kolmer, with technical assistance of Elsa R. Lynch, Philadelphia—p. 109.
- Nodular Tuberculosis of Liver and Spleen. Case Report. J. E. Welker and J. H. Hill, Kansas City, Mo.—p. 116.

**Histoplasmosis**—Ramsey and Applebaum report a case of histoplasmosis with necropsy. The patient had lived all her life in Michigan and had never visited or lived in the tropics. The organic changes were principally hyperplasia of the cells of the reticuloendothelial system with infection of these cells by the fungous parasite, particularly in the spleen, liver, lymph nodes, lungs and bone marrow. The ulceration in the intestinal tract was probably caused by infection of the lymphoid tissues and reticulum cells in the submucosa. Clinically the disease may suggest Banti's disease, Gaucher's disease, obscure malignant conditions, tuberculosis, undulant fever in the early stages and primary dyscrasias of the blood. A definite diagnosis of histoplasmosis can be made only by isolating the fungus in the tissues of the body or in cultures of material from these tissues. To date there have been no instances of cure and no satisfactory treatment.

- Syphilitic Aortitis of Congenital Origin in Young Children. Review of Literature and Report of Case. J. Yampolsky and C. C. Powell, with pathologic assistance of R. Mosteller, Atlanta, Ga.—p. 371.

**Immunization of Infants**—Lapin discusses the immunity responses of 78 infants aged 6 to 9 months who were given five monthly injections of a combination of clear diphtheria toxoid, alum precipitated tetanus toxoid, whooping cough vaccine and whooping cough toxin. Immunization to diphtheria resulted in all the subjects, 97 per cent showing more than  $\frac{1}{250}$  unit of antitoxin per cubic centimeter of blood and 91 per cent more than  $\frac{1}{40}$  unit per cubic centimeter. In 93.2 per cent the average tetanus antitoxic level rose to 0.5 unit, three months after immunization the antitoxic level was greater than that attained by the usual prophylactic injection of tetanus antitoxin. Evi-

dence is cited which shows that the 68 per cent whose titer was below this level three months after immunization have a sound "basal immunity" and that on exposure they will respond to a boosting dose of antitoxin with a safe antitoxic level. The whooping cough immunization resulted in positive reactions to agglutination tests for all the subjects, complement fixation of 4 plus for 87.2 per cent and positive for 97.4 per cent, and a positive mouse protection titer for 87.5 per cent.

**Essential Fructosuria**—Sachs and his associates report the occurrence of essential fructosuria in 2 brothers and present some experimental studies which attempt to explain the mechanism of the condition. A hypothesis is presented that the mechanism is a failure of part of the ingested fructose to be broken down to lactic acid. The authors further speculate that in normal human beings about 80 per cent of ingested fructose is converted to glycogen, the remainder being broken down to lactic acid. In their patients 10 to 20 per cent of the fructose ingested was excreted as such in the urine instead of being metabolized. The hypothesis would seem to account for the failure of a normal increase in the concentration of lactic acid in the blood and a rise in the respiratory quotient. The abnormality may lie in the failure or lack of some as yet undetermined local specific enzymatic action. The work of Sterkin and Vengerova and of Rynbergen, Chambers and Blatherwick adds validity to this hypothesis.

**Creatine Metabolism in Hypothyroidism**—Poncher and his associates state that their observations on 6 hypothyroid girls, aged 8 months to 13 years, throughout a period of continuous therapy with thyroid substantiate their earlier contention that the creatinuria response to the administration of thyroid is of diagnostic value along with clinical observations. The basal metabolic rate as ordinarily determined is an unreliable criterion in young and in hypothyroid children. The cholesterol value of the blood and roentgenograms are not always informative. Only 2 of the 6 subjects exhibited an elevated level of cholesterol, and because of previous treatment only 2 exhibited any delay in the appearance of the carpal centers at the wrist. No one chemical test is a measure of thyroid activity for all hypothyroid children. However, it is more convenient to carry out studies of the serum cholesterol than of the urinary creatine, but cholesterol determinations are no more informative than carefully controlled creatine studies. The determination of the degree of creatinuria in the 6 hypothyroid children was a valuable aid in the diagnosis. The amount of creatine excreted by a hypothyroid child might be used in gauging the effect of thyroid therapy. The level of urinary creatine serves only as an adjunct to the structural and functional observations on which the diagnosis of hypothyroidism is based. The establishment of a normal type of creatine metabolism was followed by clinical improvement in the 6 subjects. Basal metabolic rates in 3 of the hypothyroid children varied widely, depending on the standard of reference used. The upward trend in the rate as affected by treatment is considered far more significant than the actual numerical values. The rate of energy exchange in the 6 children was not as closely related to the urinary preformed creatinine as it was to height, weight and surface area.

**Nonobstructive Hydrocephalus**—Scarff discusses his experiences with 20 patients during the last seven years and summarizes results obtained in the treatment of communicating hydrocephalus by endoscopic cauterization of the choroid plexus with the ventriculoscope. Forty-eight cauterizations (on one side of the plexus) were performed. There were 3 operative deaths, a mortality of 15 per cent and an operative mortality of 6 per cent. No deaths have occurred during the last four years. Of the children who survived the operation 7 were discharged from the hospital, but the result of their treatment was generally unsatisfactory. The result in the remaining 10 was satisfactory and a lasting reduction of intracranial tension was attained. One of these 10 died after five years, the other 9 are still living after six months to more than six years. Four of the 9 surviving children have an essentially normal mentality, 3 are moderately retarded and 2 are decidedly retarded. One of the successfully treated patients had premeningitic hydrocephalus. He apparently is the first patient

this sort to be the subject of a report. A second patient, who was similarly treated, is still living, although the result of treatment is not considered satisfactory. Acute intraventricular hypotension as a postoperative complication, described for the first time, occurred in 3 children. The importance of early diagnosis, careful choice of patients, radical operation, close follow-up observation and early reoperation if pressure returns is stressed. The results warrant a wider use of the method. A lower mortality and a higher average mentality in patients so treated may be expected in the future.

\*Cortical Extract in Treatment of Shock. Preliminary Report. L. S. Helfrich, W. H. Cassels and W. H. Cole. Chicago—p. 410.

**Fractured Patella.**—Dobbie and Ryerson were prompted by the good results obtained in 1937 by Brooke of England to excise completely a fractured patella in 21 patients. A patient who required an open surgical procedure was treated by a complete excision of the fragments. All the fractures but one which was compound, were simple. The average postoperative hospitalization period was twenty-two and seven-tenths days. The average period for 8 private patients was seventeen and one half days. Patients without complications were able to walk well without dressings and or discomfort at the end of the second week. As no physical therapy other than active use is prescribed there is no reason to keep such patients in the hospital any longer. With progressively increasing activity at the end of six to eight weeks the patient is able to walk long distances and to walk up stairs. No functional impairment remains at the end of four months. The end result was considered excellent only when the function of the limb and knee joint was normal. Of the 21 patients 1 died in the seventh postoperative week from pulmonary embolism for 2 sufficient time has not elapsed to expect or to warrant a complete return of function, 2 failed to report for the final check up and in 16 an excellent result was demonstrated from three to forty-one months postoperatively. These 16 have returned to their usual work as laborers or housewives. The range and rapidity of movement and the power of the knee joint from which the patella was removed are in no way inferior to that displayed in the opposite intact limb.

**Effect of Sulfathiazole.**—Weil and his associates report the results obtained with the local application of sulfathiazole in 31 fresh compound wounds, 58 compound fractures and 22 simple fractures requiring operation. Their usual technic of handling wounds and compound fractures was changed in only two respects: (1) application of sulfathiazole crystals directly to the wounds and (2) closure without drainage. An operative procedure was found necessary in 89.6 per cent of the compound fractures. Cultures of material from the wounds showed pathogenic organisms in 50 per cent. Almost all of the cultures were taken within six hours of injury. Infection after sulfathiazole had been applied developed in 6 compound fractures. However in 2 of these bacteria were found in completely

necrotic tissue, and in 1 case in which a fracture of the skull was compounded through the mastoid and middle ear local application of the drug was impossible. This brings the incidence of infection to 5.4 per cent. Of the 3 remaining cases the drug in 1 was applied locally at the time of injury, the wound in 1 continued to discharge a purulent exudate for several weeks in spite of repeated local treatment, and gas gangrene developed in 1 despite prophylactic use of the drug. It is the authors' belief that the administration of large doses of sulfathiazole locally and orally within three or four hours of injury continued for nine to fourteen days will in many cases prevent gas gangrene. Sulfathiazole has not been very effective in the treatment of active gas gangrene. The wounds in the other 52 cases healed without infection in a manner approaching primary union save for the occasional discharge of a clear, non-purulent serosanguineous exudate. A reparative operation was necessary in 67.8 per cent of the 31 cases in which wounds of the soft tissue occurred. Healing comparable to primary union occurred in 25, 5 showed a moderate delay of healing because of a collection of serum within the wounds or of loss of soft tissue and a superficial but persistent infection developed in 1 which responded after six weeks of local therapy. Two deaths occurred but they were due to complicating injuries. The healing of the wound in 12 cases was delayed, and delayed union of fractures occurred in 2. The authors cannot definitely ascribe the delay of healing and union to a toxic reaction to the drug. Among the 22 simple fractures requiring an operation because of gross displacement of the fragments there were no infections. A delay in callus formation occurred in 3 and it too could not definitely be attributed to the drug. None of these patients died.

**Treatment of Shock.**—Helfrich and his co-workers gaged the efficacy of cortical extract in the prophylactic treatment of experimental shock in animals and in human beings undergoing major operations of a magnitude apt to produce shock. When cortical extract was given an hour or two before shock was produced the average drop in systolic blood pressure of the animals after forty minutes of intestinal massage was only 195 mm. contrasted with 353 mm. in animals not receiving extract prophylactically. In 15 human beings undergoing major operations of unusual duration and severity and given cortical extract prophylactically the pulse rate averaged 8 beats per minute slower and the systolic blood pressure 12 mm. higher than in 15 similar patients undergoing comparable operations but not given extract. The observations show that the extract was more effective if given prophylactically than if given after shock had developed.

**Sulfadiazine and Sulfathiazole in Pneumonia.**—Finland and his co-workers determined the antibody response in the serum of a group of 46 patients treated with sulfathiazole and another group of 48 treated with sulfadiazine. Serum was taken from these patients during and after chemotherapy and the agglutinins and mouse protective antibodies in it were tested.

against the homologous type of pneumococcus and for precipitins against the corresponding type specific polysaccharide. To none of the patients was antipneumococcus serum or vaccine administered. In almost all the patients of the two groups mouse protective antibodies developed at about the time of essential clinical recovery (the day of crisis) or later. In an occasional specimen of serum these antibodies were present as early as the fourth day of the disease, but usually they were not demonstrated until the sixth day or later. The titers of most patients increased gradually over the course of a few days, while in some they rose more rapidly. Agglutinins appeared in the serum either at the same time as the mouse protective antibodies or later. Agglutinins were never demonstrated in the absence of antibody protection, although the reverse was frequent. In general, the results of protection and agglutination tests were similar to those previously obtained in patients treated with sulfapyridine. The precipitin test with the homologous type specific polysaccharide was the least sensitive of the three tests used. Pneumococci, that is multiple organisms, of other types than I to V, VIII, XIV or XVIII, were identified in the sputum of 9 patients. In 3 of these patients agglutinins for the second type of pneumococcus were and in 6 they were not demonstrated. In addition to the 94 patients treated with sulfadiazine or sulfathiazole, 14 patients with type I, II, V or VIII pneumococcus pneumonia were given antipneumococcus serum after one to five days of treatment with sulfadiazine or sulfathiazole. Antibodies were demonstrated in the blood of only 3 of them before the first dose of antipneumococcus serum was given. However, high titers of agglutinins, precipitins and mouse protection for the homologous pneumococcus were found in the blood of the 14 patients after the antiserum was given.

**Recurrence of Pneumococcal Pneumonia**—Strauss and Finland discuss the changes in the incidence or character of one hundred and ninety-one recurrences of pneumonia among 168 patients treated at the Boston City Hospital. All the patients were more than 12 years of age, 48 were female and all but 12 were white, and the interval between the essential recovery from one attack and the onset of another varied from seven days to eighteen years. Multiple types of pneumococci were isolated during one or more attacks from 20 patients. In the one hundred and ninety-one recurrences the blood cultures of 29 patients showed pneumococci. There were 21 deaths during the one hundred and ninety-one recurrent attacks, a mortality of 11 per cent. The patients were specifically treated during one hundred and twelve recurrences with antipneumococcus serums, sulfonamide drugs (sulfapyridine, sulfathiazole and sulfadiazine) or a combination of the two. The mortality in the specifically treated group was 11.6 per cent. The mortality among the patients who had seventy-nine recurrent attacks and who were given no specific treatment was 10.1 per cent. Eight of the 29 patients who had bacteremia during a recurrent attack died, 4 of the 23 given specific therapy died, and 3 of the 5 patients not treated specifically. Five patients died of complicating diseases independent of the pneumonia. The recurrent attacks of nearly three fifths of the 48 patients who had no specific therapy for the first and specific therapy for the recurrent pneumonia were shorter than they had been in the initial infection. Among three fifths of the patients who had the benefit of specific therapy during both attacks the duration of acute illness was the same in both the initial and the recurrent attack. Of the patients who had no specific therapy in either attack, in more than 80 per cent the duration of the recurrence was the same as or shorter than that in the initial attack. A study of the frequency of recurrence as related to the type of therapy and the immunity reactions indicates that patients may have two or more attacks of pneumonia with the same type of pneumococcus, regardless of whether they receive specific or nonspecific treatment during the first attack and regardless of whether antibodies for the homologous type develop after the first attack. Recurrences ensued even though homologous antibodies were present at the time of the recurrent attack. It is impossible to correlate the immunity state with the likelihood of recurrence. Such correlation must await the accumulation of a larger body of data than is available at present.

**Chemotherapy of Pneumonia and Immunity Reaction**—Bullock and his collaborators believe that the capacity to overcome infection must be considered when the effect of different treatments is compared. Patients who recover from pneumonia without specific therapy do so by reason of their immunity response, which destroys the invading bacteria, and such patients as a rule exhibit acquired immunity to the invading organism. The response of the body to invasion by the pneumococcus is discussed and the authors show that there are immunity responses which contribute to recovery when the sulfonamide drugs are used. If the sulfonamide drugs are administered early in the disease, the pneumococci are attenuated or killed by them. Immunity is established about the same time as if the patient had had a mild infection and had recovered spontaneously. Although in most young patients, other than infants, treated early chemotherapy is sufficient to suppress the etiologic agent or to render it relatively innocuous, patients who are most severely stricken may require assistance, to them antibodies must be supplied to augment the immunity response. Moreover, when pneumococci resist chemotherapy they may respond to type specific serum therapy, and therefore specific typing and immunity study of the blood and sputum are necessary for the best care of patients. When nonspecific (for type) chemotherapy is employed, patients in whom specific antibodies develop do not require serum therapy or additional chemotherapy. In such patients, tapering off the drug is unnecessary and may be harmful. The study of C protein (the acute phase protein which may be extracted from the bodies of decapsulated and no longer type specific pneumococci) response may be of value in the diagnosis and in the treatment when it is interpreted correctly. The presence of this protein in large amount indicates that a febrile episode is due not to continued infection or complication but possibly to the chemotherapeutic agent.

**Acute Carbon Tetrachloride Poisoning**—Allison cites 2 cases of acute carbon tetrachloride poisoning, 1 in a 9 year old boy from inhalation and 1 in a man of 48, an alcoholic addict, who died ten days after drinking cleaning fluid. During the ten days symptoms and signs of extensive damage to the liver, kidneys and gastrointestinal tract were present. A necropsy confirmed the clinical manifestations. The boy had smeared red chalk on the covers of his bed, and in the process of cleaning it up with a tin of cleaning fluid he discovered that he liked the odor of the fluid and the way it made him feel. He poured a considerable amount on the blanket, replaced the tin and crawled into bed. He said that he saw stars and then couldn't remember anything. A few minutes later the boy was found under the covers, completely unconscious and breathing noisily. He was completely anesthetized for more than two hours. It is possible that there was some absorption through the skin. Definite evidence of hepatic damage occurred the next day: enlargement, tenderness and pain in the liver, a trace of bile in the urine, a high fever and leukocytosis. The importance of early intravenous administration of calcium and dextrose was not appreciated, and as the blood calcium was high calcium was given only by mouth. There was little evidence of renal damage. Hepatic tenderness persisted for two weeks and enlargement for a month. These physical signs and an evening fever, an increase in the polymorphonuclear leukocyte count and a slight elevation of the blood sedimentation rate indicated that repair was not complete in three weeks. During the next six weeks an elevation of temperature to between 100 and 101 F on slight exertion indicated continued disturbance as no other cause could be found for this fever. The author suggests the following outline for the treatment: removal of all unabsorbed carbon tetrachloride from the gastrointestinal tract; forcing of fluids by mouth and intravenously; prevention of signs of intoxication and organic damage; transfusion of blood or blood plasma if much blood has been lost; repetition of the chemical study of the blood until it returns to normal and complete rest in bed until evidence of hepatic or renal damage has disappeared. Carbon tetrachloride poisoning presents a definite health hazard. The proper labeling of products containing it should be required by law, and writers of textbooks should consider carbon tetrachloride poisoning a disease entity and thus make its nature and treatment known.

**Acromegaly and Diabetes**—Igersheimer reports what appears to be the first case of acromegaly complicated by diabetes with retinal lipemia and peculiar visual disturbances consisting in reduction of vision to perception of movements of the hand and exophthalmos. Analysis of the ocular changes suggests that two processes were going on in the pituitary-diencephalic region one was characterized by bitemporal hemianopia and was caused by the pressure of a pituitary tumor, and the other, superimposed on the first, involved central vision and the visual field as a whole and was located probably in the diencephalic region. The disturbances were favorably influenced by insulin and also by roentgen treatment.

**Metrazol in Barbiturate Poisoning**—Walker and Teague believe that since pharmacologic studies seem to support the view that the depression resulting from overdosage with barbiturates involves chiefly the hypothalamus and the basal ganglia metrazol and picrotoxin would theoretically be the analectics of choice. However metrazol seems to possess certain advantages. Chemically it is pentamethylene tetrazol. It is a stimulant almost as powerful as picrotoxin but its action is not as prolonged. There is no latent period and its maximal effect is exerted almost immediately after it is injected which practically eliminates the danger of convulsions from overdosage as with the use of picrotoxin because of its delayed peak action. The authors recently had occasion to witness the antagonism of metrazol to barbiturate. The patient's recovery following an intake of 2.5 Gm of sodium 5 ethyl 5 (1-methyl 1-butenyl) barbiturate (delivinal sodium) was rapid after other methods proved ineffective, convalescence was uneventful.

**Sneezing and Disinfection by Hypochlorites**—Bourdillon and his associates present the data of a brief quantitative study of the number of bacteria carrying particles given out during sneezing, of the rate at which the bacteria disappear from the air in a closed room and of the rate at which they are killed by sodium hypochlorite sprayed into the air with a hand spray. Fifteen tests in a closed room revealed that an average vigorous sneeze causes the emission of about 100,000 bacteria carrying particles of a size small enough to remain in the air for more than one minute. Of these about 4 per cent will usually remain suspended in still air for as long as thirty minutes. All or almost all the bacteria thus emitted can be killed in three to four minutes by a spray of a 1 per cent solution of sodium hypochlorite in a concentration of 2 l cc per thousand cubic feet of air. Under certain unfavorable conditions such as low relative humidity or a high content of organic matter in the air, the action of the hypochlorite spray may be hindered.

**Procaine Infiltration for Fibrositis**—Moynahan and Nicholson subjected more than 80 patients with fibrositis to infiltration of the painful areas with procaine hydrochloride. Only 6 patients failed to obtain relief or cure, in all but 1 of whom the diagnosis was erroneous, 3 had osteoarthritis of the spine, 1 sacralization of the fifth lumbar vertebra and 1 a severe dislocation of the acromioclavicular joint, with fracture of the acromial end of the clavicle, which was mistaken for a deltoid fibrositis. The sixth patient had fibrositis of the shoulder girdle and left arm with no definite tender spots, and 'blind' infiltration failed to relieve the condition. After the tender spots are determined by digital palpation they should be marked on the

skin, and after the skin is cleansed a wheal should be raised by injecting a small quantity of procaine hydrochloride over the site of the lesion. The needle should be driven down until a tender spot is reached and then 2 to 3 cc of the solution should be injected. The injection gives immediate relief from pain and any associated tenderness or muscular spasm disappears. A dental syringe and needle are probably best suited for the infiltration. Some patients experience a return of pain a few hours after the injection, but this pain usually wears off in a few hours. The patient should be encouraged to move the affected part freely and to carry on with his normal occupation. Usually one injection suffices. Every tender area should be infiltrated and the pain eliminated completely at the first sitting.

**Neonatal Thrush in Maternity Hospital**—Ludlam and Henderson point out that the high incidence of thrush found on routine clinical examination of the infants in a maternity hospital was increased when accompanied by bacteriologic examination. The incidence was much higher among bottle fed infants and among those who were in the hospital a long time. The factors account for the extremely high incidence of thrush in premature infants. There was no evidence that local trauma, debility or prematurity predisposed to thrush. The causative organism, *Monilia albicans*, can be isolated several days before lesions become visible, and it usually persists after the lesions disappear. Therefore isolation must continue until discharge unless a negative swab has been obtained. *M. albicans* can be isolated from the feces of most infected infants and also from the hands of 50 per cent of them. There was no significant relationship between the vaginal infection of a mother and infection in her infant. *M. albicans* was isolated from the finger of a third of the nurses and was found on the finger of a third. The organism was found in samples of pooled breast milk for bottle fed infants. The incidence of thrush fell to 1 per cent after such milk was heated. The principal cause of the incidence were overcrowding in the nurseries, failure to prevent spread from infant to infant and failure to make an early diagnosis with its consequent isolation and treatment.

**Cause of Torsion of Pedicle in Ovarian Tumors**—von Wattenwyl reviews the classic theories of the cause of torsion of ovarian tumors. Analysis of 59 cases of ovarian tumors with twisted pedicle and comparison with ovarian tumors without torsion demonstrate that none of the theories heretofore advanced alone explain all cases and that the patient's age and number of deliveries and the form size and histologic characteristics of the growth cannot be of essential importance in the twisting of the stalk. On the phantom and in animal experiments torsion of the pedicle can be artificially produced if certain positions are produced, but no new theory can be deduced from this nor can it serve as proof of the validity of one of the former explanations. Sellheim's theory is rejected on the basis of clinical analyses and experiments. The influence of changing vesical and rectal filling on the position of the tumor and in the pathogenesis of torsion of the pedicle was demonstrated in a phantom experiment. However influence of peristalsis could not be demonstrated in animal experiments and the role of hemodynamic factors remains undecided. Torsion of the pedicle apparently takes place only when several favoring factors develop at the same time. This explains its relative rarity.

## Dia Médico, Buenos Aires

14 33-52 (Jan 19) 1942 Partial Index

- \*Clinical Symptoms and Roentgen Signs of Malignant Tumors of Bone—O Copello—p. 3

**Clinical Symptoms and Roentgen Signs of Malignant Tumors of Bone**—Copello made observations on 60 patients with malignant tumors. Local pain tumor and dysfunction of the involved limb are common to all malignant tumors of bone. Malignant osteoblastoma and osteogenic sarcoma develop from bone cells of osteogenic tissues of bone in patients between the ages of 15 and 25. Tumors of these types are rare after 50. Persistent local pain may be the only symptom for a long time. The tumor is solitary. A local venous network is formed and the temperature of the local skin is increased. Edema is observed in cases of advanced tumor. The tumor develops preferably in the metaphysis of the long bones especially the femur and the tibia. The patients live in a relatively good condition for a long time. Fever, leukocytosis and pathologic fractures are rare. Metastasis to the lung and to other bones develops early in the course of the disease. The tumor appears in the roentgenogram as a round or fusiform shadow. Bone changes are typical of osteolysis of osteogenic reaction of the tumor and of the cortex and destruction of bone. Reticulosarcoma of Ewing's type develops from bone cells of reticulo-endothelial tissue of bone in patients between 10 and 30 years old. The solitary tumor appears early in the course of the disease develops rapidly and forms metastases in bones. Pathologic fractures occur in 40 per cent of cases. Fever and leukocytosis are frequent. The general condition of the patient deteriorates and the weight rapidly diminishes. The two main types of roentgen changes are osteolytic and the reactional osteogenic. Myeloma develops from bone cells of the hemopoietic tissue of the bone. The tumor is either multiple or generalized. It develops in persons between the ages of 30 and 48. The thoracic bones are the ones most frequently involved. Osteogenesis is not produced. Pathologic fractures occur in 62 per cent of the cases. Destruction of bone is the cause of various thoracic deformities with consequent bronchopulmonary disease. Renal complications occur. Roentgenograms show multiple or generalized osteolysis and destruction of the cortex of bone similar to the changes due to general metastases of other tumors. Medullary fibrosarcoma develops from bone cells of the connective and vascular tissues of bone in patients between

the ages of 30 and 50 years. Any bone may be involved. The femur is the seat of predilection. The disease is more frequent in women than in men. The tumor is large and painful to pressure. Pathologic fractures are frequent. The tumor gives rise to early metastasis by way of the blood.

- \*Campaign Against Tuberculosis and Children's Homes R Navarro Gutierrez and R Martinez Alvarez—p. 531

**Limited Costal Resection in Ineffective Pneumothorax**—Buñlla and Garcia Alonso present the history of a woman aged 24 with severe ulcerative tuberculosis of the upper lobe of the right lung. Artificial pneumothorax proved ineffective because of extensive inoperable posterior adhesions which kept a large cavity open. Extrapleural pneumonolysis was considered dangerous because of the type and localization of the cavity. Phrenic exeresis would probably not have had a beneficial effect because of the high parietal localization of the cavity. Abandonment of the artificial pneumothorax was regarded as a poor solution. Limited costal resection in the zone of adhesions seemed to be the only treatment from which closure of the cavity might be expected. The operation was relatively well tolerated and was followed by rapid improvement of the clinical symptoms with immediate reduction in the volume of the cavity. In spite of the early appearance of an exudate which necessitated premature abandonment of the therapeutic pneumothorax, the patient was clinically and roentgenologically cured twenty-two months after the operation. Examination for bacilli gave negative results. Limited costal resection in the zone of pulmonary adhesions, employed with the aim of completing an ineffective pneumothorax, deserves consideration when other complementary or substitutional treatments are impossible.

**Campaign Against Tuberculosis**—Navarro Gutierrez and Martinez Alvarez stress that an open tuberculous lesion is the chief focus of infection and that the isolation of the patient is therefore of primary importance. They discuss the danger of conjugal infection and the possibility that parents may become infected by tuberculous children, but they regard the danger for children particularly young children, as being much greater if the parents have open tuberculosis, in which case it will often be more economical and more effective to remove the children than the patient. It is suggested that children in poor homes where the mother has open tuberculosis and eliminates tubercle bacilli should be placed in the children's homes of the Auxilio Social (social aid).

## Geneeskundig Tijdschr v Nederl-Indie, Batavia

81 2573-2620 (Dec 2) 1941

- Autoregulation of Blood Pressure A de Waart—p. 2574
- Detachment of Torpid Cuts of Possible Tuberculous Etiology Caer R Kornel Singawinata—p. 2593
- \*Chondroma of Scapula L P van Lelveld—p. 2601

**Chondroma of Scapula**—According to van Lelveld, chondroma is comparatively rare and the localization in the reported case is an exception. A Javanese aged 25 came to the hospital with a painful swelling which had existed in the middle of the left scapula for about two years. Roentgenoscopy disclosed bony tissue and an exploratory excision revealed an osteochondroma. The growth was connected to the surrounding muscles, which had to be removed in part. The postoperative course was normal and the patient was discharged without complaints. The surgical specimen measured 11 by 8 by 6 cm. Sectioning disclosed chiefly cartilage with here and there inclusions of bone tissue of which it could not be ascertained whether they were originally bone or ossified chondroma.

## Book Notices

**The 1941 Year Book of Industrial and Orthopedic Surgery** Edited by Charles F. Palnter M.D., Orthopedic Surgeon to the Massachusetts Women's Hospital, and Beth Israel Hospital Boston. Cloth. Price, \$3. Pp. 432, with 353 illustrations. Chicago: Year Book Publishers Incorporated, 1941.

It is not often that a doctor gets so much for so little. This applies especially to general practitioners and to industrial, traumatic and military surgeons. The best of the leading articles of the year have been selected by the editor and have been abstracted. Some of the two hundred and twenty-two contributions include locking wrist, arthritis, emergency fracture treatment, industrial medicine, differential diagnosis of low back pain, treatment of war wounds of limbs and war burns, treatment of painful feet, four essential points in immediate care of industrial injuries, five principles of management of hand infections, gout, fractures of the forearm and elbow in children, scalenus anticus syndrome, first aid for injuries to the knee and spinal column, special splints for the fingers and thumb, treatment of acute osteomyelitis in children, technic of pedicled flaps for skin plastics, early diagnosis of tuberculosis of the knee in young adults, conservative surgery and roentgen therapy of benign and malignant bone tumors.

**Woman's Personal Hygiene: Modern Methods and Appliances** By Conna W. Chalmers. Foreword by Winfield Scott Pugh, B.S., M.D. Drawings by Alfred Feinberg. X-rays by Winfield Scott Pugh, M.D. Photographs by Tom Rodd. Cloth. Price, \$2. Pp. 192, with 32 illustrations. New York: Pioneer Publications Inc., 1941.

This book was prepared by a lay woman, the wife of a physician, as an educational contribution for the enlightenment of all women, especially from the point of view of sex health. The subjects discussed are the anatomy of the female pelvic organs, the glands of internal secretion, displacements of the uterus, dysmenorrhea, leukorrhea, venereal disease, vaginal hygiene, vaginal douches, postpartum exercises and marital relations. At the end of the book is a list of "don'ts," with some of which the reviewer disagrees. The author says "Don't fail to take an occasional douche, regardless of your excellent health. Douches are refreshing and most women need a 'vaginal cocktail' at least twice a week." This surely is not sound advice. Furthermore, the author says "Don't put off visiting your doctor if you have any pelvic displacements." How is the patient to know about her displacement and, even if she has one, does this always or even usually call for treatment? Also "Don't fail to keep the genitals immaculate at all times." This is a peculiar use of the word "immaculate." On the whole the advice given is excellent. The author quotes a number of leading American authorities throughout the book and gives a bibliography. The language is clear and there are many illustrations which greatly enhance the text.

**Allergy in Clinical Practice** By Staff Members of the Cleveland Clinic. Under the direction of Russell L. Haden M.D., F.A.C.P., Chief of the Medical Division. Edited by J. Warlick Thomas M.D., F.A.C.P., Chief of the Section on Allergy. Fibroid. Price \$5. Pp. 354, with 92 illustrations. Philadelphia: Montreal & London: J. B. Lippincott Company, 1941.

A passage from the introduction well describes the purpose and the scope of this volume. This book has been prepared primarily to illustrate the role of allergy in the production of disease in man. A specialist in each field in which allergy is applicable has evaluated this principle in his field, which seems to be much more desirable than the allergist to evaluate the role of allergy in some other specialist's field.

After the introduction and general discussion on the allergic approach the book devotes a chapter each to bronchial asthma, hay fever, perennial nasal allergy, allergic bronchitis, bronchiectasis, contact dermatitis, atopic dermatitis, drug eruptions, fungus allergies, urticaria, gastrointestinal allergy, ocular manifestations, allergic headaches, endocrine considerations and miscellaneous manifestations. The problems of diagnosis receive proper consideration, and the importance of an adequate and complete history in all cases of allergic disease is emphasized, as rightly should be done. The necessity for careful differential diagnosis before an allergic investigation is undertaken and the

search for coexisting disease of a nonallergic origin requires, according to the authors, cooperation between the allergist and various specialists.

Treatment for each condition is outlined in a general manner, and then a number of detailed case histories are used to illustrate each disease that has been discussed. These case histories represent nearly 50 per cent of the subject matter of the book. The cooperation in treatment, as in diagnosis, of specialists in different fields is set forth as the ideal means of serving the best interests of the allergic patient.

The details of allergic examination, such as preparation of antigens, skin testing and numerous other details of procedure, are omitted, as they should be in a book of this nature. Hypo-sensitization is dealt with briefly in the chapter on hay fever.

Preference is expressed for the perennial type of treatment of this condition. It is gratifying that the authors do not deal with procedures of questionable merit or unproved therapeutic value, many of which have received more or less prominence in recent years. There are, however, some statements that should not go unchallenged, of which the following one, in reference to allergic conjunctivitis, is an example: "Among the inhalant factors, dust, feathers, molds, tobacco smoke and ashes, pollens and animal epidermals must be considered as etiologic suspects." There is no evidence in the literature that tobacco smoke or ashes can be more than mechanical irritants, and certainly they cannot be primary etiologic agents.

This book is written by clinicians, it is not a highly scientific work, nor does it bring out any particularly new ideas. It does serve to bring to the attention of readers who have not followed the rapid strides which allergy is making that allergy may be a factor in diseases other than hay fever and asthma. It should make its readers in general alert to consider an allergic basis in the differential diagnosis of many obscure conditions. There are numerous helpful illustrations throughout the text.

**Diseases of Women** By Harry Sturgeon Crossen M.D., F.A.C.S., Gynecologist to the Barnes Hospital, St. Louis, and Robert James Crossen, A.B., M.D., Assistant Professor of Clinical Gynecology and Obstetrics, Washington University School of Medicine, St. Louis. Ninth edition. Cloth. \$12.50. Pp. 948, with 1,127 illustrations. St. Louis: C.V. Mosby Company, 1941.

This textbook of gynecology is remarkable for its excellent illustrations. Apparently the senior author has been collecting sketches and figures ever since his first edition thirty-four years ago. As a result, the present edition depicts the technique of vaginal examination with a series of plates which is perhaps unequalled. These are accompanied by a detailed description of the manipulations essential to accurate diagnosis. If pelvic diagnosis can be taught by a book, this is the book to do it. In other respects also the work is excellent. Many handsome colored plates have been borrowed from the literature of pharmaceutical houses, and many nearly perfect photographs in color have been secured from other sources. The section on endocrinology has been brought up to date, even though momentarily. References are easily found in a section of twenty-four pages at the end of the book. The main volume of material is what may be expected in a standard textbook of gynecology. No additional commendation is necessary. As a medical book passes through many editions, it often suffers more from what is retained than from what is added. This fine work is no exception, much could be compressed, much omitted. It is not easy for the surgeon to place his book under the scalpel.

**A Text Book of Neuro-Anatomy** By Albert Kuntz, Ph.D., M.D., Professor of Micro-Anatomy in St. Louis University School of Medicine, St. Louis. Third Edition. Cloth. Price, \$6. Pp. 518, with 307 illustrations. Philadelphia: Lea & Febiger, 1942.

This excellent work contains the same number of illustrations as before but some of them are new. All the practical features of the second edition are retained. The newer studies of the diencephalon are included. Microscopic studies of the cerebral cortex have been added. Twenty-six chapters comprise the contents, beginning with the evolution and comparative anatomy of the nervous system and concluding with a laboratory outline. The author expresses himself with clarity and interest. The book is written concisely and should be in the library of every medical man interested in neurology.

## Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT HOWEVER REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS BUT THESE WILL BE OMITTED ON REQUEST.

### COMBINED DIPHTHERIA AND WHOOPING COUGH IMMUNIZATION

To the Editor—Please advise me regarding the efficacy of combined diphtheria and whooping cough serum. Is use of this form preferable to the old method of giving separate immunization?

Alfred H. Hathcock, M.D., Fayetteville, Ark.

ANSWER—Although a few preliminary reports on the injection of a mixture of pertussis vaccine and diphtheria toxoid for the simultaneous prevention of whooping cough and diphtheria have recently appeared, sufficient time has not elapsed for clinical evidence to prove that protection against whooping cough has thus been conferred.

It seems premature to recommend to physicians in private practice the use of any of the products so far proposed. Carefully controlled clinical studies, covering a period of years, should ultimately decide whether such simultaneous immunization will confer prolonged immunity. The reactions to mixed or so-called combined antigens, especially those made with alum, is more severe than that which ensues when the antigens are injected singly.

### SIGNIFICANCE OF THE DEXTROSE TOLERANCE TEST

To the Editor—For a patient with chronic weakness and lassitude what significance have the following results of the dextrose tolerance test obtained after 100 Gm of dextrose has been given by mouth?

|         | Blood Sugar | Urine |
|---------|-------------|-------|
| Fasting | 90          | —     |
| 1 hour  | 63          | —     |
| 2 hours | 94          | —     |
| 3 hours | 80          | —     |
| 4 hours | 76          | —     |
| 5 hours | 75          | —     |
| 6 hours | 78          | —     |

L. A. Crowell Jr., M.D., Lincoln, N.C.

ANSWER—In recent discussions (Lepore, M. J. Clinical Significance of Low or "Flat" Oral Glucose Tolerance Curve, *Ann Int Med* 14 2008 [May] 1941; Lepore, M. J., and Golden Ross, A Syndrome Due to Deficiency of the Vitamin B Complex, *THE JOURNAL*, Sept 13, 1941, p. 918) the known causes of a low or "flat" oral dextrose tolerance curve have been classified as follows: (a) poor or slow absorption of dextrose from the digestive tract, (b) rapid removal of dextrose from the blood stream and (c) combinations of a and b. Among the diseases mentioned are sprue, malnutrition, vitamin B deficiency states, celiac disease, tuberculosis of the small intestine, tumors of the small intestine, hyperinsulinism, previous high carbohydrate diet, Addison's disease, hypopituitarism including Simmonds' disease, hypothyroidism and renal glycosuria. The reader is referred to the articles cited for a full discussion.

With the patient in question one wonders as to the validity of the figure of 63 mg. per hundred cubic centimeters at the one hour interval. It seems inconsistent with the other values obtained.

Inspection of the values rules out certain of the diseases mentioned. The relatively normal fasting value and the fact that the six hour value is no lower than 78 mg. are against hyperinsulinism due to an islet cell tumor. The absence of glycosuria except in one specimen rules out renal glycosuria. Not enough clinical and laboratory data are furnished to enable one to analyze the situation further, but with the possibilities outlined kept in mind the analysis may be possible. Prominently to be considered are vitamin B deficiency and the endocrinopathies listed.

It would be well worth while to repeat the test at first giving the dextrose orally and then, on a second occasion a week later, intravenously. It must be emphasized that the results of a dextrose tolerance test are influenced by many variables and must always be interpreted with caution and with regard to clinical findings.

### SAKE, JAPANESE RICE WINE

To the Editor—Please give me information as to sake (Japanese rice wine) from a clinical point of view. I refer more particularly to any harmful (or beneficial [?]) effects it may have of an unusual or specific sort as compared to other strong alcoholic beverages. For example, does it conduce to alcoholic polyneuritis more than other alcoholic drinks of more or less equal alcoholic content (it has 17 per cent plus)? In the medical library here and in the city's public library I have not as yet been able to find any information at all of a clinical nature and no references to it even in the indexes of volumes on toxicology, legal medicine and the like. All other books even mentioning sake are rather brief and incomplete as to any information.

H. Otto Sommer, M.D., Denver

ANSWER—The following information has been taken from Edward R. Emmerson's "Beverages, Past and Present," *Chemical Abstracts* and other sources.

The Japanese beverage sake is unique in character, since it is not beer, wine or brandy, but it resembles all three and is often spoken or written of as rice beer, rice wine or rice brandy. Authentically, sake was introduced into Japan about the fourth century. The name seems to be derived from the city Osaka. It is yellowish white and has an acidulous, sherry flavor. It is high in alcoholic content, running 12 to 17 per cent by volume. Sake is the national beverage of Japan and has spread over our Western states through Japanese immigrants. The drink is served in porcelain cups and consumed at body temperature. It is made by Emil Sick of the Lethbridge Brewing Company, Lethbridge, Alberta, Canada.

The mode of preparation varies, but the principal steps are as follows. A culture of a ferment or enzyme (fungus mold) called koji is prepared by growing on rice medium. Hulled rice is washed with fresh water until the water runs off clear. The last water remains on the rice and is steamed to gelatinize the rice and prevent it from sprouting. The soft material is spread on straw mats to cool. At blood temperature this medium is seeded with fane-koji, a sporadic growth of fungus (fane meaning seed) and thoroughly mixed. After several days, during which time the material assumes a less viscous state, the mash is prepared. This consists of 10 parts of rice, 4 parts of koji ferment and 12 parts of water, all taken by weight. The mixture is kept at favorable temperatures for fermentation, and in about fourteen days this is completed. The material is now ready to be filtered under pressure and the turbid liquor is placed in a vertical cask for clarification. After several months the product is ready for consumption. Sake is made during the cold months of the year.

The literature has little on the subject of vitamins in sake. The occurrence of vitamin B in sake and sake-kasu (pressed cake) was investigated by Inukai, Higashi and Nakahara (*Scientific Papers, Institute of Physicochemical Research, Tokyo* 24 113, 1934). Animal experiments described in this paper demonstrate that sake-kasu and raw sake are good sources of the growth promoting vitamin B. The antineuritic vitamin B<sub>1</sub> does not seem to be contained in these fermentation products. A striking difference was found between the bottled sake on the market and the raw sake before the "hite" treatment (heating to stop further fermentation). The difference probably is due to the fact that sake producers treat sake with animal charcoal in order to decolorize the commercial product with the resultant removal of the growth promoting vitamin.

Since the manufacture of sake is somewhat similar to that of beer, it may be assumed that the vitamins in the two products share a similar fate. In beer it is known that thiamine is destroyed to the extent of over 90 per cent during the process of fermentation, so that 100 cc. of beer contains but 1 international unit or about one three-hundredth of the daily requirement of this vitamin. It may therefore be assumed that sake would have the same relationship to polyneuritis that vitamin free beverages of the same alcoholic strength would have.

### GREEN SWEAT

To the Editor—A machinist aged 35 whose present work entails considerable drilling of iron castings at relatively high speeds perspires moderately with a material that stains his underclothing green. Information relative to this condition will be greatly appreciated. Would working in bronze produce any different reaction?

M.D. Ohio

ANSWER—It would be of interest to know whether the perspiration itself of this workman as well as the fabric of the underclothing, is actually greenish and whether the color occurs in the perspiration from all parts of the body. It would be of interest to know also the duration of the coloration if it existed before the present job and if it occurs only during the working period or during week ends or vacations on vigorous exercise. Certain persons have a brownish reddish or even a faint vel-

lowish color to the axillary portion of the underclothing caused by masses of chromogenic bacteria attached to the hairs in that region. Cases of true chromidrosis have been reported rarely. Green sweat supposedly from the ingestion or absorption of copper has been seen in a few cases, and in 1 case blue chromidrosis was presumed to be due to the iron the patient had been taking. The standard works on occupational dermatoses do not cite any cases of green coloration from perspiration in connection with iron or steel workers, but reference is made to a greenish discoloration of perspiration among workers exposed to bronze dust. If the inquirer's patient has a true green chromidrosis it would be of great interest from the physiologic point of view to attempt to work out the etiologic factors.

#### HEALTH HAZARDS IN PEARL BUTTON INDUSTRY

**To the Editor**—A woman aged 35 has had a persistent cough and frequent head colds for ten months and has lost 27 pounds (12 Kg) during the last twelve months. She works in a pearl button factory at feeding a machine which bores holes and grinds buttons and creates considerable dust. A roentgenogram of the chest showed no evidence of tuberculosis. The sinuses are clear except for acute coryza. There are no evidences of other diseases. I should like to know if the dust from the pearl buttons (made from mussel shells) could have any significance in this case. **W B Wilcoxon, M D, Bowling Green, Mo**

**ANSWER**—In 1920 Birge and Havens published an article on health hazards in the pearl button industry (*J Indust Hyg* 2:81 [July] 1920). They reported that the general health of employees was good at that time but that "catarrhal conditions" were extremely common. The rooms where buttons were bored and ground were equipped with an exhaust system, but there was still a good deal of dust.

No roentgenograms were made, but physical examination revealed no more tuberculosis than was present in the population of the community. Contrary to the general impression, infections of the hand and osteomyelitis of the bones of the hand and forearm were not discovered. Rheumatism and indigestion were common complaints.

From the data available it is difficult to imagine the cause of the symptoms described in the query.

#### EFFECT OF MERCURY VAPOR LAMPS ON THE EYE

**To the Editor**—I should like to know if there is any evidence that mercury vapor lamps, as used for industrial lighting, cause any symptoms of eye irritation or disturbances of vision. If there is no direct effect on the eyes, would the distortion of colors (of manufactured parts, such as various colored cables) be a source of eye irritation or visual disturbance?

**H W Garton, M D, Fort Wayne, Ind**

**ANSWER**—Mercury vapor lamps, when the rays are directed into the eye, can cause an irritating conjunctivitis and superficial punctate keratitis. The lights used industrially, however, are usually very high and of insufficient intensity to cause irritation to the average person. A light-complexioned individual is more susceptible to such rays than a brunet type. It is unlikely that working on colored objects under colored light would be any additional source of irritation. Exposure without the use of goggles for a long time to the rays from colored vapor lamps, in the form of the so-called sunlight lamps, produces a superficial punctate keratitis of varying degrees, depending on the length of exposure, and can even cause permanent visual disturbance by opacities of the cornea.

Basil Graves cites such a case in "The Eye and Its Diseases" by Behrens, and Duke Elder, in his "Advances of Ophthalmology" (Philadelphia, P Blakiston's Sons & Co, 1934), describes the pathology of this condition.

#### INTRAVENOUS MERCUROCHROME FOR UNDULANT FEVER

**To the Editor**—Intravenous mercurochrome therapy is commonly used here for infections of the blood stream. I was criticized for not using it in a case of acute undulant fever. What is the present status of the intravenous mercurochrome treatment of acute undulant fever or of any infection of the blood stream?

**M D, New York**

**ANSWER**—Evidence that intravenous administration of mercurochrome significantly modifies the course of brucella infections has never been presented, beyond an occasional, and sometimes striking, immediate clinical improvement. When improvement has occurred a causal relationship has not always been clear, and recorded postrecovery observation periods have been so short that claims of recovery or cure cannot be substantiated. The treatment is not entirely safe. Chills, hyperpyrexia, vomiting, abdominal pain, diarrhea and albuminuria are frequent side effects. Complete anuria has resulted.

For most of the commonly encountered septicemic infections chemotherapy with an appropriate sulfonamide derivative is safer and demonstrably far more efficacious than mercurochrome therapy.

#### RETINITIS PROLIFERANS

**To the Editor**—I should like information on the latest methods of therapy for retinitis proliferans.

**R H Kuhns, M D, Los Angeles**

**ANSWER**—Retinitis proliferans is a complication of general disease, such as diabetes, inflammations or injuries, or is due to hemorrhage of the retina and vitreous. The treatment therefore depends to some extent on the cause.

In the diabetic form, of course, general treatment is indicated. In the inflammatory form, Dugan advises foreign protein therapy, nitrites intravenously and by mouth. Potassium iodide internally is the old standard treatment, and high doses of vitamin C with vitamin B complex may be used in this condition regardless of the cause. Subconjunctival injections of sodium chloride are used by some, and ethylmorphine hydrochloride applied locally in the conjunctival sac is advised by others. Such local applications are of doubtful value.

Prognosis is poor, and treatment is most often without avail.

#### HYDROTHORAX IN CONGESTIVE HEART FAILURE

**To the Editor**—Is there an explanation for the development of hydrothorax in congestive heart failure in the right side of the chest so much more frequently than in the left side?

**M D, Utah**

**ANSWER**—There is not as yet any proved explanation as to why hydrothorax in congestive heart failure is so much more frequent on the right side than on the left. A likely answer is based on the anatomic configuration of the venous return of blood from the pleural cavities. On the right side drainage is by way of the vena azygos major directly into the superior vena cava, when the latter is badly congested in right heart failure the vena azygos is quickly blocked. The left pleural cavity largely drains via the vena azygos minor, which usually empties into the left innominate vein and so is not so immediately obstructed as is the vena azygos major. There may be also, however, another factor involved in the pulmonary circulation per se, consisting of a freer return of blood into the left auricle from the left lung than from the right. More study of this interesting problem is needed.

#### DESENSITIZATION AGAINST ERYSIPELAS

**To the Editor**—A man aged 45 has had frequent attacks of erysipelas which always start on the outside of the left leg. Between the attacks there are no visible cutaneous lesions which could serve as entrance for the infection. The condition reacts promptly to sulfonamide therapy. Is there any possibility that the patient could be desensitized? Have you any other suggestion for preventive treatment?

**M D, New York**

**ANSWER**—It is possible to produce a higher protective immunity to erysipelas by subcutaneous injections of erysipelas toxin. Most important is treatment of epidermophytosis or any nidus of infection which may provide a focus for the intermittent spread of erysipelas.

#### USE OF PRESSURE COOKER FOR STERILIZING

**To the Editor**—In connection with the last paragraph of the answer (*The Journal*, Feb 28, 1942, p 770) which states "Since pressure cookers are not equipped for drawing a vacuum at the conclusion of sterilization bandages and wrappings will be slightly moist when the cooker is opened, and should be immediately dried by a moderate heating in an oven," I suggest that a sufficiently low moisture content is produced in bandages and wrappings for immediate use if the operator removes the vent weight on conclusion of the sterilization period. It must be remembered that when the temperature drop leads the pressure drop the result is condensation and moisture, however, when the pressure drop leads the temperature drop the result is evaporation. The rapid dropping of pressure will cause most of the moisture trapped in the bandages and wrappings to boil off vigorously. **Alfred Vischer Jr, 412 Orleans Street, Chicago**  
**Vischer Products Company**

**To the Editor**—Your correspondent states (*The Journal* Feb 28, 1942, p 770) "Since pressure cookers are not equipped for drawing a vacuum at the conclusion of sterilization, bandages and wrappings will be slightly moist when the cooker is opened and should be immediately dried by moderate heating in an oven." It is, however, easy to create a vacuum in them at the end of autoclaving and to obtain dry sterilized goods. After the desired time of pressure sterilization has elapsed, one turns off the heater, opens the steam valve and lets the steam blow off until the pressure has fallen to zero. Then one closes the valve, removes the cooker from the heater and places it in a pan or sink filled with cold tap water. This will bring condensation on the bottom and will create a vacuum. After a few minutes cooling, the valve is opened and air is permitted to enter the cooker until the air flow stops. Then the cooker is opened and the sterilized goods will be found dry. It is not advised to cool the lid of the cooker also, as this would lead to water precipitating on its inside and the droplets might fall and wet the goods.

## IRRADIATED ERGOSTEROL POISONING

REPORT OF TWO CASES

PHILIP A. TUMULTY, M.D.  
AND

JOHN EAGER HOWARD, M.D.  
BALTIMORE

During the past five years there have been an increasing number of clinical reports regarding the use of massive doses of vitamin D in the treatment of rickets, tetany, rheumatoid arthritis and various allergic states.<sup>1</sup>

We shall make no attempt to evaluate the therapeutic efficacy of vitamin D or its concentrates in these conditions but shall rather put out a suggestion of caution regarding the possible ill effects that may follow, under certain circumstances at least, the employment of massive doses of the vitamin.

That vitamin D and the irradiated sterol concentrates may produce toxic reactions has been recognized for many years. Numerous writers have described the occurrence of anorexia, loss of weight, nausea, vomiting, abdominal pain, diarrhea, muscular weakness, headaches, polyuria and polydipsia in both man and animals. Acute intoxications in animals have resulted in coma and death.<sup>2</sup> Only two or three deaths have been described in man. These will be referred to later. It is of interest that most of the patients who have been given massive doses of vitamin D have shown only minor evidences of intoxication and it is perhaps for this reason that the more severe consequences of massive therapy have not been appreciated. Thus McLean<sup>3</sup> says "the dangers of the toxic effects of these substances, while real, have been somewhat overemphasized," and Steinberg<sup>4</sup> echoes him.

It is thus to encourage an attitude of respect for the potential dangers which may lie in the employment of large doses of ergosterol, under certain circumstances

at least, that we present these 2 cases in which a major manifestation of ergosterol intoxication of a serious nature was a prominent and interesting feature.

### REPORT OF CASES

**CASE 1—History**—J. W., a white man aged 22, was admitted to the medical service of the Johns Hopkins Hospital on July 23, 1941. The history revealed only the usual childhood diseases. The system review was entirely negative. He had never had urgency, frequency, nocturia, hematuria or oliguria. He stated that he had never had venereal disease. He was employed in an airplane factory and had never been exposed to any toxic agents. On July 2 he had been struck by an automobile and had fractured his left femur and left clavicle. His leg was immobilized in traction and on July 8 he was given a large dose of a preparation of ergosterol containing 50 per cent calciferol and 50 per cent of a mixture of lumisterol, tachysterol and toxysterol. During the succeeding twelve days he received approximately 750,000 international units of the preparation daily. This medication was frequently given in a glass of milk. Throughout this period he ate a diet which contained 15 to 2 Gm. of calcium daily. At the end of twelve days the patient complained of nausea followed by abdominal pain and later of vomiting, which became almost intractable. At this time the urine was examined and found to contain many hyaline casts and red blood cells. It is significant to note that urine examinations prior to the administration of vitamin D were entirely normal.

He was therefore admitted to the medical service, where the physical examination was essentially negative but for a fractured left femur and left clavicle. Blood studies showed red blood cells 3,730,000, hemoglobin 85 Gm, hematocrit 33 per cent volume of packed cells and white blood cells 7,600, with a normal differential count. The anemia was thought to be due to blood loss at the time of the accident. On admission the urine had a specific gravity of 1.006 and contained no sugar or albumin. The sediment showed red blood cells 1 to 2, white blood cells 1 to 2 and numerous hyaline casts. The Sulkowitch test for hypercalciuria was 4 plus. Chemical examination of the blood revealed a serum calcium level of 15 mg. per hundred cubic centimeters, serum phosphorus 38 mg. per hundred cubic centimeters, blood nonprotein nitrogen 52 mg. per hundred cubic centimeters and serum carbon dioxide combining power 72.7 volumes per cent. Chart 1 illustrates the subsequent course of events.

**Course**—Fluids were forced and the patient was provided with a low calcium diet (0.2 Gm. of calcium intake daily). Nausea, vomiting and abdominal pains disappeared on the second day and he remained symptom free thereafter.

Attention is called to the prolonged elevation of the blood calcium. It is interesting to note that there was no concomitant depression of the blood phosphorus. A transient degree of renal impairment accompanied the hypercalcemia. This was evidenced by the elevation of the blood nonprotein nitrogen and the depression of the phenolsulfonphthalein and urea clearances. We should like to suggest, however, that this functional impairment was not by any means entirely transient despite the rapid return of the phenolsulfonphthalein and urea clearance to normal values, for even after weeks had

passed the patient still could not concentrate his urine above 1 020. This we believe is evidence of continued and significant renal damage. Throughout this entire period the daily urinary output was 1,200 to 2,000 cc. After the first five days the urinary sediment was entirely clear. The blood pressure was never elevated above 120 systolic and 80 diastolic. The electrocardiogram remained normal. X-ray examination showed no calcium in the kidneys or other tissues and no osteoporosis. Biopsy of the sternum on August 5 showed normal bone marrow. Six months after the accident the fracture had not yet healed and orthopedic consultants felt that there was delayed healing and poor callus formation.

**CASE 2—History**—W. S., a Negro aged 22, was admitted to the medical service of the Johns Hopkins Hospital on July 25, 1941. His general health had been excellent and he had never had any serious illnesses. He did not have nocturia, hematuria, dysuria or frequency. On June 30 he was struck by an automobile and sustained a compound fracture of the left tibia and fibula and also of the lower end of the left femur. The leg was put in traction and a cast applied. On July 8 he was started on approximately 750,000 international units daily of a preparation of irradiated ergosterol containing 50 per cent calciferol and 50 per cent lumisterol, tachysterol and toxisterol. This preparation was frequently given in milk. On July 25 he was taken with nausea and vomiting. The diagnosis of irradiated ergosterol intoxication was suggested and he was admitted to the medical service at this time. Physical examination revealed no abnormalities other than the fractures. On admission examination showed red blood cells 4,800,000, hemoglobin 12 Gm., hematocrit 35 per cent volume of packed cells, white blood cells 7,450. On admission the urine had a specific gravity of 1.005 and contained no sugar or albumin. There was an occasional white blood cell and cast. There were no red blood cells. Chemical examination of the blood revealed a serum calcium level of 18 mg. per hundred cubic centimeters, serum phosphorus 2.9 mg. per hundred cubic centimeters and blood nonprotein nitrogen 47 mg. per hundred cubic centimeters. Chart 2 illustrates the patient's subsequent course.

**Course**—Fluids were forced and the patient was given a diet containing approximately 0.2 Gm. of calcium daily. In twenty-four hours the nausea and vomiting subsided and he remained symptom free.

Chart 1—Observations in case 1

One is struck by the remarkably prolonged elevation of the serum calcium. As in the first case the phosphorus was not reduced in the presence of hypercalcemia but remained at a normal or slightly elevated level. Azotemia was slight and of short duration. There was also a transient depression of the phenolsulfonphthalein excretion and urea clearances and a persistent inability of the kidneys to concentrate urine. It is of interest

that on November 27 (twenty weeks following the administration of the drug) the patient returned for a check-up. Although the phenolsulfonphthalein excretion was 80 per cent and the urea clearance 120 per cent of standard, he was unable to concentrate the urine above 1 010. An interesting feature which this patient

Chart 2—Observations in case 2

showed was remarkable prolongation of the PR interval. This has been described in various conditions associated with hypercalcemia. X-ray studies did not show calcification in the urinary tract or soft tissue. There was no osteoporosis. The patient is still in a cast because of delayed healing.

#### COMMENT

In these two cases the administration of repeated large doses of irradiated ergosterol was associated with a prolonged hypercalcemia and persistent impairment of renal function.

Although postmortem examination of rats, rabbits, monkeys and dogs that had been given large amounts of vitamin D have shown renal damage of varying degrees,<sup>5</sup> similar postmortem lesions have been described in observations on only 3 patients, all infants, who had been given comparable doses of the vitamin. The cases have been described in detail by Thatcher,<sup>6</sup> Malmberg<sup>7</sup> and Putscher.<sup>8</sup> But we should not therefore conclude that renal damage is a rare form of ergosterol intoxication. Let us but remember that polyuria and nocturia have been repeatedly mentioned by numerous writers as being manifestations of vitamin D intoxication. Unfortunately, however, none of these clinical investigators have reported studies of renal function.

The question presents itself: Why did these 2 patients develop evidences of renal impairment? What particular circumstances may have led to it? At the very outset we should admit that it is perhaps impossible to give a completely satisfactory answer. But at least we can surmise.

Was it the total quantity of ergosterol which had been given that was responsible? This appears to be unlikely since much larger doses have been given to other patients without any signs of intoxication. Th. Vollmer<sup>9</sup> gave 2,260,000 and 1,260,000 units of

min D<sub>3</sub> respectively to 2 children who were about to die of a tuberculous infection, and nothing attributable to hypervitaminosis was found post mortem. Steck, Deutsch and Reed<sup>10</sup> have shown that 20,000 units per kilogram daily may be given to dogs or to patients for indefinite periods without evidences of intoxication. However, there is no unanimity of opinion on this question. Bauer and Abrams<sup>11</sup> reported that in a series of patients which they studied the administration of more than 200,000 units daily resulted in evidences of intoxication of a more or less severe degree, among them being polyuria, polydipsia and nocturia. There would therefore appear to be factors other than dosage at play.

Bauer<sup>11</sup> and others have called attention to the great individual variation from patient to patient in the dose required to produce intoxication. An amount insignificant to 1 patient may make another acutely ill. A seasonal variation with reactions much more frequent in the summer time is well established.

Diet is also an important factor, since the degree of hypercalcemia produced by irradiated ergosterol is to an important extent conditioned by the amount of calcium ingested<sup>12</sup> and we feel strongly that the renal damage is occasioned solely by the hypercalcemia.

Not the least important point is the manner in which the ergosterol is administered. Lewis<sup>13</sup> has demonstrated that vitamin D or ergosterol given in milk has ten times the potency of that given in oil. And Bauer<sup>11</sup> points out that the lack of toxicity reported by some observers following the administration of large doses of ergosterol may be accounted for on this basis.

We should like to urge strongly that the fact that these 2 young vigorous men were immobilized in casts probably played a major role in facilitating the hypercalcemia, for immobilization alone through atrophy of disuse, as emphasized by Albright,<sup>14</sup> may produce hypercalcemia with resultant renal damage in a young active person. When to the hypercalcemia so produced one adds the hypercalcemic effect of the irradiated ergosterol, an accumulation of factors can result which may prove extremely damaging to the kidneys which have to excrete it.

We had, therefore, several factors at work in these 2 cases which we suggest played a part in producing the clinical picture: large dosage of irradiated ergosterol, a diet of high calcium content, the administration of irradiated ergosterol in milk, the administration of irradiated ergosterol in summer time and finally immobilization in casts. Which of these factors played the most important part in giving rise to the intoxication seems a matter of debate.

Having considered why the intoxication occurred in these cases, one may next ponder over how it occurred.

There are at present two schools of thought concerned with the mechanism of vitamin D or ergosterol intoxication. One holds that all the symptoms of intoxication are due to hypercalcemia with consequent precipitation of calcium salts in the various affected

tissues of the body. The other contends that hypercalcemia is not at all necessary and that injury and necrosis of body tissues can occur in the complete absence of hypercalcemia or of the deposition of calcium salts. Reed<sup>15</sup> has called attention to the fact that hypercalcemia of an extreme degree may occur in the complete absence of any evidence of intoxication. Conversely, he states that he has seen severe intoxication even to the lethal stage in the presence of a perfectly normal serum calcium. Ham,<sup>16</sup> on the other hand, in a series of experiments on rats demonstrated that no degeneration of tissues preceded the precipitation of calcium salts and thought therefore that ergosterol had no specific effect on the tissues but produced damage solely through supersaturation of the blood serum with calcium and consequent salt precipitation. With ample evidence to prove both suppositions, one is free to choose sides.

In these 2 cases we are particularly interested in attempting to picture the nature of the lesions produced in the kidneys, for that is where the damage was done. The most striking functional abnormality which these 2 patients evidenced was a persistent inability to concentrate their urine, and note that this functional impairment persisted in the presence of a normal phenolsulfonphthalein excretion and urea clearance, and in the absence of albuminuria or hematuria. One would therefore expect to find the chief anatomic alterations in the renal tubules.

Is there any evidence to support this supposition? In animal experiments Steck, Deutsch and Reed<sup>10</sup> found that the kidney was the organ which was most vulnerable to ergosterol intoxication. These investigators described renal injury as due to calcium deposition which began in the tubules and thence spread to involve the entire kidney. Chown, Lee, Teal and Currie<sup>17</sup> in experiments on rabbits noted deposition of calcium within and without tubules with consequent obstruction, which finally resulted in atrophy of some nephrons and dilatation of others. They also noted necroses and inflammatory reaction which occurred about the tubular concentrations. Thatcher<sup>6</sup> described the pathologic findings in the kidneys of an 18 month old infant who died following the administration of large amounts of viosterol. These consisted of calcium deposits in the lumens of the collecting tubules with inflammatory reaction about them and fatty degeneration in the cells of the convoluted tubules.

It is our opinion that the primary pathologic agent in these 2 cases was the hypercalcemia which per se damaged the renal tubular epithelium, the only permanent sequelae of this injury being an inability to concentrate urine. In a personal communication Longcope states that he has seen exactly similar sequelae following sulfonamide nephritis,<sup>18</sup> a condition in which there is abundant evidence in both man and animals of extensive tubular involvement.

## SUMMARY

1 Two patients showed evidence of intoxication which followed the administration of massive doses of irradiated ergosterol

2 The circumstances which may have contributed to this intoxication were the amount of drug which was given, the vehicle in which the drug was given, the calcium content of the diet, the factor of immobilization and the season of the year

3 Sudden skeletal immobilization through its effect in producing hypercalcemia in young and vigorous persons undoubtedly played an important part in the intoxication

4 Hypercalcemia alone appears responsible for the renal damage manifested by these patients

5 Because of the type of functional impairment shown by these patients, principal damage is thought to have occurred in the renal tubular epithelium

6 The functional impairment found in certain cases of sulfonamide nephritis is similar

7 Massive doses of irradiated ergosterol, at least under certain circumstances, present potential danger

## THE EFFECT OF PREGNANCY ON THE COURSE OF MYASTHENIA GRAVIS

HENRY R VIETS, M D

ROBERT S SCHWAB, M D

AND

MARY A B BRAZIER, PH D

BOSTON

Pregnancy may and often does cause profound changes in patients with myasthenia gravis. In some instances during part or all of the nine months of childbearing symptoms disappear entirely, more rarely the disease increases in severity in the early months, and in a few instances during this period abortions for therapeutic reasons have been considered justifiable. More rarely remission does not take place during the entire pregnancy.

The subject has received scant attention in the literature, and few instances of pregnancy occurring in patients with myasthenia gravis have been reported. This is partly due to the rarity of the disease. At the Boston Lying-In Hospital only 1 patient with myasthenia gravis was registered in more than 63,268 admissions between 1900 and 1940. Most textbooks on obstetrics, moreover, do not mention the disease.

Myasthenia gravis, or grave muscle weakness, is a disease characterized by an abnormal state of fatigability of particular voluntary muscle groups. The disease was clearly described in the last two decades of the nineteenth century and widely recognized as a clinical entity after 1900. The symptoms commonly observed in the order of their frequency, as pointed out by Viets and Schwab,<sup>1</sup> are ptosis of the eyelids, often with accompanying diplopia, dysphagia, dysarthria and weakness of the muscles of the jaw, general muscular involvement and neck muscle fatigue. The progress of myasthenia gravis is characterized by spontaneous remissions and relapses.

Myasthenia gravis, however, is much more common than was formerly thought. We have notes on 95 patients in the records of the Myasthenia Gravis Clinic at the Massachusetts General Hospital observed since 1935, more than 70 of them have come under direct observation by one of us (H R V) either at the clinic or in private practice. Of this total, we have data on 8 patients who have had one or more pregnancies during the course of their illness, in 2 instances delivery took place while the patient was under our care. It is on this series of cases that we are reporting, first reviewing the previous literature.

### REVIEW OF THE LITERATURE

That pregnancy might affect the disease was suggested by Sinkler<sup>2</sup> as early as 1899, when myasthenia gravis was little known, his patient improved during her sixth pregnancy and had an easy labor, but symptoms developed again a few days after delivery. The disease was of seven years' duration, with three known relapses in its course. Punton<sup>3</sup> in 1899 reported an example of the disease beginning shortly after a prolonged and difficult labor. In 1901, Burr and McCarthy<sup>4</sup> described a patient with severe myasthenia gravis, who at the end of three or four months of her second pregnancy died of respiratory paralysis. The disease had its onset about one and one-half years before death.

In 1902 Goldflam,<sup>5</sup> who wrote one of the earliest descriptions of myasthenia gravis, in 1893,<sup>6</sup> continued his account of 1 of his patients, unmarried when first observed ten years before (5, p 323, case III). She was married in 1897 and, by 1902, at the age of 32, had borne three children. For five years before her marriage the disease had progressed by relapses and remissions. Her first child was born in January 1898, but her exact condition during the pregnancy is not known. Goldflam implies that she was well, for he states that three months after delivery symptoms returned. After a relapse of two months she had a second remission lasting two years. A second pregnancy, coming during this period, terminated normally in May 1900. By implication, again it is presumed that she was well during her second pregnancy, since it is stated that she suffered a relapse a little more than three months after she was delivered, and by August 1900 her condition was considered serious. In her third pregnancy her condition improved immediately. At the end of eight months she gave birth to a premature child who died. Three months later the symptoms of myasthenia gravis returned, although in a milder degree. Goldflam was much impressed by the patient's good health during pregnancy and had a standing pleasantry with his patient: "You should always be pregnant to remain in continuous good health."

The next report came from Kohn,<sup>7</sup> whose patient manifested symptoms of myasthenia shortly after her fourth pregnancy. By the end of the fourth month of

her fifth pregnancy her symptoms were so severe that the pregnancy was interrupted, only to have the patient die seven days later.

A review of the whole subject of paralysis occurring during pregnancy was published by von Hosslin<sup>8</sup> in 1904 and 1905. He concluded that pregnancy, in spite of Goldflam's report, had a strikingly unfavorable effect on patients with myasthenia gravis. Both labor and nursing, moreover, were made more difficult, and during a second pregnancy the disease was more severe than during the first. He advised patients with myasthenia gravis not to become pregnant and thought that abortion was of doubtful therapeutic value. His deductions were soon confirmed by Warrington<sup>9</sup> and particularly by Gemmell<sup>10</sup>. These two authors observed the same patient during different pregnancies. Her illness began during her first pregnancy and her symptoms increased during the entire period. Two years later a second pregnancy occurred, but the condition of the patient in the meantime is not stated. As term approached the patient became exhausted by trivial acts and suffered from severe attacks of dyspnea. As death seemed imminent, Gemmell successfully delivered the child by cesarean section at term. Improvement in the mother's condition was noted immediately. Indemans,<sup>11</sup> about the same time, fearful of his patient's life during her second pregnancy, induced an abortion at the end of twenty weeks. Except for reports by Dupre and Pagniez,<sup>12</sup> indicating that myasthenia gravis may begin during pregnancy, and the observation by Pietro<sup>13</sup> that the disease may begin after pregnancy, the subject remained in this confused state for many years.

It was not until 1915 that another case of myasthenia gravis associated with pregnancy was reported in the literature. In that year Tilney<sup>14</sup> gave the history of a married woman aged 24 whose first symptom occurred about the fourth month of her first pregnancy. Dysphagia, diplopia and general weakness developed. Although she became worse during pregnancy, she was delivered at term after a normal labor of five and one-half hours. A severe attack of respiratory embarrassment occurred two days before delivery and again four days after labor. One month later she suddenly died of respiratory paralysis. At postmortem examination, in addition to a persistent thymus, Tilney demonstrated an adenoma of the anterior lobe of the pituitary. She had shown no symptoms of pituitary deficiency and the relation of the tumor to her disease was unexplained.

In 1916 Fearnside<sup>15</sup> described a patient, aged 20 in 1903, whose symptoms of myasthenia gravis were of two years' duration. Married at the age of 20, her condition at the time was precarious, for she had to remain in bed a week before her marriage on account of weakness in the arms and legs. In 1931, Laurent<sup>16</sup> observed this same patient and reported on the effects

of repeated pregnancies. During the first pregnancy her health was unchanged, although she had had symptoms of myasthenia gravis three years before. During the second pregnancy she had a complete remission for the last three months, only to suffer a relapse in eight days. In each of the five succeeding pregnancies she became worse. Four of them resulted in miscarriage at three, five, five and six months, one was terminated by a therapeutic abortion at six months. As none of the last five pregnancies, however, progressed beyond the sixth month, we do not know whether recovery with complete remission might not have taken place during the last three months, an event which occurred during the second pregnancy. On two occasions the patient recovered rapidly after a miscarriage.

Wolff<sup>17</sup> in 1924 reported another case. Symptoms began three weeks after the first pregnancy and became more severe during the second, until abortion was carried out at the end of the fourth month.

Freiberg<sup>18</sup> in 1931 reported the development of myasthenia gravis during a third pregnancy. Reuter,<sup>19</sup> also in 1931, observed 11 patients with myasthenia gravis, on 1 there are excellent notes regarding the effects of pregnancy. Patient 2, aged 30, had symptoms after a second pregnancy resulting in a miscarriage at three months. In the third pregnancy his patient was much improved and had no symptoms from the third month on. Her weakness recurred after delivery, but when she became pregnant for the fourth time she again showed improvement. The disease returned in a more severe form after delivery and terminated fatally.

Mortara<sup>20</sup> in 1938 described the symptoms of a patient aged 22 whom he observed in two pregnancies. The first, characterized by severe vomiting in the first months, ended at term with normal delivery. In the eighth month however, the patient showed signs of myasthenia gravis, particularly weakness of the neck muscles. For a week after delivery she was better, but in the next three weeks she grew rapidly worse, with dysphagia, dysarthria and ptosis. Forced to give up nursing her baby at the end of ten weeks, she was in a state of relapse for six months, at one time being unable to get out of bed. Somewhat recovered, she again became pregnant, her symptoms increased at the same time and the fetus was taken at the end of two months. In spite of the therapeutic abortion she did not improve for another period of six months, at which time she had a slight remission only to suffer relapse again a month later.

There are a number of other notes in the literature bearing on the problem. Milhorat,<sup>21</sup> for instance, states that 1 of his patients had a remission during pregnancy. After the termination of the pregnancy by abortion the symptoms returned. Silverstein<sup>22</sup> also observed improvement during pregnancy.

Finally Wilson<sup>23</sup> in his textbook on neurology briefly described a patient as follows: "Symptoms lighten to

a surprising degree with the first pregnancy, recurring some months after the puerperium and again remitting with a second, though less well "

Since the use of prostigmine for myasthenia gravis, first advocated by Walker<sup>24</sup> by injection and by Everts<sup>25</sup> by oral administration in 1935, only 1 case in which pregnancy occurred in the course of this disease has been reported, by Tabachnick.<sup>26</sup> His patient had symptoms of myasthenia gravis after her fourth pregnancy. During her fifth pregnancy her symptoms were severe in the first four months, she was given prostigmine with improvement. She did not have a remission during the last five months of pregnancy<sup>27</sup> but required twice as much prostigmine bromide at term as was needed at midterm. The maximum dose was 12 to 14, 15 mg tablets by mouth a day. Delivery, early in 1938, was easy and rapid. In the first four months of the puerperium she improved somewhat but never was able to give up prostigmine entirely. Up to 1941 she progressed, with moderate remissions and relapses, never reducing her intake below 6 to 8 tablets. Her

Chart 1 (case 1)—Relation of subjective symptoms to prostigmine intake during pregnancy in myasthenia gravis covering a period of two years, 1940 and 1941. The subjective symptoms are plotted as a solid line based on the Schwab and Skogland scale of 0 to 4 (A Method of Evaluating the Effect of Treatment in Neuromuscular Disorders, *Journal Lancet* 61: 401-404 [Oct.] 1941) as indicated in the left hand margin. The scale reads 0 = bad, 1 = poor, 2 = fair, 3 = good, 4 = excellent. The prostigmine bromide intake, in milligrams, taken by mouth daily, as indicated in the right hand margin, is recorded in a broken line.

child was in normal health in the fall of 1941, nearly four years after birth

A further case has been observed by Richards<sup>28</sup> in the Department of Medicine, College of Physicians and Surgeons, New York. Symptoms of myasthenia gravis first developed in 1937 when the patient was 25. At first intermittent, the disease became more severe and stationary in 1938. Prostigmine treatment was begun in May 1939. By January 1940 she was much improved and in an almost complete remission. In the spring of 1940 she suffered a relapse. Her pregnancy began in August. In the first three months she was not improved but fairly well maintained on prostigmine. The pregnancy was interrupted by abortion at the patient's request (Presbyterian Hospital, New York) at about three months.

## REPORT OF OUR CASES

CASE 1—*History*—Mrs Evelyn A H, a housewife, of American-Canadian parentage, was first seen in March 1932 at the age of 22. She was born in November 1909, the second of nine children, her parents and all her sisters and brothers were living and well in 1941. Except for childhood diseases, she had never been sick until the onset of her present illness in 1931. Her catamenia became regularly established at the age of 14. For a number of years before her marriage in 1930, at the age of 21, she had worked hard in a mill as well as at home.

*First Pregnancy*—Her first pregnancy resulted in a miscarriage at slightly over six months, in June 1931. The child lived four hours. Four weeks later she returned to work at the mill. Two months after the miscarriage, in August 1931, she had her first symptom of myasthenia gravis—diplopia. This was followed in October and November by dysarthria, dysphagia and nasal regurgitation of liquids. General weakness, difficulty in chewing and pains in the arms, neck and chest were added to the other symptoms. By the time of her first visit to the Massachusetts General Hospital in March 1932 she had lost 20 pounds (9 Kg). She improved only slightly when taking ephedrine sulfate, 24 mg ( $\frac{3}{8}$  grain) by mouth four times a day.

*Second Pregnancy*—While still having symptoms of myasthenia gravis, she again became pregnant in September 1932. During the first month of pregnancy her symptoms were severe, when seen by the neurologic staff, November 17, she was much improved. By the end of the third month a complete remission had occurred and she was doing everything that she had done while in normal health. For the remainder of the pregnancy she felt even stronger than normal and had none of the usual symptoms associated with the pregnant state. She was delivered by cesarean section of a 4½ pound (2,041 Gm) child May 10, 1933. She did not nurse the baby, who after a difficult period on artificial feeding grew rapidly and is now (1941) strong and well.

*Interval History*—The patient was in perfect health until August 1933 but then relapsed into a state of myasthenia gravis (1 e three months after delivery) beginning with the same initial symptom, diplopia, as at the original onset of her disease. In a week her symptoms were as severe as before her second pregnancy in March 1932. Her condition became stationary for nearly three years from 1933 to 1936, apparently aided somewhat in the last two years of this period by the use of <sup>1</sup>1. She was, however, always incapacitated, having her food because of difficulty in mastication, at 8 p m, often so weak that she could not pull the <sup>1</sup>1. During the summer months there was slight improvement. Ephedrine, first taken in March 1932, was repeated after her second pregnancy.

Returning to the Massachusetts General Hospital in April 1936, she was given prostigmine bromide, 15 mg ( $\frac{1}{4}$  grain) by mouth, six times a day, her prostigmine test was scored as 45 out of a possible 72. From then until April 1940, a period of four years, she was seen about once a month at the Myasthenia Gravis Clinic. The steadiness of the course of her disease may be estimated by her intake of prostigmine: her maintenance dose varied in this period from 8 to 13  $\frac{1}{2}$  tablets a day, the average being 9 or 10. Three slight relapses and one equally mild remission occurred, but the course was in general unremitting and at no time was she able to reduce the prostigmine to below 7 tablets a day. Five times she was taken off medicine for purposes of testing, on two occasions she suffered a severe relapse, but on two had better than was expected, the last being when pregnant. Her catamenia was somewhat irregular, sometimes her menses of myasthenia gravis were slightly exaggerated four or five days before a period, only to return to their usual rate when the period began.

In general, her condition was vastly improved in the prostigmine era (1936-1940) when compared with the preprostigmine period (1933-1936). Except for ptosis and some diplopia, under prostigmine treatment she was only slightly handicapped by her disease and was able to carry on her household duties.

**Third Pregnancy**—Her last period occurred April 8, 1940 (chart 1). In May she felt well, taking 12 tablets a day, but in June there was a moderate relapse requiring 17, and later 20 tablets. Her worst time was about the eighth or ninth week of her pregnancy, and from then on she improved rapidly. By the end of the fifth month she was in definite remission and from the sixth to the ninth month in complete remission. Although the remission was somewhat delayed, as compared with the second pregnancy, the completeness was the same, for indeed she had the same feeling of being stronger than normal. She was delivered by cesarean section of a premature, healthy baby (December 31, Boston Lying-In Hospital), weighing 4 pounds 13½ ounces (2,200 Gm). A month later she was taking 2 to 3 tablets of prostigmine a day in a condition of slight relapse. By October 1941 she was back to her maintenance dose of 8 to 10 tablets a day.

**CASE 2—History**—Lillian P. R., married, aged 22, of French-American parentage, entered the Massachusetts General Hospital June 10, 1937. She was born May 10, 1915 and was healthy during childhood. The catamenia began at 13. She was married in 1935 at the age of 20.

**First Pregnancy**—This occurred immediately after marriage and a healthy child was born March 30, 1936 (Milford Hospital). During her pregnancy she was "continually falling" but there were no other signs of weakness until she had diplopia and dysarthria as her first symptoms of myasthenia gravis in March 1937. These symptoms with ptosis, dysphagia, general weakness and difficulty in chewing, were all present on admission. Her prostigmine test on July 20 was 50 out of a possible total of 62. She recovered rapidly when taking 5 15 mg tablets of prostigmine bromide by mouth daily. From June 1937 to April 1938 she was maintained in a satisfactory condition on 4 to 6 tablets of prostigmine bromide a day, but in May 1938 she suffered a slight relapse which was controlled by increasing the prostigmine bromide to 8 tablets daily.

In the fall of 1938 she was able to reduce the amount to 6, but again in December 1938 and January 1939 she required 8 tablets (chart 2).

**Second Pregnancy**—Late in January she was taken off her medicine for a prostigmine test and for motion picture recording. After forty-eight hours without medicine she had only slight weakness, and even the administration of quinine sulfate 0.65 Gm (10 grains) did not produce symptoms. A state of partial remission was therefore recorded. By February 14 she required only 3 tablets to feel completely well. At this time pregnancy was suspected. The diagnosis of pregnancy was confirmed in March, her last period being on February 6. During the first trimester she required 2 to 4 tablets, during the second and third none at all. Full remission thus occurred in the last six months of pregnancy. Normal, but slow, delivery took place October 14 (Milford Hospital).

**Subsequent History**—Diplopia occurred the day after the baby was born and lasted for one month. This was followed by another remission lasting until July 1940, a period of nine months. During this time she had slight general weakness and diplopia during her monthly periods; these symptoms were controlled by a few tablets of prostigmine bromide. By August 1940 she had suffered a severe relapse, requiring 10 tablets daily. She continued to fail in spite of increasing doses of prostigmine bromide, with ephedrine sulfate and potassium gluconate. From December 1940 to February 1941 she was under almost constant observation in the ward of the hospital. Finally she could be maintained only on 15 tablets of prostigmine bromide a day. Death from respiratory paralysis occurred at home March 8, 1941 while the patient was suffering from

a severe bronchitis and septic sore throat. A persistent thymus, with hyperplasia, was demonstrated at autopsy.

**CASE 3**—Mrs. Bertha O., a housewife, of American-Canadian parentage, was first seen in July 1937 at the age of 28.

She was born in July 1909, she had not been ill except for a mild attack of poliomyelitis at the age of 3 years, without residual paralysis. She was married in 1929 and her first, second and third pregnancies, in 1931, 1933 and 1936 respectively, resulted in normal deliveries (Boston City Hospital). In March and June 1936 she had attacks of acute cholecystitis, and in July her gallbladder was removed.

Shortly after the operation, in August or September, the patient had her first symptoms of myasthenia gravis. The initial symptoms were general weakness and extreme fatigability of both the arms and the legs. When the weakness was at its worst the patient could not write, go up or down stairs or get in or out of bed. In June 1937 she had an attack of diplopia lasting two weeks. The prostigmine test was found positive at the Boston City Hospital in July.

Her fourth pregnancy began in April 1937 and delivery took place on Jan. 4, 1938 (Boston City Hospital). Labor lasted sixteen hours, delivery was accomplished without difficulty and the child was normal. Her symptoms of myasthenia

Chart 2 (case 2)—Relation of subjective symptoms to prostigmine intake during pregnancy in myasthenia gravis covering a period of three years, 1938 to the patient's death in 1941. The subjective symptoms are plotted as a solid line based on the Schwab and Skogland scale.

gravis during the period of pregnancy cannot be definitely stated. The patient thinks that she was "worse" and yet some of her symptoms, such as dizziness, scotomas, nocturia, edema and vomiting, were clearly the result of the pregnancy and not due to the myasthenia gravis. General weakness, however, was present and she used a cane to walk. She took 4 or more tablets of prostigmine bromide each day during her pregnancy, although the amount is not exactly known, she may have taken as many as 12. At times there was difficulty in chewing and swallowing, and during the latter part of the pregnancy she could not comb her hair because of weakness of her arm.

There was clearly no remission of the patient's symptoms of myasthenia gravis during pregnancy; there is some evidence, not entirely satisfactory, that she was worse during the last four or five months.

After delivery the patient was somewhat better for three or four months; prostigmine was not required. She did not nurse her child. A relapse occurred in May 1938 and from that date to 1942 the patient has required 6 to 9 tablets of prostigmine bromide a day as a maintenance dose. Except that she is usually worse during her menstrual periods, her course is steady, without remission or relapse.

**CASE 4**—Mrs. Felicine H., a housewife, of Canadian parentage was first seen in June 1939 at the age of 28.

She was born in June 1910, one of eight children, all living and well in 1942. Except for childhood diseases the patient was not sick until the present illness. She was married at

18 and her first, second and third pregnancies were normal. About one and one-half years after the birth of her third child she had her first symptoms of myasthenia gravis, in the summer of 1936. Ptosis and diplopia were soon followed by general weakness and dysphagia. She lost 30 pounds (13.6 Kg).

Her condition was stationary when she began her fourth pregnancy in August 1937. She had an abortion performed in the third month (Worcester) because of her symptoms, which became more severe. While still in the hospital, a prostigmine test was found positive, on 3 or 4 tablets of prostigmine bromide a day she showed immediate improvement.

Since 1937 she has taken 3 to 10 tablets a day as a maintenance dose, on this intake she has remained in fairly good health.

CASE 5—Mrs Anna C., a housewife, of Italian parentage, was first seen in January 1940 at the age of 22.

She was born in September 1917 and had been well, except for childhood diseases, until the present illness. She was married early in 1937, her first pregnancy was normal. Her first symptoms of myasthenia gravis, nasal speech and dysphagia, occurred about six months after her delivery, in the summer of 1938.

In December 1938 her second pregnancy began while she was having fairly severe symptoms. She immediately felt better, even before she was certain of the pregnancy, and she went to work in a shoeshop, in a position she had occupied prior to her marriage. In two or three months all her symptoms were gone and she remained in complete remission for the last two trimesters of pregnancy. Her second pregnancy terminated in August 1939 with normal delivery in four hours.

Symptoms of myasthenia gravis returned five days after delivery. With one mild relapse, the patient has been maintained on 6 to 8 tablets of prostigmine bromide since her pregnancy up to 1942.

CASE 6—Mrs Claire A. D., a shoe factory worker, of French-Canadian parentage, was first seen in May 1932 at the age of 24.

Born in 1908, she was married in 1926 at the age of 18. Three years later her first pregnancy resulted in a miscarriage at five to six months. In 1930 she had her first symptoms of myasthenia gravis—general weakness and a short attack of ptosis and diplopia. Her second pregnancy, in 1931, also resulted in a miscarriage at two months, nothing is known of its effect on her symptoms of myasthenia gravis. From 1933 to 1934 her symptoms were somewhat controlled by ephedrine, but she had difficulty in chewing, as well as diplopia, dysarthria and some general weakness.

Soon after the onset of her third pregnancy, in 1934, she began to feel better, and within a month or two she could run up and down stairs and felt entirely normal. The exact date of the beginning of the remission is not clear, but it came suddenly and was remarkably complete. At the end of six months a therapeutic abortion was performed (Manchester, N. H.), for the patient "feared that the disease might be transmitted to her offspring." Within a few weeks her condition relapsed rapidly to that prior to her pregnancy.

From 1935 to 1939 her condition remained unchanged, somewhat relieved by the taking of ephedrine. In December 1939 she suffered a more severe relapse and returned to the Massachusetts General Hospital after an absence of eight years. From 1940 to 1942, she was fairly well adjusted on 4 to 8 tablets of prostigmine bromide daily.

CASE 7—Mrs Anna L. L., a nurse, of Jewish parentage, was first seen in November 1940 at the age of 32.

There was no relevant history of disease up to the time of her first symptoms of myasthenia gravis in 1937. The disease began with weakness of the jaw and inability to chew. Progression occurred so that her jaw had to be held up with her hand. The neck muscles were soon involved, so that the head fell forward. Subsequently the patient had weakness of the arms. In a few months a remission occurred, lasting for

over a year. A relapse came on in 1939 and in October she had general weakness, diplopia, dysphagia and regurgitation. She lost 17 pounds (7.7 Kg) in about four weeks. The prostigmine test was positive in October 1939 and she responded to prostigmine bromide by mouth in a satisfactory manner, her intake ranging from 8 to 20 tablets, with an average of 10 a day.

Her first pregnancy began in October 1940. Within six weeks she reduced her prostigmine intake from 8 to 3 tablets a day and during the rest of the pregnancy required only 10 in all. Her symptoms of myasthenia gravis entirely disappeared and she felt not only "well" but "better" than her normal state of health. Delivery occurred in July 1941 by low forceps with traction (Massachusetts General Hospital). She nursed her normal child until an abscess of the breast necessitated weaning. Her symptoms of myasthenia gravis returned slightly while she had the abscess and she took 3 to 6 tablets a day. Up to 1942, six months after delivery, she was nearly well, being maintained on 2 to 4 tablets daily.

CASE 8—Mrs Helen D., a housewife, of Irish-American parentage, was first seen in December 1941 at the age of 42.

She was born in September 1899 and had no disease except those of childhood up to the time of her present illness. She was married in May 1925 at the age of 25. Seven children, including twins, were born prior to January 1937. In June 1937 ptosis, her first symptom of myasthenia gravis, developed. Subsequently she showed weakness of her arms and legs, diplopia, dysphagia and dysarthria. She found it difficult to lift her arms and comb her hair. These symptoms were present continuously from about June 1937 to October 1939, a period of more than two years. During this time various treatments, except prostigmine, were tried. These were ineffective, and her condition steadily became worse.

In October 1939 she began her seventh pregnancy and in the fourth month felt better. Shortly her symptoms of myasthenia gravis all disappeared, and during the remainder of the pregnancy she considered herself entirely well. A 6 pound (2,722 Gm) baby was born normally on July 7, 1940 (Winchester Hospital). She contracted whooping cough shortly after the baby was born and finally, by November 1940, her previous symptoms of myasthenia gravis returned. During 1941 her symptoms were severe, treatment with prostigmine bromide was begun after a prostigmine test in December 1941.

#### COMMENT

The course of myasthenia gravis is profoundly affected in most cases by the advent of pregnancy. In patients in whom an even maintenance of symptoms existed for many months before pregnancy on a nearly fixed intake of prostigmine bromide and an equally even course was reestablished after pregnancy, the effect is clearly shown (chart 1). It is well known that progress in myasthenia gravis is by remissions and relapses and that such changes might occur coincidentally with pregnancy must be considered. In view of our experience in the series of 8 cases here reported, however, such a coincidence cannot be held. The prompt change in the symptoms, either a remission or a relapse, occurring in some cases within a few weeks of conception, is also a strong argument against coincidental variations. All our patients have shown some change during pregnancy, most have had remissions even more complete than ever experienced in the natural course of the disease.

Certain features of the effect of pregnancy on the course of myasthenia gravis are worthy of more detailed evaluation. Since prostigmine has so profoundly affected the course of the disease itself, our report must be based largely on experience since 1935. The prostigmine group cannot readily be compared, moreover, with the preprostigmine group.

## REMISSIONS AND RELAPSES

Patients may have both a relapse and a remission in the same pregnancy, the relapse often coming in the first trimester with the remission following. Patient 1 (chart 1) experienced a mild remission during the second month of pregnancy, then suffered a relapse in the third and fourth months. Rapidly in the fifth month a definite remission took place, in the sixth, seventh and eighth months she was better than she had even been at any time during her disease. A slight

TABLE 1—*The Time of Onset and Completeness of Remission in Eight Cases of Myasthenia Gravis During Pregnancy*

| Case | Pregnancy        | Onset                    | Character  |
|------|------------------|--------------------------|--|
| 1    | Second           | Third month              | Complete (above normal)                            |
|      | Third (chart 1)  | Fifth month              | Complete (above normal)                            |
| 2    | Second (chart 2) | Third month              | Complete   |
| 3    | Fourth           | No remission recorded    | relapse in last trimester                          |
| 4    | Fourth           | Abortion in third month, | in relapse   |
| 5    | Second           | Second month             | Complete   |
| 6    | Third            | Second month             | Complete (above normal),<br>abortion at six months |
| 7    | First            | Second month             | Complete (above normal)                            |
| 8    | Seventh          | Fourth month             | Complete (entirely well)                           |

relapse in the ninth month was followed by a good but not complete remission lasting four and one-half months after delivery. A similar course was followed in case 2 (chart 2), mild remission in the second month, a relapse in the third month, complete remission in the fourth to ninth months, with a mild relapse at delivery followed by a remission in the postpartum period lasting five months. The course run by these 2 patients is fairly typical of the group as a whole. There is usually a complete remission of symptoms in the last two trimesters of pregnancy, but the onset may vary in the first trimester or even not occur until the fourth or fifth month (table 1). The onset in 3 cases was in the second month, in 2 in the third month and in the fourth and fifth months in 2 others. In at least 1 case a remission took place before pregnancy was suspected (case 5). Patients long accustomed to taking a maintenance dose of prostigmine bromide by mouth will begin to reduce the daily intake before they realize that a remission is taking place, as in case 1 (chart 1), during the third to fifth months of her pregnancy. The remission may occur abruptly and become complete in about four weeks (case 1). When a remission takes place all symptoms disappear, and many patients report that they feel "better than normal" and "completely well," a condition not attained at any time in the course of their disease except during pregnancy. The remission is like the sense of complete well-being experienced after an injection of prostigmine methylsulfate, as used in the "prostigmine test,"<sup>29</sup> only prolonged over days and months instead of lasting a few minutes.

In 4 of the 8 cases observed no relapses occurred during pregnancy (table 2). One of the 4 patients had an abortion induced at six months, the other 3 went on to delivery at nine months. Patient 1 had a moderate relapse during the third to the fifth month of her third pregnancy and another mild relapse in the ninth month. Patient 2 suffered a moderate relapse in the third month and patient 4 in the first three months, followed by abortion at the end of this period. Patient 3, with the poorest history, did not have a

remission at any time during pregnancy and probably suffered a relapse toward the end of the nine months. She was delivered, however, without the benefits of prostigmine, and her history is not sufficiently accurate to be dependable. In general, the relapses during pregnancy are mild to moderate and usually do not cause undue anxiety when the patient is under complete control with prostigmine. In some cases abortion has been carried out during a period of relapse, a therapeutic measure discussed here.

## ABORTION

In 2 of our cases abortions were induced for therapeutic reasons, 1 in the third month (case 4) and the other after six months (case 6). Neither was directly under our care at the time. Case 4, in which an abortion was induced in the third month because of increased symptoms, illustrates the usual time for pregnancy to be interrupted. Most abortions reported in the literature have been carried out at this time. This therapeutic procedure was seriously considered in case 1 of our series during the eighth and ninth weeks of her pregnancy when her relapse was at its height (chart 1). A week later, however, remission set in rapidly. Under adequate prostigmine therapy it was possible to carry her through her period of relapse, a procedure often not possible before the advent of prostigmine treatment. This was also true in the case reported by Tabachnick,<sup>26</sup> for he carried his patient through to term, under prostigmine, in spite of the fact that no remission occurred. In this respect his report is similar to our case 3.

Before the use of prostigmine, abortion was frequently carried out, usually at the end of the first trimester or in the early part of the second trimester of pregnancy. This is well recognized now as the most dangerous time in the whole nine months. In the case reported by Burr and McCarthy,<sup>4</sup> death occurred in the third or fourth month of the second pregnancy, Kohn's<sup>7</sup> patient had an abortion induced at four months, Indemans'<sup>11</sup> at twenty weeks, Laurent's<sup>16</sup> at six months, and 4 other pregnancies terminated in miscarriage before six months, Wolff's<sup>17</sup> patient had an

TABLE 2—*Relapses in Eight Cases of Myasthenia Gravis During Pregnancy*

| Case | Pregnancy        | Onset and Duration    | Character               |
|------|------------------|-----------------------|-------------------------|
| 1    | Second           | First month only      | Moderate to severe      |
|      | Third (chart 1)  | Third to fifth month  | Moderate                |
|      |                  | Ninth month           | Mild                    |
| 2    | Second (chart 2) | Third month only      | Moderate                |
| 3    | Fourth           | Entire nine months    | Moderate to severe      |
| 4    | Fourth           | First to third months | Abortion in third month |
| 5    | Second           | None                  |                         |
| 6    | Third            | None                  | Abortion at six months  |
| 7    | First            | None                  |                         |
| 8    | Seventh          | None                  |                         |

abortion induced at four months and Mortara's<sup>20</sup> at two months. It seems likely, in view of our more recent experience with patients under prostigmine therapy, that many, if not all, of these abortions would not now be indicated. Abortion, moreover, may not relieve the patient of her symptoms or even prevent a fatal termination from the disease. Kohn's<sup>7</sup> patient died a week after abortion.

At the present time abortion for therapeutic reasons is rarely, if ever, needed, provided adequately controlled prostigmine therapy is instituted. In our series probably neither abortion was justified. There is no reason

<sup>29</sup> Schwab, R. S. and Viets, H. R. The Prostigmine Test in Myasthenia Gravis. Third Report. New England J. Med. 219: 226-228 (Aug. 18) 1938.

to believe that patient 4 could not have been carried through to term. Patient 6 had her abortion induced on the untenable hypothesis that the disease might be transmitted to the child. There is no evidence, either in the literature or in our experience, to lead one to believe that such is ever the case.

#### DELIVERY

In our series of 8 patients, delivery has been supervised in 2 instances. Patient 1 was delivered at the Boston Lying-In Hospital after being under observation for more than five years. A previous pregnancy, her second, was not allowed to go to term, as it was "thought the uterus would fatigue," and the patient was delivered by cesarean section of a  $4\frac{1}{4}$  pound (1,928 Gm) child. Toward the end of her third pregnancy (chart 1) she was in a state of partial remission, taking 45 mg of prostigmine bromide by mouth a day. The patient was delivered by cesarean section, under spinal anesthesia, of a normal child weighting 4 pounds  $13\frac{1}{2}$  ounces (2,197 Gm). The patient exhibited no abnormal symptoms and continued her intake of prostigmine at the same level as before delivery for about four weeks post partum, at which time she had a complete remission lasting a number of months. Because of oligogalactia, the child was given a formula and made a normal gain in weight. At the time of the section the patient was sterilized at her own request. No untoward symptoms at any time disturbed the course of her labor.

Patient 7, who was in complete remission at term, was also delivered without complications. Her labor of eight hours was uneventful, delivery was aided by the use of low forceps and traction. The normal child was nursed for a number of weeks until an abscess of the breast developed. In this instance also myasthenia gravis did not interfere with normal labor and added treatment was not needed. Both patients were closely observed for signs of returning myasthenia and both prostigmine bromide and prostigmine methylsulfate were ready for instant use if needed. There was no indication that either the skeletal muscles or the uterus needed additional support.

In a number of instances, moreover, an accurate history of delivery outside the hospital was obtained. The delivery by cesarean section of the second pregnancy of patient 1 has already been noted. In the second pregnancy of patient 2 normal labor took place at term during a full remission. Patient 3 never had a remission during pregnancy, but in spite of this delivery was accomplished without difficulty, although the labor lasted sixteen hours. In case 5, labor lasted only four hours, delivery was normal at term, the patient being in complete remission. Normal delivery was also reported at term in the seventh pregnancy of patient 8, this patient also being in complete remission. In our series, therefore, labor was normal in each instance and was not affected by the myasthenia gravis even if the patient was not in remission at the time. All patients who were suffering a relapse, however, were under prostigmine control, with the possible exception of patient 3.

Before prostigmine was available, labor was thought to be a serious complication of the disease, and for this reason, at least in part, abortion was frequently carried out. Because of the strain attending labor, von Hosslin<sup>8</sup> advised against pregnancy in patients with myasthenia gravis. Gemmell<sup>10</sup> delivered his patient by cesarean

section rather than have her face labor in her exhausted state. In many instances in the literature, however, labor was normal and without serious effect on the disease, especially if the patient was in a state of remission at term.

In general, either with or without prostigmine, labor itself is not usually affected by the presence of myasthenia gravis. A patient with severe involvement in a state of relapse may have a prolonged and somewhat difficult labor, but this is not the usual experience if the prostigmine intake is well adjusted. The fear of complications during labor should not, in our opinion, justify abortion at an earlier stage of pregnancy.

#### POSTPARTUM PERIOD

Remissions lasting three to five months are the usual course in cases in which there is a remission during pregnancy (charts 1 and 2). The remission in case 1 lasted three months after delivery in both the second and third pregnancy. In case 2 there was a prolonged postpartum remission lasting nine months. Symptoms of myasthenia gravis, however, may return in a few days, as in case 5. In case 7, on the other hand, there were only slight symptoms six months after delivery, but a return in three or four months is about the average, as in case 8. In no case in our series did the myasthenia gravis show itself after delivery in an abrupt or in an alarming manner.

Reuter<sup>19</sup> found his patient's condition worse after delivery and the patient died. One of our patients died (patient 2) but so long after delivery (seventeen months) that the relationship between her pregnancy and her death could not be evaluated.

The evidence for pregnancy making the disease more severe or even being a secondary cause of death is slight. In most instances the disease is not made worse by either pregnancy or labor. Our experience, moreover, does not bear out von Hosslin's statement that nursing has an unfavorable effect on the patient, although most of our patients, for one reason or another, did not nurse their children. In addition, it may be noted, contrary to von Hosslin, that second pregnancies in patients with myasthenia gravis do not result in untoward symptoms or difficult delivery (case 1). Our experience also does not allow us to agree with Novak,<sup>20</sup> who recommends abortion if the disease starts during pregnancy or becomes worse.

#### CONCLUSIONS

The effect of pregnancy on myasthenia gravis is usually favorable. Most patients experience a definite remission in symptoms, relapses, if they occur, are mild. Patients on a maintenance dose of prostigmine before pregnancy may experience a complete remission during the second and third trimesters, and the remission may last three to six months after delivery. Relapses usually occur in the first trimester, when the patient may be at her lowest point. Therapeutic abortion has not been found necessary, nor is it advised, provided the patient can be maintained under prostigmine control. A second pregnancy does not carry more hazard than the first in patients with myasthenia gravis. Pregnancy, labor or nursing does not affect the course of the disease unfavorably under present conditions of treatment.

## OTOSCLEROSIS

RESULTS WITH THE FENESTRATION OPERATION  
AFTER THREE AND ONE-HALF YEARSGEORGE E SHAMBAUGH JR, MD  
CHICAGO

That the hearing may be partially restored, perhaps permanently, in cases of otosclerosis by means of a one stage surgical procedure was first reported by Lempert<sup>1</sup> in 1938 and has since been confirmed by Campbell,<sup>2</sup> by Ersner and Myers<sup>3</sup> and by my own experience.<sup>4</sup> I first used the fenestration operation on July 15, 1938 and have performed it on a total of 117 patients with otosclerosis between that date and Dec 11, 1941. Sufficient time has now elapsed since this new operation was first used to warrant an analysis of the results and an evaluation of its usefulness in impaired hearing due to otosclerosis.

## OTOSCLEROSIS PATHOLOGY, INCIDENCE, DIAGNOSIS

Otosclerosis is a unique disease of bone found only in man and is confined exclusively to the bony capsule surrounding the inner ear. The pathologic lesion of otosclerosis consists of a rather sharply localized focus

Fig 1—Diagram representing the normally functioning ossicular chain transmitting sound vibrations from the drum membrane to the labyrinth.

of vascular, spongy, newly formed bone that appears in the dense, ivory-like labyrinthine capsule. Routine examination of the temporal bones at autopsy reveals an otosclerotic focus in about 1 out of every 20 to 25 adults.<sup>5</sup> This focus occurs most often just anterior to the oval window. As it slowly enlarges it tends to grow across the annular ligament onto the foot plate of the stapes in the oval window, until finally the stapes becomes firmly ankylosed to the margins of the window and the window is virtually obliterated.

The loss of hearing by patients with otosclerosis is due to the stapes ankylosis which prevents air borne sounds from being carried by the drum membrane and ossicular chain to the inner ear. With the oval window obliterated, only sounds loud enough to cause the skull to vibrate can be carried directly through the bone to the inner ear and be heard. Secondary degeneration of the nerve of hearing is a late develop-

ment in cases of otosclerosis and rarely may lead to complete loss of all hearing. In three fourths of the cases in which microscopic otosclerosis was found at autopsy the focus had not yet invaded the oval window and stapes foot plate and the hearing was not impaired.

The diagnosis of otosclerosis with stapes ankylosis is made on the history of the insidious onset of a slowly progressive hearing loss, beginning in early or middle

Fig 2—Diagram showing the ossicular chain fixed by stapes ankylosis as the result of otosclerosis.

adult life without involvement of otitis media, with intact drum membranes and normally patent eustachian tubes and a conduction type of hearing impairment with prolonged hearing by bone conduction and decreased hearing by air conduction. Otosclerosis is one of the most important causes for chronic progressive hearing impairment in early and middle adult life. In a study of the causes of hearing impairment among the members of the Washington, D. C., League for the Hard of Hearing made in 1933,<sup>6</sup> I found that 70 per cent had lost their hearing as a result of stapes ankylosis. Subsequently one of these persons died and microscopic study of the temporal bones confirmed the diagnosis of otosclerosis made in the original survey. The clinical diagnosis of stapes ankylosis due to otosclerosis can be made with accuracy in the majority of cases.

The cause of otosclerosis is not known. There is a strong hereditary tendency, about two thirds of the patients with stapes ankylosis having some relative

Fig 3—Diagram showing the transmission of sound vibrations from the drum membrane to the labyrinth restored by the fenestration operation.

with progressive deafness. Since for every clinical case of stapes ankylosis and loss of hearing there are 3 in which an otosclerotic focus produces no symptoms, it is extremely difficult to determine the exact role of heredity in this disease.

There is no effective medical treatment for otosclerosis, either to arrest or to prevent the progressive

hearing loss or to restore the hearing. The most one can do medically is to make the diagnosis, advise against unnecessary or useless treatment, pay attention to the general health and enjoin the learning of lip reading or the use of an electrical hearing aid.

#### HISTORY OF THE FENESTRATION OPERATION

The surgical treatment of otosclerosis has been a long, slow development beginning more than fifty years ago, soon after the disease was first described, with attempts to loosen or remove the ankylosed stapes. Owing to the difficulty of extracting the ankylosed foot plate and to bony closure of the oval window when it was extracted, these operations were finally abandoned around 1900 in favor of attempts to make a new window into the labyrinth to take the place of the occluded oval window. A considerable hearing improvement was repeatedly observed when such a new window was made, but within a few weeks or months the hearing improvement would be lost, as the window would close by bone regeneration. The problem of making a window that would stay open was pursued, especially by Holmgren in Sweden, who tried many different technics but without success. It was not until 1924 that Sourdille in France, inspired by Holmgren's work, devised a technic with which he obtained a permanently open window with a lasting hearing improvement in some cases. Sourdille's "tympanolabyrinthopexy" was accomplished in three or four stages separated by several months, so that a year or more was required to obtain the hearing improvement. This made the Sourdille operation impractical for the average patient.

Fig 4—Endaural skin incision for the fenestration operation

In 1938 Lempert<sup>1</sup> in this country described a practical one stage operation which produced an end result similar to Sourdille's. The operation consists essentially in exposing the bony labyrinth by partial removal of the mastoid cells, in making a new window into the horizontal semicircular canal with a dental finishing burr and in covering this window with a flap taken

from the skin of the external auditory meatus and continuous with the drum membrane, so that the vibrations of the drum membrane are carried directly to the window and transmitted to the perilymph (figs 1, 2 and 3).

Fig 5—Operating setup used in making the fenestra, showing the binocular dissecting microscope on one side and the dental engine on the other, shielded from the field by sterile sleeves. The glass irrigating container for the saline solution with the tubing for the saline solution and suction may be seen.

In 1940 I introduced the use of constant irrigation to wash away every particle of bone dust while making the window in the bony horizontal semicircular canal, in order to prevent bone dust from falling into the window and leading to the formation of new bone.<sup>7</sup> I also introduced the use of the binocular dissecting microscope to aid in the visualization of the very tiny structures while making the window. Table 2 shows the improved results obtained when these modifications were added to the technic. In 1941 Lempert<sup>8</sup> described a modification of his original technic in which he makes the new window farther forward where the ampulla of the horizontal semicircular canal opens into the vestibule, permitting a larger window to be made closer to the occluded oval window.

#### TECHNIC OF THE FENESTRATION OPERATION

The fenestration technic that I now follow is essentially that described by Lempert,<sup>9</sup> modified by the use of constant irrigation and the microscope while making the window, and is briefly as follows:

Under avertin with amylene hydrate anesthesia the endaural incision is made to expose the cortex of the

9 Lempert (footnotes 1 and 8).

anastoid process (fig 4) Enough of the cortex and mastoid air cells are removed to expose the bony horizontal semicircular canal the incus and the head of the malleus The superior and posterior bony meatal wall is removed, leaving the very thin skin lining the meatus intact with its attachment to the drum membrane. Appropriate incisions through this skin free it in the form of a flap, connected with the drum membrane, with which to cover the new window.

The incus is removed and the head of the malleus is amputated to expose the bulge of the ampulla of the horizontal canal. With the dental finishing burr, working through the microscope and with a film of warm sterile saline solution flowing across the bony horizontal canal (fig 5) the bony covering of the ampulla is slowly removed until only the filmy endosteum remains with pulverized particles of bone adherent to it. With special tiny curved probes and hooks the endosteum is teased away, leaving the perilymph space widely exposed, with the delicate transparent membranous labyrinth floating in it (fig 6). The completed window lies directly above the oval window, separated from it by only the facial nerve in its bony canal and is slightly larger than the oval window. The previously prepared skin flap placed over the new window and held firmly in place with paraffin mesh gauze packs completes the operation.

The hearing which is noticeably improved immediately after the operation, usually declines during the first week and then gradually improves to reach its maximum from two to six months later. Complete healing by epidermization of the operative cavity occurs in from eight to ten weeks in the average case. Tinnitus is frequently but not invariably relieved in the operated ear when the hearing is restored.

#### INDICATIONS

The fenestration operation is indicated in cases of stapes ankylosis with sufficient hearing impairment to constitute a handicap and with an intact nerve of hearing for the conversational frequencies. The bone conduction hearing tests are a reliable measure of the integrity of the nerve of hearing. The patient should be in good health, the drum membrane must be intact and the ear must be free from active or recent inflammation. My oldest patient was 62, my youngest 18. The poorer hearing ear should be selected for operation so that the patient will run no risk of losing what useful hearing he has should the operation be unsuccessful.

#### EVALUATION OF RESULTS

The evaluation of any treatment for the improvement of hearing must be based on audiometrically measured results. Because deafened persons are suggestible, any treatment that stimulates their hope will cause them to pay better attention, and they will seem to hear better. One cannot accept a patient's statement of improvement that is not verified by audiometric tests.<sup>10</sup> To be greater than the normal range of variability a hearing gain must exceed 10 decibels for the conversational tones (512, 1,024, 2,048 vibrations a second).

Not all the published reports of results are sufficiently complete to permit an accurate evaluation. Campbell<sup>11</sup>

in a complete report recorded the hearing gain or loss for the conversational frequencies in 20 consecutive cases in which the operation was performed a year or more before. There was a hearing gain of greater than 10 decibels for these frequencies in 7, a further loss of more than 10 decibels in 6 and no essential change in 7. Frisner and Myers<sup>3</sup> reported 4 good results out of 38 cases in which the operation was done but did not give the decibel gain or loss for conversation in each case. Lempert<sup>12</sup> in 1940, in his most complete report of results, reported a restoration of "practical physiological hearing" in 69, or 58 per cent, of 120 consecutive cases but he does not define clearly what he means by "practical physiological hearing", he does not give the decibel gain in these cases nor does he give the decibel loss in the unsuccessful cases.

One of the principal criticisms of the Lempert fenestration operation when it was first described was that the hearing improvements reported were of too brief duration to be regarded as permanent and that in all

Fig 6—The completed fenestra in the ampulla of the bony horizontal semicircular canal as viewed through the binocular loop with a magnification of 2 diameters. Inset shows the fenestra as it appears through the binocular dissecting microscope with a magnification of 7 diameters. Note the membranous labyrinth running forward and dipping down to expand into the ampulla of the membranous canal which nearly fills the bony ampulla. Immediately below the ampulla may be seen the ankylosed stapes.

probability all or most of the new windows would eventually close.<sup>13</sup> This prediction proved to be partially correct in that many of the early cases originally reported by Lempert as showing a "permanent" hearing improvement<sup>1</sup> subsequently lost their improvement owing to closure of the window.<sup>8</sup> However, some of the early windows have now remained open for periods up to four years,<sup>8</sup> with a maintained hearing improvement, and in these cases it seems likely that the window and the hearing gain will remain indefinitely.

In evaluating the fenestration operation one's first task is to determine the permanency of the hearing improvements obtained. An analysis of results in 128 consecutive ears of 117 patients operated on by me between July 1938 and December 1941 shows that partial or complete closure of the new window with loss of the hearing improvement has thus far occurred in 31. In all these cases repeated audiograms taken

every few weeks permit determination of the date of the beginning drop in hearing indicating closure of the window Table 1 summarizes these data and shows that in the majority of cases (77 per cent) closure

My results with the original Lempert technic are compared in table 2 with my results when constant irrigation and when irrigation and the microscope were added to the original technic With these modifications a probably permanent hearing improvement is obtained in better than 88 per cent of operations

TABLE 1—Time After Operation of Beginning Closure in Thirty-One Ears in Which the Fenestra Closed with Loss of the Hearing Gain

| 1st Month | 2d Month | 3d Month | 4th Month | 5th Month | 6th Month | 7th Month | 8th Month |
|-----------|----------|----------|-----------|-----------|-----------|-----------|-----------|
| 1         | 10       | 7        | 6         | 3         | 2         | 1         | 1         |

Should the new window close partially or completely with loss of the hearing improvement, it may be reopened by a second operation in which the skin covering the bony horizontal canal is elevated, the new

Fig 7 (case 52)—Audiogram of Miss H. F., aged 21, (A) one day before and (B) one year after fenestration. She regained her position as a school teacher after the operation. The solid line in this and the other audiograms indicates the hearing loss in decibels in the operated ear and the dotted line that in the unoperated ear.

Fig 8 (case 53)—Audiogram of Miss H. W., aged 27, (A) two days before and (B) ten months after fenestration. She regained her position as a school teacher after the operation.

began within the first four postoperative months and that after the sixth postoperative month beginning closure as evidenced by a drop in hearing rarely occurred. From these data one may conclude that a hearing gain maintained for more than six months after the fenestration operation is probably permanent.

Fig 9 (case 38)—Audiogram of Mr. F. A., aged 28, (A) one day before and (B) one year after fenestration. He was passed by the Selective Service draft board as having "normal" hearing after the operation.

formed bony lid is removed and the skin flap is replaced. Revision of the original window was carried out on 17 ears, twice on 2 ears. A hearing improvement is now present in 16 of these 17 reoperated ears.

TABLE 2—Comparison of Hearing Results Six Months After Fenestration with Different Techniques

|  | Original Lempert Technique (14 Ears) | Constant Irrigation Added (29 Ears) | Irrigation and Microscope Added (14 Ears) |
|--|--------------------------------------|-------------------------------------|---|
| Hearing improved (more than 10 db gain for speech)     | 4 (28.6%)                            | 22 (75.8%)                          | 30 (100%)                                 |
| Hearing worse (more than 10 db loss for speech)        | 2 (14.3%)                            | 0 (0%)                              | 1 (7.1%)                                  |
| Hearing unchanged (within 10 db of preoperative level) | 8 (57.1%)                            | 7 (24.2%)                           | 13 (92.9%)                                |

Analysis of the present status of the hearing results in the 117 patients with otosclerosis operated on in the three and one-half year period (table 3) shows that 88.9 per cent now have a hearing improvement greater than 10 decibels for the conversational

frequencies 17 per cent have a further loss of more than 10 decibels while in 94 per cent the hearing is essentially unchanged. The average gain in the 889 per cent with a good hearing result is 26.5 decibels for the conversational frequencies. If one analyzes the hearing results in the 73 patients whose hearing has been tested six months or more after operation, an improvement, probably permanent, is found in 64 or 87.7 per cent, a further loss in 2, or 2.7 per cent, and no change in 7, or 9.6 per cent. The average decibel gain in the 65 patients with a probably permanent improvement is 25.7 decibels for conversational tones.

The practical hearing result for the patient after the fenestration operation will vary with the decibel gain for speech and with the amount of the preoperative hearing loss. Many of the patients had used an electrical hearing aid for periods of time up to twenty years before operation. With 2 exceptions all patients who received a lasting hearing improvement state that they

'stone deaf' with a loss of 93 decibels for speech in the operated ear and 85 decibels in the unoperated ear. She gained 28 decibels for speech in the operated ear, bringing it up to a 65 decibel loss. She states that her

Fig. 10 (case 39)—Audiogram of Mr. R. S. aged 26 (4) three days before and (B) ten months after fenestration. He was passed by his Selective Service draft board as having normal hearing after the operation.

now hear better without than they could wearing the aid before the operation and that their present hearing is "natural" and free from the distortion and static of the hearing aid (figs. 11 and 12). One of the 2 exceptions was a patient who before the operation

TABLE 3—Present Status of the Hearing in 117 Consecutive Patients with Otosclerosis Who Have Had 128 Ears Fenestrated with 19 Revisions

|  | Patients      | Percentage |
|--|---------------|------------|
| Hearing improved   | 104           | 88.9       |
| Hearing worse in operated ear  | 2             | 1.7        |
| Hearing unchanged  | 11            | 9.4        |
| Average gain for speech frequencies (512-1704 cps) in the 104 patients with an improvement | 26.5 decibels |            |

had an average loss of 70 decibels for the speech frequencies in the operated ear and a loss of 46 decibels in the unoperated ear. The operated ear gained 20 decibels but is still slightly below the unoperated ear, and the patient still requires a hearing aid. The second exception was a patient who before operation was nearly

Fig. 11 (case 22)—Audiogram of Mr. S. E. D. aged 62 (4) two days before and (B) one year and five months after fenestration. He hears better after fenestration than he did for ten years with a hearing aid.

Fig. 12 (case 48)—Audiogram of Sister H. A. aged 52 (4) seven days before and (B) one year after fenestration. She hears better after fenestration than she did for twenty years with a hearing aid.

hearing now is about equal to but does not surpass her preoperative hearing when she wore her aid. She no longer uses her aid and is still quite hard of hearing though she can now hear loud conversation close at hand whereas previously she could scarcely hear the loudest shout into the ear.

Definite economic rehabilitation has occurred in many of the operated patients. For example, patients 52

(fig 7), 53 (fig 8) and 85 were school teachers who had been forced to give up their profession on account of their hearing impairment. They have all regained their positions and are now teaching school.

When the postoperative hearing level is raised to within 20 decibels of normal for the speech frequencies the patient will have sufficient hearing to be regarded as normal under practically all circumstances. For example, patients 38 (fig 9) and 59 (fig 10) were passed by their Selective Service draft board as having "normal" hearing six months after the fenestration.

When the postoperative hearing level is raised to within 30 decibels of normal the patient will be able to get along without difficulty in the majority of social and economic contacts. Of the 117 patients operated on the hearing loss has been restored to within 20 decibels of normal for the speech frequencies in 11 and to within 30 decibels of normal for speech in 52.

#### COMPLICATIONS

Including the 19 patients who had revisions and the 11 who had both ears operated on, a total of 147 consecutive operations were done on the 117 patients, with no fatalities and no serious complications. Minor complications in this series have consisted of transient facial paralysis in 4 cases beginning seven to ten days after the operation, with complete recovery in each case within one to two weeks, postoperative pulmonary atelectasis in 1 case which cleared promptly on change of position (seating the patient in a chair), hyperventilation with carbon dioxide and forced coughing.

Postoperative sterile labyrinthitis of varying degree is the rule after fenestration and is evidenced by dizziness, nystagmus, ataxia and depression in hearing lasting a few days to a week. In 2 of the 117 cases the hearing depression was permanent, amounting to a further loss of 18 decibels for the speech frequencies in 1 case and 13 decibels in the other. Since in each case the poorer hearing ear had been selected for operation, this further loss was not of serious consequence to the patient's useful hearing. In 2 other patients the dizziness has lasted in a mild form for more than a year, consisting of a sense of unbalance on sudden movements. As a rule the dizziness and ataxia disappear completely within the first three or four weeks after operation.

#### SUMMARY AND CONCLUSIONS

1 The fenestration operation offers the possibility of the partial restoration of impaired hearing, the result of stapes fixation.

2 The problem of the closure of the new window has been largely solved by the technic now being used.

3 The hearing after a successful fenestration operation generally surpasses that secured with a hearing aid (figs 11 and 12).

4 The fenestration operation is not always successful, and the hearing may be made worse in the operated ear. For this reason the poorer hearing ear should always be selected for operation.

5 A hearing improvement maintained for more than six months after fenestration may be regarded as probably permanent.

6 Properly done, the fenestration operation carries little risk to life, health or useful hearing.

7 With proper selection of cases and with the improvements in technic, 88.9 per cent of 117 patients operated on over a three and one-half year period now have a significant hearing improvement.

## DIABETES MELLITUS IN HARLEM HOSPITAL OUTPATIENT DEPARTMENT IN NEW YORK

A COMPARISON OF CERTAIN ETIOLOGIC FACTORS  
IN NEGRO AND WHITE PATIENTS

ALEXANDER ALTSCHUL, MD

Visiting Physician, Harlem Hospital  
AND

ARTHUR NATHAN, MD

Assistant Visiting Physician, Harlem Hospital  
NEW YORK

Diabetes mellitus was formerly considered an uncommon disease in the Negro. This impression, once having been established, is hard to eradicate unless one is confronted with actual cases in a Negro community. The study now being reported certainly negates the idea of the rarity of this disease in the Negro race and probably indicates its prevalence to as great a degree as in the white race.

Harlem Hospital in upper Manhattan of New York City serves a population which is preponderantly Negro, with a fair percentage of Puerto Ricans of Negro extraction. The district extends east of St. Nicholas Avenue from One Hundred and Tenth Street on the south to the Harlem River on the north. It is estimated that there are 425,000 colored people in the five boroughs of New York City. This is 57 per cent of the total city population, 400,000 of whom are Negroes,<sup>1</sup> 200,000 of these in the Harlem district.

The past six years have shown a very definite increase in the number of diabetic patients treated in the outpatient department clinic as judged by the records. While the number of patients in the general medical clinic also has increased, the figures for the diabetic show a larger proportionate rise (table 1). Thus while there was approximately a 20 per cent increase in the new and referred patients in the general medical clinic in five years, the increase in the number of new diabetic patients registered was over two and one-half times the 1936 figure. The same proportion exists in the total number of diabetic patients registered in the clinic.

In 1936 there were approximately 500 diabetic patients who attended the diabetic clinic. By the end of 1939 there were approximately 1,500 diabetic patients on our rolls. The reasons for this increase in registration are not all apparent. One factor, although not the sole one, is the extra money for the special diets added to the allowance given relief "clients." This brings the diabetic to the clinic for special diets and so may account for some of the increase, but we do not see a proportionate increase in the general medical clinic, where special diets also are prescribed. That this increase in diabetes among the Negroes is not merely apparent is better evidenced by the mortality statistics<sup>2</sup> obtained from the Board of Health of New York City for the year 1937 (table 2).

There were more deaths charged to diabetes in 1937 than in any other preceding year. Table 3 shows that the diabetic death rate<sup>3</sup> has been increasing every year with the exception of 1935. In seven years the death rate has increased from 27.2 to 34.5, an increase of 27

From the Metabolic Service of Harlem Hospital. Dr. O. LaRotunda, Medical Director.

2 New York Health Department Vital Statistics, 1937 ed. p. 1.

3 Health of New York City's Millions, 1938 ed. pp. 27-9.

per cent The greatest increase was in Negro females, 76 per cent, while white females increased 26 per cent, white males 23 per cent and Negro males 15 per cent

The diabetic death rate does not reach large proportions until 45 The main reason is the change in the method of classification which lists diabetes as the cause of death even though heart disease or nephritis is involved This adds to the diabetic death rate even though diabetes may be an associated disease rather than the actual cause of death

It is estimated that there are 424 000 colored people in New York City of whom approximately 400,000 are Negro This is 51 per cent of the total population Compared to these figures are those of Leopold in Baltimore for the year 1930 death rate, white 22.02 per hundred thousand (for diabetes) and colored 30.1 per hundred thousand

This study was based on 745 patients who attended the diabetic outpatient clinic with some regularity and for whom the diagnosis of diabetes mellitus was established and confirmed There were 639 Negroes, or 85.75 per cent, and 106 white persons, or 14.25 per cent, and 2 of other races, of the whole clinic group Of females 511, or 87 per cent, were Negroes and 68 or 13 per cent, white Of males 128 or 77 per cent, were Negroes and 38, or 23 per cent white The proportion

TABLE 1—Increase in Number of Patients in Medical Clinic and Diabetic Clinic at the Harlem Hospital Outpatient Department

| Year | Medical Clinic             |              | Diabetic Clinic            |              |
|------|----------------------------|--------------|----------------------------|--------------|
|      | New Patients and Referrals | Total Visits | New Patients and Referrals | Total Visits |
| 1935 | 9 200                      | 46 434       | 130                        | 2 900        |
| 1936 | 9 659                      | 61 014       | 213                        | 3 293        |
| 1937 | 10 340                     | 66 974       | 322                        | 5 327        |
| 1938 | 12 117                     | 84 313       | 187 (?)                    | 6 751        |
| 1939 | 12 043                     | 85 114       | 346                        | 6 876        |

of female Negroes to male Negroes is 4.1, or 80 per cent to 20 per cent Leopold<sup>4</sup> gave the proportion as 3½:1 The proportion of females to males among the white patients in this group was 64 per cent females and 36 per cent males The percentage of female white patients to male white patients in other series is 55.45 (Joslin<sup>5</sup>) and for female diabetic patients he quotes 57.4 per cent in his 15,000 diabetic patients

The distribution of Negroes according to age groups is given in table 4, and of white persons according to age groups in table 5 Thus there appears to be a larger percentage of Negroes in the groups 30-39 and 40-49 than among the white patients The latter have more diabetic patients in the fifth and sixth decades proportionately than the Negroes These figures broken up into sex distribution for each race are given in table 6

The percentage distribution for white males and white females according to age at examination corresponds with minor variations, to the figures given by Joslin<sup>6</sup>

According to our figures there is a greater percentage in the 30-39 and 40-49 groups among the Negro than among the white patients in both males and females As a whole the average female and male Negro diabetic patient is younger than the average white diabetic patient

#### AGE AT ONSET

The onset of diabetes in the Negro occurs at a much earlier age than among white persons In tables 7 and 8, analyzed by five year groups, one sees a definite spurt in the female diabetic patients at the age 35-39, with 15.1 per cent of the total female Negro group,

TABLE 2—Deaths in 1937

| Deaths from all causes in 1937                                |        |  |
|---|--------|--|
| Male  |        | 42 072                                     |
| Female  |        | 35 303                                     |
| White male  |        | 38 792                                     |
| White female  |        | 32 532                                     |
| Negro male  |        | 3 122                                      |
| Negro female  |        | 2 847                                      |
| This gives  |        | 11.0 white males per 1 000 of population   |
|   |        | 9.3 white females per 1 000 of population  |
|   |        | 15.9 Negro males per 1 000 of population   |
|   |        | 13.3 Negro females per 1 000 of population |
| Deaths from diabetes in 1937 2 269 = 2.9% of the total deaths |        |  |
| Of the diabetic deaths there were                             | Number | Rate per 100 000                           |
| White male  | 873    | 23.7                                       |
| White female  | 1 723  | 44.7                                       |
| Negro male  | 23     | 22.9                                       |
| Negro female  | 85     | 57.7                                       |

whereas the female white group is 5.1 per cent The age group 35-44 for the female Negro is 30.2 per cent and for the female white patient 18.7 per cent

The age at onset for white diabetic patients as given by Joslin<sup>5</sup> corresponds to that for white diabetic patients in our group aged 35-44 Thus there is a perceptible tendency for the onset of diabetes to occur at an earlier age group in the Negro than in the white race This is still more apparent when compared to Joslin's figures compiled from a larger white group than our own His tables show a percentage of 30.8 for female white patients aged 35-49, whereas our percentage is 45.9 for female Negroes aged 35-49, 15 per cent more than for the corresponding age groups of white patients

#### HEREDITY

In a race in which not until recently have there been adequate facilities for medical care and the economic level has frequently precluded the services of a phy-

TABLE 3—Diabetic Death Rate per Hundred Thousand by Color and Sex 1931 to 1939

| Year         | All Persons | White |        | Negro |        |
|--------------|-------------|-------|--------|-------|--------|
|              |             | Male  | Female | Male  | Female |
| 1931         | 27.2        | 19.2  | 35.6   | 19.9  | 37.7   |
| 1932         | 29.5        | 20.7  | 37.8   | 21.9  | 46.8   |
| 1933         | 30.1        | 21.2  | 37.5   | 21.4  | 59.4   |
| 1934         | 30.8        | 22.0  | 39.0   | 21.9  | 51     |
| 1935         | 30.2        | 20.4  | 39.4   | 17.7  | 53.5   |
| 1936         | 34.0        | 23.8  | 47.9   | 23.6  | 56.6   |
| 1937         | 31.5        | 23.7  | 44.7   | 22.9  | 57.7   |
| 1938         | 35.4        | 22.9  | 45.0   | 27.4  | 61.4   |
| 1939         | 33.8        |       |        |       |        |
| Total deaths | 2 935       | 970   | 1 965  | 29    | 117    |

sician until the very end, one cannot expect too much accuracy as to knowledge of cause of death of relatives Despite this we were able to obtain a positive history of diabetes in some other member of a family in 14.7 per cent of our female Negro patients The figures are given in table 9 The statistics as compiled from Joslin's clinic<sup>6</sup> show an incidence of diabetes in the

<sup>4</sup> Leopold E. J. Ann Int Med 5:285 (Sept.) 1931

<sup>5</sup> Joslin E. P. Treatment of Diabetes Mellitus ed. 6 Philadelphia 1937

<sup>6</sup> Joslin E. P. Treatment of Diabetes Mellitus table 10

families of his patients as 24.5 per cent. We believe that this incidence of heredity will rise as time goes on because of more accurate information and knowledge regarding the cause of death among relatives of Negroes. The figures for female Negro heredity and family history and for white heredity and family history are almost

TABLE 4—*Distribution of Negroes According to Age Groups*

| Age   | No. of Cases | Per Cent |
|-------|--------------|----------|
| 10-19 | 5            | 0.8      |
| 20-29 | 11           | 1.7      |
| 30-39 | 65           | 10.2     |
| 40-49 | 172          | 26.9     |
| 50-59 | 217          | 33.9     |
| 60-69 | 156          | 21.3     |
| 70-79 | 33           | 5.2      |
| Total | 639          |          |

alike, 14.7 per cent for Negro family history and 15.3 per cent for white family diabetes history.

The male Negro positive family history is 10.8 per cent, whereas for white men in a much smaller group it is 26.3 per cent. The positive family history in Negroes both male and female is 13.8 per cent and in white patients male and female combined it is 19.6 per cent.

These figures for hereditary and familial incidence of diabetes mellitus in the Negro race are sufficiently prominent to place heredity as an etiologic factor in diabetes mellitus in the Negro race.

#### OBESITY

Table 10 gives the weights for the four groups of diabetic patients at the time of admission to the clinic. For most of the patients it was difficult to obtain maximum weights and weights at onset, and for that reason an attempt to tabulate this information was abandoned.

Many factors are at work influencing the weights of the Negro population in this community. Dietary habits have been influenced by migration from the South to the North, and again a long period of economic depression certainly has been responsible for alterations in type and quantity of the food ingested. This probably accounts for the larger number of underweight female Negroes than underweight female white patients. The

are for overweight females 67.4, males 62.7, normal females 13.6, males 17.0, underweight females 10.0, males 19.4. Our female group, both white and Negro, is somewhat comparable to Joslin's group, 61 per cent in our group to an average of 67 per cent in his group.

#### SEVERITY OF DIABETES (INSULIN)

The diets prescribed vary between carbohydrate 100, protein 70, fat 70 and carbohydrate 200, protein 70, fat 70. The average diet is carbohydrate 135, protein 70, fat 70. The insulin requirements are given in table 11.

A comparison of both white and Negro female diabetic patients shows approximately the same proportion, about 25 per cent, carried without insulin in the two groups. The Negroes have more in the mild and moderate groups than do the white patients, and less in the severe groups. While the figures are not preponderantly conclusive, the Negroes seem to have a larger percentage in the mild groups than do the white patients.

#### DURATION OF DIABETES

Of female Negroes there were 520 with diabetes of one to thirty years' duration, the average being five and one-tenth years.

TABLE 6—*Sex Distribution According to Race*

| Age   | Negroes      |          |              |          | White Patients |          |              |          |
|-------|--------------|----------|--------------|----------|----------------|----------|--------------|----------|
|       | Female       |          | Male         |          | Female         |          | Male         |          |
|       | No. of Cases | Per Cent | No. of Cases | Per Cent | No. of Cases   | Per Cent | No. of Cases | Per Cent |
| 10-19 | 3            | 0.6      | 2            | 1.6      |                |          | 2            | 0.3      |
| 20-29 | 8            | 1.6      | 3            | 2.3      | 1              | 1.5      | 3            | 7.9      |
| 30-39 | 55           | 10.8     | 10           | 7.8      | 2              | 2.9      | 4            | 10.5     |
| 40-49 | 129          | 25.2     | 43           | 33.6     | 12             | 17.6     | 7            | 18.4     |
| 50-59 | 181          | 35.4     | 56           | 28.1     | 29             | 42.6     | 9            | 22.7     |
| 60-69 | 109          | 21.3     | 27           | 21.1     | 20             | 29.4     | 11           | 28.9     |
| 70+   | 26           | 5.1      | 7            | 5.3      | 4              | 5.9      | 2            | 5.1      |

Of female white patients there were 68 with diabetes of one to eighteen years' duration, the average being five and seven-tenths years.

Of male Negroes there were 68 with diabetes of one to twenty years' duration, the average being four and five-tenths years.

Of male white patients there were 39 with diabetes of one to twenty-eight years' duration, the average being seven and seven-tenths years.

The female white and Negro patients average about the same duration of diabetes. The male white average duration is seven and seven-tenths years, a much longer duration for white males than for Negro males.

#### COMMENT

In a disease like diabetes it is difficult to step in and draw sharp conclusions from a group of 639 patients compared to a much smaller white group, 106. However, the group is large enough and the patients are sufficiently cooperative to enable us to draw certain conclusions.

The apparent increase of diabetic registration in the clinic during 1935-1939 leads to the conclusion that diabetes mellitus in the Negro is on the increase. This is more real than apparent is evidenced by the increase in diabetic deaths throughout the city during a similar five year period. The increase in fatal diabetic deaths reached 76 per cent in 1937.

TABLE 5—*Distribution of White Patients According to Age Groups*

| Age   | No. of Cases | Per Cent |
|-------|--------------|----------|
| 10-19 | 2            | 1.9      |
| 20-29 | 4            | 3.8      |
| 30-39 | 6            | 5.7      |
| 40-49 | 19           | 17.9     |
| 50-59 | 38           | 35.8     |
| 60-69 | 31           | 29.2     |
| 70-79 | 6            | 5.7      |
| Total | 106          |          |

overweight group, strikingly enough, is the same in white and Negro females, 61.8 per cent to 61.4 per cent respectively. Also noteworthy is the greater proportion of overweight female Negroes to male Negroes, 61.4 per cent to 46.1 per cent.

Undoubtedly other endocrine deficiencies are present in the female. The Negro males show a 15 per cent higher incidence of obesity than white males, 46.1 per cent to 31.6 per cent. The percentages given by Joslin<sup>5</sup>

The sex distribution in the Negro is preponderantly female, 41 Leopold<sup>4</sup> found the proportion to be  $3\frac{1}{2}$  females to 1 male. The proportion of female white patients to male white patients in our series was approximately 2:1. Joslin<sup>5</sup> as previously reported, had 57.4 per cent females.

Another factor in which the Negro diabetic patient varies from the white diabetic patient is the age at examination. There seems to be a higher percentage of Negroes in the third and fourth decades than of white patients, 37.1 per cent of all Negro diabetic patients are in age group 30-49, whereas 23.6 per cent of the white patients are in this group. Joslin's figures for white patients and our figures for the same groups are approximately the same.

As in other degenerative diseases the onset of diabetes mellitus in the Negro comes at a much earlier age than it does in white patients. Boyce<sup>6</sup> in a recent article on gastric carcinoma, says "As a matter of interest it might be mentioned that 25 of 38 patients (with gastric carcinoma) under 40 years of age were Negroes" and substantiates Garther's statement that

this disease develops at an earlier age in the Negro than in the white subject. Although gastric carcinoma and diabetes mellitus are not related conditions, the comment on the origin in the Negro at an earlier age group is of interest.

Our statistics warrant a similar comment: diabetes mellitus begins in a much earlier age group in the Negro than it does in the white race: 30.2 per cent of Negroes from 35 to 44 years of age and 18.7 per cent of white patients in our series, compared to Joslin's 30.8 per cent of white patients from 35 to 49 years and our series of 45.9 per cent of Negro females from 35 to 49 years.

As previously stated the statistics on heredity and familial incidence must be considered as incomplete and as underestimating the true incidence. It is difficult to obtain an accurate family history in many cases both Negro and white considering the economic and social level of the clinic patients. Despite this the percentage of familial incidence is almost the same in our female Negroes as in our female white patients. Yet we know that in larger clinics of white patients where the source

of patients is of a higher economic and social level the hereditary factor is higher than our figures for female white patients indicate, viz. 14.7 of Negro family history and 15.3 per cent of female white family history.

Joslin<sup>5</sup> reports a 24.5 per cent incidence of diabetes in families of diabetic patients.

TABLE 8—Age at Onset, According to Joslin<sup>5</sup>

| Age      | Males  |          | Females |          |
|----------|--------|----------|---------|----------|
|          | Number | Per Cent | Number  | Per Cent |
| All ages | 314    |          | 3023    |          |
| Under 5  | 67     | 2.1      | 51      | 1.6      |
| 5-9      | 90     | 2.9      | 91      | 2.8      |
| 10-14    | 118    | 3.8      | 112     | 3.5      |
| 15-19    | 102    | 3.2      | 80      | 2.6      |
| 20-24    | 17     | 4.0      | 77      | 2.4      |
| 25-29    | 164    | 5.2      | 153     | 4.2      |
| 30-34    | 200    | 6.6      | 142     | 4.4      |
| 35-39    | 251    | 8.1      | 219     | 6.8      |
| 40-44    | 72     | 10       | 314     | 9.7      |
| 45-49    | 397    | 12.7     | 46      | 1.4      |
| 50-54    | 415    | 14.7     | 507     | 15.7     |
| 55-59    | 36     | 10.7     | 439     | 13.6     |
| 60-64    | 271    | 8.7      | 299     | 9.2      |
| 65-69    | 118    | 3.8      | 187     | 5.8      |
| 70-74    | 68     | 2.2      | 69      | 2.1      |
| 75-79    | 27     | 0.9      | 33      | 1.0      |

We are satisfied that heredity is a factor in the Negro as it is in the white race and that as time goes on the percentage in Negroes will rise as the result of more disseminated knowledge of deaths among the relatives.

The female Negro is no exception to the fact that obesity is common among the diabetic. In fact, the percentage for the two groups is almost the same, 61.4 for Negro females and 61.8 for white females. Male Negroes show 46.1 per cent overweight and male white patients 31.6 per cent. Joslin's figures give a slightly higher incidence for female white patients, 67.4 per cent, and 62.7 per cent for male white patients. Both white and Negro males show a high percentage who are underweight: 36.8 to 35.2. Undoubtedly economic factors explain the higher rate of malnutrition in our male clinic patients than in Joslin's group.

Judging by insulin requirements of our clinic patients, there appear to be more female diabetic patients in the mildly affected group of 1-20 units of insulin than white females: 34.4 to 23 per cent respectively. This makes the percentage of no insulin and insulin under 20 units in Negro women 59 and in white women 48.5 per cent. The percentage is much less for severely affected female

TABLE 9—Diabetes in Some Other Member of the Family

| Sex    | Race  | Number of Patients | No. Family History | Family History |         | Positive per Cent |
|--------|-------|--------------------|--------------------|----------------|---------|-------------------|
|        |       |                    |                    | Positive       | Unknown |                   |
| Female | Negro | 301                | 34                 | 73             | 64      | 14.7              |
|        | White | 59                 | 59                 | 9              | 0       | 15.3              |

|        | White | 33                 | 33                 | 10             | 0       | 26.3              |
| Total  | Negro | 61                 | 40                 | 87             | 64      | 13.8              |
|        | White | 97                 | 97                 | 19             | 0       | 19.6              |

Negro diabetic patients than it is for the white: 17 to 29. This seems to confirm the general impression that diabetes is milder in the Negro than it is in the white race. One should not get a false sense of security from these figures for diabetes mellitus certainly plays havoc with the Negro as judged by our hospital experience and by rising mortality statistics.

<sup>6</sup> Boyce, F. F. Carcinoma of the Stomach in a Large General Hospital. *J. A. M. A.* 117: 1670 (Nov. 15) 1941.

In our study of the duration of diabetes in the four groups, only the male white patient shows an average duration decidedly longer than the male Negro or female groups, seven and seven-tenths years for male white patients, about five years for females of both races and four and five-tenths years for male Negroes

SUMMARY AND CONCLUSIONS

- 1 The number of new and referred diabetic patients at the Harlem Hospital outpatient department increased two and one-half fold in the 1935-1939 period The total number of registered diabetic patients has tripled in the same period
- 2 The mortality for female Negro diabetic patients has increased 76 per cent in seven years, while for female white diabetic patients it has increased 26 per cent in the same period
- 3 Female Negro diabetic patients predominate 4 females to 1 male
- 4 The average female and male Negro is younger than the average white diabetic patient

TABLE 10—Weights of Diabetic Patients

| Sex                   | Number of Patients | Normal 5% | Underweight | Overweight |
|-----------------------|--------------------|-----------|-------------|------------|
| Female Negroes        | 511                | 20.2      | 18.4        | 61.4       |
| Female white patients | 68                 | 26.5      | 11.8        | 61.8       |

| Total         | 497           |          | 59                    |          |

- 5 The onset of diabetes is much earlier in the female Negro than in the female white patient
- 6 Heredity and familial incidence are factors in the Negro diabetic etiology
- 7 Obesity predominates and is just as common in the female Negro as it is in the female white diabetic patient Undernutrition is slightly higher in both male and female Negro diabetic patients than in white groups
- 8 The Negroes appear to have higher percentages in the noninsulin and mild diabetic groups than do corresponding groups of white patients
- 9 The duration of diabetes in the clinic patient is the same for Negro and white female diabetic patients, only the white male has had diabetes a longer time

350 Central Park West—811 Walton Avenue

Social Evolution—History shows, however, three prominent directions in which man's social evolution is proceeding (1) the invention and development of new techniques for supplying our wants, (2) the understanding of nature and apparently (3) the consideration of the rights of others There is no reason to suppose that a modern child brought up in a primitive community would differ in any of these regards from his primitive associates That is, the differences are not individual changes but social changes, occurring through the continued interaction of people on each other—Compton, Arthur H Science, Religion and a Stable Society, *Assn Am Coll Bull* 26 206 (May) 1940

DIGITALIS IN ARTERIOSCLEROTIC (CORONARY) HEART FAILURE

WITH NORMAL RHYTHM

NATHAN FLAXMAN, MD

Clinical Associate in Medicine Loyola University School of Medicine,  
Associate Attending Physician, Cook County Hospital  
(service of Dr Harry J Isaacs)  
CHICAGO

During the past twenty years, since the work of Janeway<sup>1</sup> and Christian<sup>2</sup> on the use of digitalis in heart failure with normal rhythm, the attitude toward the prognosis and treatment of myocardial insufficiency has been altered considerably Not so very long ago Parkinson and Clark-Kennedy<sup>3</sup> reported 100 unselected cases of severe congestive failure with normal rhythm and stated "This series has only been obtained by searching several large hospitals over a period of two years" They implied that the arrhythmias, especially auricular fibrillation with severe failure, were far more common Luten<sup>4</sup> and Marvin<sup>5</sup> administered digitalis in suitable large doses under properly controlled conditions to patients with advanced congestive heart failure, regular rhythm and considerable edema and noted improvement mainly in one group, that designated as "arteriosclerotic heart disease" Clinical improvement was noted also as the result of the use of digitalis in certain cases of heart failure with normal rhythm but without edema<sup>6</sup> The drug was considered of great benefit for patients with paroxysmal dyspnea and of some value for many patients with dyspnea brought on by exertion, both groups having a normal rhythm<sup>7</sup>

Stewart and his co-workers<sup>8</sup> delved further into the matter and concluded that digitalis decreases the cardiac size, which was interpreted as an effect on tone Gavey and Parkinson<sup>9</sup> generalized that digitalis is always indicated in congestive heart failure irrespective of the rhythm, but it is often inefficient, as it fails completely in about a third of the cases Harrison<sup>10</sup> considered the essential action of digitalis as consisting of an increase in the efficiency of the heart by diminishing dilatation, but Gold and Cattell<sup>11</sup> stated that the heart muscle is not overdistended in clinical heart failure Apart from the action of digitalis on the heart size during decompensation, there is also the question of the effect of the drug on the heart rate during congestive failure The consensus today seems to be that the drug is effective in heart failure with normal rhythm

The digitalis preparation used in this study was supplied by Faltz Davis & Co

irrespective of the rate.<sup>12</sup> Wood<sup>13</sup> however stated that, while it is generally accepted that digitalis may be of benefit in cases of congestive heart failure with normal rhythm, there is disagreement as to the frequency of such benefit, as to whether the etiologic type of heart disease influences the response and as to the mechanism whereby the improvement is brought about.

In an effort to determine some of the problems involved a study was made of the use of digitalis in heart failure with normal rhythm in which the underlying heart disease was due to one of the four important etiologic factors (hypertension, rheumatic fever, syphilis or coronary arteriosclerosis). The etiologic groups were considered separately as it is my opinion that the factor underlying the heart disease does influence the response.<sup>14</sup> Therefore, in this study the effect of digitalis was investigated in an older group of patients with uncomplicated arteriosclerotic (coronary) heart failure and normal rhythm. A group of 51 unselected patients whose congestive heart failure was on this basis were treated and the responses analyzed. As far as I could myself determine, all were decompensated for the first time, and none had any disturbance of rhythm or conduction.

There were 43 men (84 per cent) and 8 women (16 per cent), whose ages ranged from 53 to 88, with an average age of 69.4 years. Those with a normal

TABLE 1—Percentage of the Age Groups at the Onset

| Ages   | Male | Female | Total | Per Cent |
|--------|------|--------|-------|----------|
| 53-60  | 0    | 1      | 1     | 1.9      |
| 61-70  | 26   | 6      | 32    | 62.9     |
| 71-80  | 15   | 1      | 16    | 31.3     |
| 81-88  | 2    | 0      | 2     | 3.9      |
| Totals | 43   | 8      | 51    | 100.0    |

rate had an average age of 69, while the ones with sinus tachycardia had an average age of 69.9 years (table 1). These cases with normal rhythm represent 32 per cent of all patients with arteriosclerotic heart failure, ranking second in importance to auricular fibrillation, which occurs in 44 per cent of heart disease due to this condition. There was no history of hypertension or any of its sequelae in any of the 51 patients. The systolic blood pressure varied from 100 to 140 in 79 per cent, was between 140 and 150 in 13 per cent, and was below 100 in 8 per cent. Ninety-eight per cent of the patients had a diastolic blood pressure below 90 mm of mercury, while in the other 2 per cent it was between 90 and 100 mm.

As to the size of the heart during congestive failure, in 91 per cent of the patients the left heart border was percussed 9 to 12 cm from the midsternal line in the fifth intercostal space. Allowing for a known personal error of approximately 1 cm on cardiac percussion, these hearts were considered to be only slightly to moderately enlarged. When compared with the average heart size when the underlying cause of the heart disease was hypertension, rheumatic fever or syphilis these hearts were much less enlarged. Enlargement of the right heart border beyond the right parasternal line in the fourth intercostal space was not noted by percussion in 93 per cent.

These patients were divided into two groups, those with a normal rate (61 to 99) and those with sinus tachycardia (100 to 150). If the effect of digitalis was mainly on the rate, then it was thought that the results should be somewhat similar in the two groups. Further, if it was the reduction in rate that brings about improve-

ment and restores compensation, the results should be better in those with a sinus tachycardia. For purposes of analysis, the two groups were considered from various points of view.

## DURATION OF SYMPTOMS

A striking difference in the mortality of the two groups was noted even before the use of digitalis was considered. Those with a normal rate had a mortality of 6.4 per cent, and in those with sinus tachycardia it was 60.0 per cent (table 2). Regardless of whether the symptoms were of one month or of one to two years in duration before treatment with digitalis was started, this difference in mortality was apparent section by section.

## TYPE OF HEART FAILURE

The combined type of right and left sided failure, denoted by both the symptoms and the signs of systemic congestion, was present in 25 (49.1 per cent), while isolated failure of the left ventricle, denoted by symptoms and no signs of systemic congestion, was found in 26 (50.9 per cent) of the patients. Not only was there a decided difference in the mortality of these two groups (table 3) but there was an even greater difference between those with a normal rate and those with a tachycardia. Moreover among the patients with the combined type of failure, which has a less favorable

TABLE 3—Type of Heart Failure in Relation to the Mortality

| Type                         | Normal Rate |              | Sinus Tachycardia |              | Totals |              |
|------------------------------|-------------|--------------|-------------------|--------------|--------|--------------|
|                              | Cases       | Mortal-ity % | Cases             | Mortal-ity % | Cases  | Mortal-ity % |
| Combined ventricular failure | 12          | 8.3          | 13                | 76.0         | 25     | 44.0         |
| Left ventricular failure     | 19          | 5.2          | 7                 | 28.0         | 26     | 11.0         |

prognosis than isolated failure of the left ventricle, the mortality was eight and five-tenths times greater in the 13 with a tachycardia as compared with the 12 who had a normal rate.

## PERIOD OF USE OF DIGITALIS

The length of time required to restore compensation by treatment with digitalis offers prognostic significance, for the longer it takes to restore a patient the less favor-

14. Flaxman Nathan. Unpublished data.

able the outlook Here again there was a distinct difference in the mortality of the two groups (table 4) Except for the two deaths among those with a normal rate, only 1 of the remaining 29 patients required more than a month to restore compensation, and 19 (65 per cent) of the 29 were fully compensated within two weeks after treatment with digitalis was started

CAUSES OF DEATH

Congestive heart failure was the most common cause of death (table 5) However, only one death in those with a normal rate was due to this cause This

TABLE 4—Period of Use of Digitalis to Restore Compensation

| Period          | Normal Rate |              | Sinus Tachycardia |              | Totals |              |

occurred in a 67 year old woman with a history of six months' duration who had a combined ventricular failure when first seen and who failed to respond to adequate doses of digitalis within a period of three weeks when death occurred due to congestive heart failure Of the nine deaths due to this cause among those with a sinus tachycardia, all had combined failure at the time treatment was instituted There was one sudden death of a patient with sinus tachycardia, a man aged 60 who gave a history of dyspnea, cough and edema of three weeks' duration, with all the signs of systemic congestion On the eleventh day of treatment, when he appeared to be making a good recovery, sudden death occurred unexpectedly An autopsy revealed severe coronary sclerosis with a partial occlusion of the left coronary artery and myomalacia of the anterior wall of the left ventricle Without an autopsy this sudden death would have been considered due to overdigitalization, even though there were no clinical signs of such intoxication

COMMENT

As stated previously, our outlook has been altered considerably because we are seeing decompensated patients much earlier than in former years The time may come, although it is only fifteen years since there was such difficulty in finding cases of normal rhythm when the majority of decompensated patients will be seen early enough to institute treatment with digitalis while isolated failure of the left ventricle and normal rhythm are present Such cases respond well to digitalis and have the best prognosis, even though the underlying cause of the heart disease is on an arteriosclerotic (coronary) basis and the patient is advanced in years Digitalis exercises an action on the ventricular muscle which is beneficial independently of any particular cardiac mechanism and altogether aside from any effect on rate<sup>15</sup> This study on coronary heart failure substantiates the view If the effect were primarily on the rate, the results among those with tachycardia would have been better than among those with a normal rate Since the primary action of the drug is on the heart muscle, this secondarily may bring about a reduction in rate Moreover, there was little or no change in the

heart size among these patients, so that such a characteristic could not be attributed to digitalis

The increase in the size of the heart which occurs in congestive failure is a compensatory mechanism, but an adequate supply of oxygen is essential for hypertrophic changes to occur either in compensated or in uncompensated hearts Anoxemia of the muscle is brought about by one of two changes, which, however, may occur concurrently (1) alterations in the coronary arteries and (2) a great increase in muscle mass (hypertrophy) with a subsequent demand for a greater capillary blood supply, which in turn is usually compensated by enlargement of the heart In coronary heart disease the alterations in the arteries already exist which lead to anoxia of the muscle so that hypertrophy does not occur Besides, dilatation of the heart is not usually an unfavorable phenomenon but an adaptive mechanism by which the failing heart maintains its optimal capacity for work<sup>11</sup> Therefore, when the demands made on the heart both by the patient and by the anoxia of coronary atherosclerosis are too great, it dilates in order to work harder to bring more blood, and with it more oxygen to an already handicapped myocardium Finally the only compensatory mechanism that remains is an increase in rate In turn the tachycardia not only goads the weak muscle to more frequent contractions but deprives the already embarrassed myocardium of adequate nourishment

It has been suggested that under such conditions the slight to moderate increase in the cardiac size is not a compensatory mechanism but is due to an increase in the water content of the myocardium<sup>16</sup> Also, as stated by Boyer and Poindexter<sup>17</sup> the beneficial effect of digitalis in cardiac failure may be brought about in part by a cation-like action on the myocardium whereby potassium is maintained within the cell and cell hydration is improved This may account for the marked difference in the mortality of the two groups with normal rhythm In those with a normal rate the permeability of the muscle cell to vital electrolytes is altered but reversibility is still possible, while in those with a tachycardia which in itself has exhausted the heart muscle the cell permeability is so completely affected that there is much less chance of repair

Some explanation is necessary as to the strength of digitalis used in this study because of a warning recently issued<sup>18</sup> There is no question that the official U S P XI powdered digitalis has a potency considerably greater than the U S P X digitalis employed prior to 1936 Difficulty has arisen not only because of the acceptance of the U S P XI unit by some but not by all of the nationally known pharmaceutical firms but because of

16 Gross H Water Content of the Myocardium in Hypertrophy and Chronic Congestive Failure J Lab & Clin Med 27: 899 1940  
17 Boyer P K and Poindexter C A The Influence of Digitalis on the Electrolyte and Water Balance of Heart Muscle Am Heart J 20: 586 1940  
18 Bland E T and White P D The Strength of Digitalis Clinical Use A Warning J A M A 117: 1243 (Oct 11) 1941

15 Luten Drew The Clinical Use of Digitalis Springfield, Ill., Charles C Thomas, 1936

the failure of those who have accepted the U S P XI unit to offer a suitable explanation of the change. The original container of the digitalis preparation used in this study was labeled on the front, as follows: "Each capsule represents 1 U S P Digitalis unit, 1 International Unit, 1 cc (15 minims) Tr Digitalis U S P XI." On the side of the container was this statement: "0.1 Gm (1½ grains) digitalis fat-free per capsule—approximately one cat unit per capsule." However, in the pamphlet that came with the container there was this statement: "The activity is determined physiologically by the method official in the U S P XI, and known as the Minimum Systolic Dose (M S D) Frog Heart Method or more commonly called the 'One hour frog heart method'."

Such labeling may be necessary to meet the requirements of the new food and drug laws, but to those of us in practice who actually use the contents of such containers it is very confusing. No 2 patients require the same amount of digitalis for either digitalization or maintenance and the dose for each is best considered in grains or in minims, regardless of the method used for standardization.

Bland and White<sup>18</sup> consider U S P XI powdered digitalis 33 to 50 per cent stronger clinically than that previously employed. In the treatment of congestive heart failure with normal rhythm on a coronary basis it should be considered at least 50 per cent stronger than the older digitalis. Previous to 1936 an elderly decompensated patient could readily be given from 4½ to 9 grains (0.3 to 0.6 Gm) of digitalis a day for the first three days with comparative safety, and after that the dose could be gradually reduced until compensation was reestablished. With the new digitalis it is no longer safe to give more than 3 to 4½ grains (0.2 to 0.3 Gm) for the first two days, and it is wise to have the medication omitted one day a week. In the elderly patient with coronary heart failure and a normal rhythm it may be homicidal to "push" digitalis for a rapid effect or in large doses. Toxic manifestations are common even in doses that were once considered moderate. In this series of 51 cases, larger doses of digitalis did not alter the outcome among those with sinus tachycardia and only made those with a normal rate more susceptible to a toxic reaction. For the action of digitalis is primarily on the myocardium and not on the cardiac pacemaker.

#### SUMMARY

1 The action of digitalis on 51 patients with arteriosclerotic (coronary) heart failure with normal rhythm was studied.

2 The patients were divided into two groups: those with a normal rate (31 or 61 per cent) and those with sinus tachycardia (20 or 39 per cent).

3 Digitalis was most effective on those with isolated failure of the left ventricle and a normal rate and least effective on those with combined ventricular failure and sinus tachycardia.

4 The action of digitalis is primarily on the myocardium and not on the cardiac rate as noted by the mortality of 6.4 per cent in those with a normal rate and 60.0 per cent in those with sinus tachycardia.

5 The use of increased amounts of the newer digitalis U S P XI only brought on early toxic reactions and had no effect on the mortality.

## TIC DOULOUREUX OF THE NERVUS INTERMEDIUS

(SO-CALLED IDIOPATHIC GENICULATE  
NEURALGIA)

LEONARD T. FURLOW, M.D.

Lieutenant Commander U S Navy

ST. LOUIS

As a result of his observations of herpes, plus reports of sensory change and pain accompanying the peripheral type of facial palsy, Hunt<sup>1</sup> first described what he called geniculate neuralgia. He drew a close parallel between the sensory and motor systems of the fifth and seventh cranial nerves and described a "geniculate zone" affected by pain or herpes, stating that in this condition the primary disorder was in the geniculate ganglion. He described this so-called "geniculate zone" as lying within a cone shaped area represented by the tympanic membrane, the walls of the auditory canal, the external meatus, the concha, the tragus, the antitragus and the antihelix. He said, however, that the ninth and tenth cranial nerves were also represented in this area.

In 1909 Clark and Taylor<sup>2</sup> reported a case of tic douloureux of the sensory filaments of the facial nerve. A woman aged 28 had for two years had severe paroxysmal pains just in front of the left ear. After approximately eight months the stabbing pain in front of the ear continued and in addition, a steady pain developed which was "deep in the ear and on the anterior wall of the external meatus." Because of the pain the patient was taking 12 grains (0.8 Gm) of morphine daily. A diagnosis of tic douloureux of the geniculate system of the facial nerve was made and on April 23, 1909, Taylor reflected a small osteoplastic flap so as to expose the lateral lobe of the cerebellum. The dura was opened, the region of the cerebellopontine angle was exposed and section of the facial nerve, the nervus intermedius and the upper fasciculus of the eighth nerve was done. The dura was closed tightly and the bone flap was replaced. The patient was relieved of her pain immediately but had a complete peripheral type of facial paralysis, this facial paralysis later cleared up. She was observed for a period as long as six years after operation and there was no recurrence of her pain. According to the report, all sensory examinations of the face and ear proved negative three days after operation. The former area of pain seemed to be "a little less sensitive."

Until 1933 this case was alone and undisputed in the literature. In that year, however, Reichert<sup>3</sup> reported a case in which there was similar pain. According to him there were paroxysms of "sharp, stabbing pain deep in the external auditory canal causing the patient to shriek out and grab her ear." There were also "itching of the upper anterior wall of the meatus aches and pains of the left side of the face, nose, eyeball and parieto-occipital area and sensitiveness in the mastoid and

pretragal regions” Since her symptoms were almost identical with the original case described by Clark and Taylor,<sup>2</sup> Reichert felt that this was a case of geniculate neuralgia, so under local anesthesia the cerebellopontine angle was exposed and the seventh and eighth nerves were touched. Pain in the auditory canal was produced

Fig 1—Exposure of the cerebellopontine angle, method of separation of nerves and section of nervus intermedius. Inset shows cutaneous incision and area of bone removal.

but it was not the tic pain. Touching the ninth nerve, however, did produce the characteristic tic-like pain, so this nerve was sectioned and the pain was completely relieved. No anesthesia of the ear or auditory canal could be demonstrated after operation, but there was the usual anesthesia of the pharynx that follows section of the glossopharyngeal nerve, which has been so well described by Dandy<sup>4</sup> and confirmed by other observers. From this one case Reichert concluded that the case previously reported by Clark and Taylor<sup>2</sup> “was diagnosed as a tic douloureux of the sensory filaments of the seventh nerve but was probably cured by the decompressive feature of the cerebellar operation rather than by section of the seventh nerve.” He also concluded that there were two types of glossopharyngeal neuralgia—“the common or complete tic douloureux of the glossopharyngeus is characterized by paroxysm of lancinating pain starting in the tonsillar fossa or base of the tongue, generally radiating deeply in the ear, accompanied by salivation and induced by swallowing, talking or other movements of the throat or tongue. The partial or Jacobson’s plexus tic douloureux of the glossopharyngeus is characterized by paroxysms of lancinating pain in and about the external auditory canal and is not induced by any movements of the pharynx or tongue and is not accompanied by salivation. This neuralgia has heretofore been considered as a geniculate ganglion neuralgia. Intracranial division of the glossopharyngeal nerve has cured both types of these neuralgias.” In attributing the cure in Clark and Taylor’s<sup>2</sup> case to the decompressive features of the cerebellar operation, Reichert evidently overlooked the fact that in his description of the procedure Taylor states specifically that the bone flap was replaced and the dura was resutured completely. This of course, would obviate any possibility of the operation serving as a cerebellar decompression.

Hunt<sup>5</sup> in 1937 reviewed the whole subject of geniculate neuralgia and admitted the validity of the statement

that pain in glossopharyngeal neuralgia may be referred only to the ear, but he asserted that more frequently the pain of glossopharyngeal neuralgia, which begins in the ear, is later referred to some other portion of the area affected by the distribution of the glossopharyngeal nerve. He agrees that Reichert’s conclusion in the case reported by him personally was justified, for the patient’s pain was entirely relieved and the tic-like pain was reproduced on manipulation of the ninth cranial nerve. He denies, however, that Reichert’s contentions in the case reported by Clark and Taylor were valid because he personally had seen the patient six years after the original operation, and at that time there had been no recurrence of pain. With Hunt’s last statement I would agree, and the following case report will bear out this contention, for here again a patient with severe tic-like pain referred to the ear has been freed of that pain by section of the nervus intermedius.

REPORT OF CASE

Miss E. M. was referred by Dr. Perry Duncan of Taylorville, Ill., on May 24, 1940. She complained of pain, shooting in character and always starting in the left ear. She had never had any infections in the ear but in November 1939 she had what she thought was an earache. In the beginning the pain was chiefly of a “lightning variety” in the ear, recurring at frequent intervals but with periods of several days without pain. She had been treated by several otologists without relief. Roentgenograms of her sinuses and of her mastoids were negative and no one had been able to find in the nose and throat any cause for the pain. On one occasion cocainization of the sphenopalatine ganglion apparently caused the pain to disappear for a short time, but repetition of this treatment did not influence the pain at subsequent dates. She stated specifically that the pain was not constant but would come and go spasmodically. She always described it as being deep in the ear, and at no time did she have pain in her throat, and the pain was never produced by swallowing. Occasionally she complained of headache, chiefly on the left side, and at infrequent intervals there would be some radiation of pain into the region around the left eye, but there was never any particular radiation of pain down the neck, and she never had the feeling of soreness deep in the tissues of her face, which has been previously described by other authors.

Neurologic examination at the time she was seen originally showed no abnormality of any importance. Her pupils were

Fig 2—Hearing on the two sides approximately equal and attributable to the operation. (Audiogram made on the tenth postoperative day.)

regular and equal and reacted promptly to light. The reflexes were normal. The innervation of the face was equal on both sides, and hearing was equal in the two ears. There was no disturbance of sensation on either side of the face, the first branch of the trigeminal nerve was normally innervated and touching the posterior part of the face did not in any way produce the pain. The reflexes were present and equal. There were no pathologic reflexes. When she opened her mouth wide there seemed to be some relaxation of the temporomandibular joint, so she was referred to

4 Dandy, W. C. Glossopharyngeal Neuralgia (Tic Douloureux), Arch Surg 15: 198 (Aug) 1927.  
5 Hunt, J. R. Geniculate Neuralgia (Neuralgia of the Nervus Facialis), Arch Neurol & Psychiat 37: 253 (Feb) 1937.

James B. Costen<sup>6</sup> to see whether he felt that a pathologic condition of the temporomandibular joint might be responsible for the pain. For a number of months she was treated by Dr. Costen and by her dentist for relaxation of the temporomandibular joint, but without any relief. In October 1940 she reported at the request of Dr. Costen to say that she was no better. She was positive at that time that there was no

geniculate neuralgia was to operate under local anesthesia and have her complete cooperation. It was also explained that it might be necessary to sacrifice a part of the eighth and the motor root of the seventh nerve in order to relieve the pain, and to all of this she willingly agreed.

On Nov. 21, 1941, under local anesthesia, the usual unilateral cerebellar exposure was made on the left side. The bone over the left cerebellar hemisphere was removed, exposure of the lateral sinus being made above, going almost to the foramen magnum medially and extending as far laterally as the mastoid would permit. As soon as the removal of bone was sufficient, a small nick was made in the dura near the median line and the cisterna magna punctured to reduce the pressure. A small horseshoe shaped dural flap was reflected with the base toward the mastoid, and the left cerebellar hemisphere was gently retracted toward the midline after its surface had been protected with hot cotton. A retractor was then slipped in and the cerebellopontine angle was exposed.

The ninth nerve was tested first. When this nerve was touched the patient complained of severe pain in her throat with some radiation to the ear, but she said that it was not the typical tic pain. This procedure was repeated four times, and on three occasions she had pain only in the throat with no radiation to the ear, she was positive that it was not at all similar to the pain which she usually had. The bundle of nerves entering the internal auditory meatus was then touched. Immediately she complained of a severe pain in her ear which was identical in all respects to the pain that she had had previously. The eighth nerve was then picked up with a blunt hook, its cephalic half being touched first. Immediately the patient complained of extreme dizziness and said that the table was turning round. She became nauseated, so the nerve was released. A second attempt was made, and this time the caudal

Fig. 3—Face at rest showing no asymmetry

relationship between the pain in the ear and swallowing. She reasserted that the pain was a definite spasmodic pain which would come and go quickly and was practically always felt only deep in the ear. She did occasionally have some shooting pain in back of the ear, but she felt that this was merely a secondary radiation of the pain in the ear. Talking, eating, swallowing—nothing that she would do seemed to influence the pain and on many occasions it waked her from sleep. At that time she was put on large doses of vitamin B and was told to report back in two weeks. She reported back to the office at irregular intervals, always complaining of the same type of pain, and on Nov. 14, 1941 she was admitted to Barnes Hospital.

At this time her neurologic examination was still entirely negative. The blood Kahn reaction was negative, as were all laboratory tests. Roentgenograms of her skull showed no pathologic condition.

While the ears were being examined it was discovered that there was, on the left side, a very small area on the upper posterior quadrant of the external canal just lateral to the drum which when touched would reproduce the typical tic-like pain of which the patient complained. A small bit of wax was adherent at this spot and when this was removed very slight bleeding was produced. Cocainization of this bleeding area entirely relieved the pain as long as the effects of the cocaine were present, and during this time touching this spot did not reproduce the pain. As soon as the effects of the cocaine had subsided however the tic-like pain could be produced at will by stimulation of this small area of skin. Since the patient was entirely incapacitated by this pain surgery was decided on and she was told that the only certain method of differentiating between glossopharyngeal neuralgia and

Fig. 4—When patient is smiling the facial innervation is practically equal. The photographs reproduced here and in figure 3 were made on the tenth postoperative day.

half of the nerve was picked up causing the patient to complain of roaring in her ear, but there was no associated dizziness or nausea. In order to expose the nervus intermedius I had planned to split the eighth nerve in the direction of its fibers, as suggested by McKenzie<sup>7</sup> but I found that I was able to

6 Costen, J. B. A Syndrome of Ear and Sinus Symptoms Dependent upon Disturbed Function of the Temporomandibular Joint. *Ann. Otol. Rhin. & Laryng.* 43: 1 (March) 1934.

7 McKenzie, K. G. Intracranial Division of the Vestibular Portion of the Auditory Nerve for Meniere's Disease. *Canad. Med. Ass. J.* 34: 369 (April) 1936.

separate the seventh and eighth nerves by gently elevating the eighth nerve on a blunt hook, and by careful dissection I was able to separate the nervus intermedius from the facial nerve proper anteriorly and the eighth nerve posteriorly. When the nervus intermedius was touched the patient complained bitterly of the pain in her ear. After the motor root of the facial and the eight nerves had been carefully separated, the nervus intermedius was picked up with a blunt hook and was sectioned with a scalpel (fig 1). When this was done she cried out with pain, but the pain subsided immediately. The anesthetist was then instructed to touch the patient's external auditory canal with a cotton swab, running it in as far as the drum. The patient did not complain of any pain whatever. The cerebellum was then allowed to sink back into its normal position, the dural flap was completely resutured and the usual closure of the muscles, galea and skin with interrupted sutures of silk was carried out. At the end of the operation the patient had absolutely no evidence of weakness of the facial muscles on the left side and, so far as we could tell, her hearing was intact. Except for some intermittent vomiting for the first forty-eight hours, her postoperative course was entirely satisfactory.

Immediately after operation there was coarse nystagmus when she looked to the left. This persisted for about four days and then cleared up. There was at no time any sign of lacrimal deficiency.

On Nov 24, 1941 tests for taste sensation revealed the following. Over the anterior two thirds of the tongue on the left side taste for salt, bitter and sweet was absent. Over

The patient was discharged on the twelfth postoperative day. She was walking without any difficulty, the wound was well healed and there had been no recurrence of the pain. Innervation of the face was excellent (figs 3 and 4). The only evidence of facial weakness was a slight decrease in blinking which appeared on the eighth postoperative day.

December 17 the patient reported for a check-up. She was entirely free of the pain in her ear. There was not the slightest evidence of weakness of the muscles of the left side of the face, and sensory examination of the face, ear or superficial portion of the external auditory canal revealed no sensory loss. Careful sensory examination of the deeper portion of the auditory canal and the tympanic membrane on the left side by Dr J B Costen revealed a definite diminution in sensation to pinprick and to heat but no anesthesia. The former trigger area was not anesthetic, but touching it did not produce pain.

Tests of salivary secretion were repeated by Dr White. From the right or normal submaxillary and sublingual glands 0.115 Gm of saliva was produced in five minutes, while from the left side only 0.045 Gm was produced. From the right or normal parotid 0.48 Gm was collected and from the left 0.4 Gm (shown in the accompanying table).

Tests of lacrimal function were repeated by the department of ophthalmology with the same results as before, namely no diminution in tear secretion on the left side. Both lacrimal glands secreted at a rate higher than normal, but this was approximately equal on the two sides.

COMMENT

Objections will be raised to such an early report of this case, for obviously one cannot be sure but that a recurrence may take place. In my opinion, however, an early report is justified for in the first place this case together with the case of Clark and Taylor,<sup>8</sup> proves that "tic douloureux" of the nervus intermedius exists and may be cured by section of that nerve. Moreover, for the first time section of the nervus intermedius has been done without injury to the facial nerve or to the acoustic nerve. The final decision as to the nerve responsible for tic-like pain in the ear must be made by stimulation of the glossopharyngeal nerve and the nervus intermedius at operation. This, of course, makes it necessary that no anesthesia except local be used, for the cooperation of the patient is essential.

Second, an unusual opportunity is presented for study of the various functions of the nervus intermedius. The commonly accepted teachings are well summarized by Bing and Haymaker<sup>9</sup> as follows:

1. Fibers which stimulate tear secretion. In this case, no disturbance in lacrimation has been noted, so further studies are necessary.

2. Fibers which stimulate salivary secretion going to the submaxillary and sublingual glands. This function is borne out remarkably in this case, but further studies of the parotid and possible recovery of function by the submaxillary and sublingual glands are in progress.

3. Fibers transmitting taste from the anterior two thirds of the tongue. This function, also, is adequately proved.

The problem of the sensory field of the nervus intermedius is not definitely worked out in this case nor was it in the case of Clark and Taylor. Certainly there is no gross anesthesia of any part of the external ear nor, so far as I can determine, of the superficial portion of the external auditory canal. That the tympanic membrane and adjacent parts of the deep canal are sensitive on the sectioned side seems definite, but here again observations over a prolonged period are necessary and will be made.

all the rest of the tongue it was quickly and accurately perceived. Sensation to touch, pain and temperature was everywhere normal.

Repeated sensory examinations by many observers failed to show any sensory deficit over the face, mouth, pharynx, tongue or any part of the external ear. Testing sensation in the auditory canal is a difficult task, but even at the site of the former trigger zone sensation was present but the pain was no longer produced by stimulation of this area.

November 29 examination by the otolaryngologists failed to show any definite sensory loss, though the drum on the left was much less sensitive than on the right. The sensitivity of the left drum was believed to be much less than in a normal person.

Audiometer tests on Dec 2 1941 showed the hearing to be equal on the two sides (fig 2). There was a loss of about 10 decibels in all tones of the conversational range and of about 20 decibels for the higher tones, but this was present in both ears, so there was no loss attributable to the operation.

Tests of salivary function were made by Dr D White of the dental department on Dec 3 1941 with the method described by Reichert and Poth.<sup>8</sup> The amount of saliva from the right and left sublingual and submaxillary glands was collected for a period of five minutes. From the right or normal side 0.805 Gm was produced. From the left side only 0.185 Gm was collected (shown in the accompanying table).

On December 3 the department of ophthalmology carried out the Schirmer test for lacrimal secretion. In the right eye the measurement was 17 and in the left eye 16, so there was no appreciable decrease. Clinically a tendency to dryness of the left eye was not noted at any time.

# SUMMARY

1 Tic douloureux of the nervus intermedius is a definite clinical entity but one rarely observed

2 Tic-like pain deep in the ear may be due to disorders of either the nervus intermedius or the glossopharyngeal nerve and the decision as to the nerve involved can be made only at operation This necessitates the use of local anesthesia so that stimulation of the nerves may be done

3 The nervus intermedius may be sectioned without injuring the main trunks of the seventh or eighth nerve

4 Accepted teachings as to salivary and taste functions of the nervus intermedius are borne out in this case

5 Teachings as to lacrimal function are not substantiated, and further studies are necessary

6 The sensory field is evidently very small, for in this case only hypesthesia of the tympanic membrane and adjacent portions of the external auditory canal has been produced

## Clinical Notes, Suggestions and New Instruments

### SALMONELLA DISPESTIFER INFECTION OF URINARY TRACT

W CAREY HENDERSON MD MASSACHUSETTS

J L T, a white man aged 49 was admitted to the Northampton-Acomack Memorial Hospital for treatment of an infection of the urinary tract He had been a patient in the same hospital two years previously, at which time he had a resection of the anus and the sigmoid colon for a constricting lesion During his first admission he had had numerous catheterizations and for a time carried an indwelling catheter He had excellent control of the colostomy

During the summer of 1941 he had mild urinary symptoms, such as slight burning occasional fever and fatigue He was active, however, and did not consider the symptoms of sufficient severity for him to go to bed for treatment Trial of various urinary antiseptics forcing of fluids and changes in reaction of the urine had little effect on the amount of pus and blood present This would vary from 30 to 100 pus cells per high power field of centrifuged urine The number of red cells present varied from 0 to 10

He was admitted to the hospital Dec 3, 1941 The general appearance was excellent The weight was a little greater than that at the time of operation two years before General examination showed him to be normal except for the colostomy, which functioned perfectly Catheterization showed no stricture, but there was a 2 ounce (60 cc) residue of urine, which contained many pus cells, free and in clumps, many bacteria and a few red cells The white cell count of the blood was 10 500 with 76 per cent polymorphonuclear leukocytes Remaining blood determinations gave entirely normal results Roentgenograms did not show stones in the urinary tract Culture of the urine showed *Salmonella dysenteriae*, whose identity was proved by the agglutination test

Treatment was given with sulfadiazine, 1 Gm every four hours for two doses, then 0.5 Gm every four hours for five days and 0.5 Gm every six hours for three days The fluid intake was moderately increased

On the third day of treatment the number of pus cells in the urine was reduced to 8 per high power field, and on the eighth day there was neither pus nor blood in the urine The patient was then discharged without medication He was seen three weeks later entirely free from symptoms and from pus in the urine

The source of the infection was not known The patient was a farmer and raised chickens but did not raise hogs

### A METHOD FOR THE SIMULTANEOUS ASPIRATION OF THE CONTENTS OF THE STOMACH AND THE FIRST PART OF THE DUODENUM

J EDWARD BERK MD MSc (Med) MARTIN E REHEFS MD AND J EARL THOMAS MD PHILADELPHIA

The difficulty of maintaining a tube in situ in the duodenal bulb can be appreciated only by those who have insisted on fluoroscopic control in every instance The irritability of this part of the duodenum is such that after varying intervals the tip of an ordinary tube is displaced either forward or backward None of the methods hitherto used to study the contents of the duodenal bulb<sup>1</sup> overcome this difficulty and still permit a free flow of stomach contents into the duodenum Furthermore, it is sometimes desirable to be able to make simultaneous extractions from the stomach and duodenal bulb in order that the contents of these contiguous parts may be compared We have been able to find records of only one investigation<sup>2</sup> utilizing a procedure which made this possible The observations reported, however, were incomplete in that they were limited for the most part to single specimens withdrawn one hour after the ingestion of the test meal

The method to be described was devised to supply a more satisfactory means of studying simultaneously the contents of

Fig 1—Relative positions and distances between tip markers and perforations of gastroduodenal tube

the stomach and of the duodenal bulb The arrangement adopted largely meets the objections raised to previous procedures It permits not only the successful intubation of the first part of the duodenum but also keeping the tube in place throughout the period of observation following a test meal

#### METHOD

A soft rubber, double lumen tube was constructed<sup>3</sup> with separate gastric and duodenal components modified from the type

Dr Berk is Ros V Patterson Fellow in Gastroenterology From the Departments of Medicine and Physiology of the Jefferson Medical College of Philadelphia

This is a portion of the thesis submitted by Dr Berk to the Faculty of the Graduate School of Medicine of the University of Pennsylvania in partial fulfillment of the requirement for the Degree of Doctor of Medical Science for graduate work in internal medicine

3 Made by the Davol Rubber Company Providence R I The cost of the tube was defrayed by a grant from the Golden Shovel Square Club

of tube used by Diamond and others in the study of pancreatic secretion<sup>4</sup>. A small, solid, stainless steel, nonperforated, bullet-shaped tip measuring 1.2 by 0.6 cm was inserted into the free end of the single channel duodenal portion of the tube. Nine and five-tenths cm (3¾ inches) proximal to the tip the duodenal limb was perforated over an area 25 cm in length. Six and five-tenths cm (2½ inches) oral to the most proximal duodenal

perforation the gastric limb was similarly perforated over an area 25 cm in length. Radiopaque bands of stainless steel were placed immediately above and below both lengths of perforations. The relative positions of the tip, markers and perforations are shown in diagram form in figure 1.

The subject following a twelve hour fast was seated and the tube introduced through the mouth. When approximately 45 cm of the tube had been swallowed the subject was placed before a vertical fluoroscope and the tube swallowed further until the metal tip was seen to point headward after sliding along the greater curvature of the stomach. In a few cases manipulation in this position so that

the greater curvature and the tube were carried upward by the examiner's left hand at the same time that a stroking movement of the stomach toward the pylorus was applied with the examiner's right hand succeeded in getting the tube to enter

additional 20 cm of tube slowly swallowed during a period of twenty to thirty minutes, after the manner usually employed in duodenal intubation. At the end of this time the position of the tube was again determined fluoroscopically. In a few instances it was found to have coiled on itself in the stomach and, therefore, had to be withdrawn and reswallowed. Including the instances of reswallowing, more than 95 per cent of the efforts to intubate the duodenum were successful.

The duodenal openings were assumed to be within the first part of the duodenum when the distal duodenal marker, as observed fluoroscopically, was about 0.5 cm below the apex of

Fig 2—Apparatus used, showing the method of simultaneous collection of samples from the stomach and the first part of the duodenum.

Fig 4—Normal duodenum. A, film taken at time of gastroduodenal analysis showing position of tube. B, film taken after injection of barium sulfate through the duodenal portion of the tube. Note outline of duodenal cap, in which duodenal markers may be seen.

the bend in the duodenal tube (fig 3B, fig 4A). When the tube was in this position the subject was returned to the table and placed again on the right side.

The tubes leading from the gastric and duodenal components were connected through separate Erlenmeyer flasks with a water suction bottle placed at such a height as to maintain a constant suction of 110 mm of mercury. A picture of the apparatus employed is shown in figure 2.

The position of the tube was checked fluoroscopically at frequent intervals.

Any change in its position was corrected at these times.

At the completion of the experiment the subject walked to the x-ray department (a walk of about 20 yards plus an elevator ride of six floors). Here the position of the tube was again ascertained fluoroscopically with the subject erect. In a small number of instances it had either regurgitated into the stomach or had moved farther into the duodenum. In the majority of instances, however, it was found unchanged in its position; it had occurred throughout the test period.

A roentgenogram was taken to show the position of the tube during the test (fig 3B, fig 4A). Barium sulfate was then injected through the duodenal portion of the tube and an attempt made to outline the

of the duodenal cap. A roentgenogram was then taken (fig 3C, fig 4B). A roentgenologist (Dr Melvin A. Dillman) examined all the films, comparing them with the film taken in the erect position in the previous gastrointestinal roentgen study (fig 3A) and localizing the duodenal markers with respect to the base of the duodenal

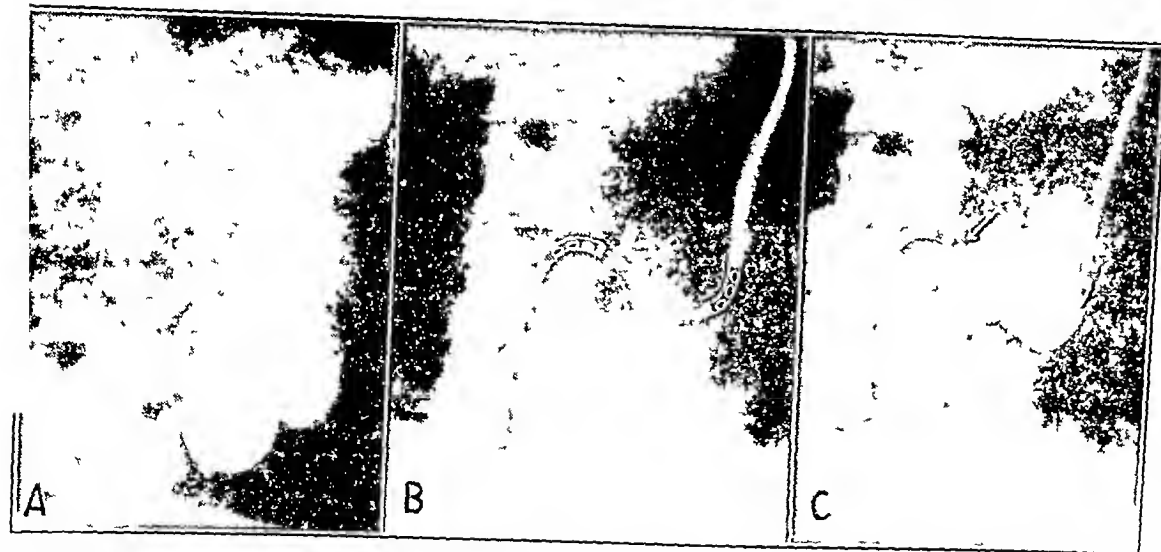

Fig 3—Duodenal ulcer. A, film taken in erect position at the time of barium sulfate meal study showing deformed duodenal cap with pseudodiverticulum formation. B, film taken at time of gastroduodenal analysis showing position of tube. Note position of tip markers and perforations. C, film taken after injection of barium sulfate through the duodenal portion of the tube. Arrow indicates relationship of proximal duodenal marker to base of cap.

the duodenum. In most instances the subject was next placed on the right side on a table adjacent to the fluoroscope and an

<sup>4</sup> Ågren, Gunnar and Lagerlöf, Henrik. The Pancreatic Secretion in Man After Intravenous Administration of Secretin. *Acta med* [Footnote 4 continued on next page]

cap. In this way proof was obtained as to whether or not the duodenal openings were actually within the first part of the duodenum.

## COMMENT

The success of this method depends on the fact that anchorage of the tube is secured by having the small solid tip pass well into the second portion of the duodenum, where, in most persons, it remains steadfast. It is by no means uncommon, however, for the tip to move on even though the tube is fixed at the mouth. Occasionally the tip and the tube may be regurgitated into the stomach, particularly if the subject should become nauseated. For these reasons, repeated fluoroscopic observations are essential.

We were obliged to utilize a vertical fluoroscope, but the use of a horizontal fluoroscope on which the subject could be placed and remain undisturbed throughout the entire test period would be desirable.

ELECTROMYOGRAMS IN DIAGNOSIS AND  
PROGNOSIS OF TETANUS

ARTHUR L. WATKINS, M.D., BOSTON

In the absence of trauma the diagnosis of tetanus is easily overlooked, and even in the presence of an infected wound and obvious lockjaw the bacteriologic studies may be negative. Tetanus toxin is known to act on the skeletal muscle, causing contracture as a characteristic manifestation.<sup>1</sup> In local tetanus produced experimentally the action potentials of affected muscles have been shown to present constant activity with diphasic spikes.<sup>2</sup> This abnormal electrical activity is a specific effect induced by tetanus toxin and when demonstrated should be of diagnostic value. Consequently, in a case of suspected tetanus of obscure origin, electromyograms were taken from the affected muscles and a test devised to quantitate the abnormality present for the purpose of prognosis and to aid in following the course of progress.

## REPORT OF CASE

**History.**—A man aged 21 entered the Massachusetts Eye and Ear Infirmary Jan. 28, 1941, because of a discharging ear of two years' duration, with an acute exacerbation for two weeks. Diagnoses were made of mastoiditis, cholesteatoma and Bezold's abscess and a radical mastoidectomy was done the following day, with removal of the cholesteatoma and pus. No bacteriologic studies were done at this time. On the fifth postoperative day the patient complained of a stiff neck on the right side and some difficulty in opening the jaws which persisted in spite of local heat and massage. Roentgen examination of the cervical spine and temporomandibular joints was negative as were the determinations of blood levels for phosphorus, phosphatase chloride and carbon dioxide combining power. He was thought to have a muscular strain of the trapezius muscle and possible arthritis of the temporomandibular joints and was referred to the physical therapy department for treatment. There the diagnosis of tetanus was suspected, as he had trismus, contracture of the right trapezius muscle, hyperactive tendon reflexes and rigidity of the spinal muscles. Electromyograms were taken which confirmed the diagnosis and treatment was started on the advice of a surgical consultant. A total of 100,000 units of tetanus antitoxin was given parenterally within six hours. During the next three weeks there was gradual improvement.

of the trismus and torticollis which was quantitatively shown by the electromyograms. He was then discharged with a clean mastoid wound. Two cultures taken from the draining wound before antitetanic treatment was started were negative for *Clostridium tetani*. Two months later he returned for plastic closure and clinically showed no evidence of tetanus at this time. Electromyographic studies also were negative.

**Electromyographic Tests.**—Electromyographic tracings<sup>3</sup> were obtained from the right trapezius and both masseter muscles with an ink-writing three-channel Grass electroencephalomyographic machine with bipolar surface electrodes. After maximum relaxation was secured recordings showed continuous electrical activity from all leads (A in the tracing), in contrast to normal muscle at rest, which shows no action potentials (C). To test for the presence of generalized tetanus, the effect of an external stimulus on the degree of spasm was determined by blowing a whistle near the patient. This

Electromyograms in tetanus. A, A1 and A2 tracings before treatment. A, continuous electrical activity in affected muscle with maximum relaxation. A1, decided increase in voltage after whistle is blown near patient. A2, slight increase in voltage persisting four minutes later. B, sixteen days later moderate discharge at rest only slightly increased by whistle. C, three months later no electrical activity at rest or after whistle as in any normal muscle at rest or after whistle. Time intervals and calibrations are the same in all tracings. R, M indicates right masseter; L, M left masseter and T, right trapezius.

definitely increased the voltage of the action potentials, although no change was observed clinically (A1). This increased activity persisted for four and a half minutes before the activity returned to the previous level (A2). The test was repeated sixteen days later at which time the trismus and torticollis had diminished. At this time the whistle produced no increase in the electrical activity but at rest there was persistent spontaneous discharge presumably due to persistent local tetanus (B). Two months later the electromyograms were normal at rest and were uninfluenced by the whistle (C). Voluntary movements produced the normal burst of diphasic spikes.

Dr. Robert S. Schwab, director of the Brain Wave Laboratory, cooperated in obtaining the electromyograms.

## COMMENT

The appearance of tetanus after an otherwise uncomplicated mastoidectomy is of interest because of its rare occurrence.<sup>4</sup> Tetanus was not suspected and consequently the diagnosis was not made for more than a week. Bacteriologic studies were not helpful, the only specific evidence of tetanus toxin being the presence of muscle contracture and the abnormal electromyograms. An increase of electrical activity following the whistle suggests that the central nervous system was affected as well as the muscles locally, indicating a more serious prognosis. The voltage of this abnormal electrical activity and the response to an external stimulus gave an objective quantitative index of the extent of local and general action of the toxin and a sensitive guide as to progress. The diagnosis of tetanus in the average case can readily be made on clinical grounds alone, but the electromyograms may prove of value in an obscure case, as in this instance. Although action potentials have been recorded from experimental tetanus, we have not found a previous report of the electromyograms from a patient with this disease.

## Council on Physical Therapy

THE COUNCIL ON PHYSICAL THERAPY HAS AUTHORIZED PUBLICATION  
OF THE FOLLOWING ARTICLE

HOWARD A. CARTER, Secretary

### THE RESPONSIBILITY OF MEDICAL SCHOOLS TO TEACH PHYSICAL THERAPY

EBEN CAREY, M.D.

Dean, Marquette University School of Medicine  
MILWAUKEE

The administrators of medical schools have a tremendous responsibility during these times of World War II. They now face an accelerated program to shorten the medical course from four to three years and demands for hours allocated for certain additional courses. These problems are presented in the face of an overcrowded medical curriculum which includes the present four years of educating medical students. We are faced both with a reevaluation and a reemphasis on basic essentials of teaching methods and of the content of the medical courses. During this period of stress it is not my desire to propose an additional burden but to point out the great need that our graduates have, who were yesterday our students, for practical instruction in the indications and contraindications of physical therapeutic methods.

Notwithstanding the venerable age of physical therapy and its many worthy uses, it gradually fell into disrepute, and at the time of our entry into World War I practically no instruction in this subject was given in any of the medical schools. One reason for this was its wide exploitation by quacks and charlatans, which caused conservative physicians to look on it with distrust. Others, overenthusiastic, made unwarranted and exaggerated statements as to its value, which further alienated members of the medical profession.

During World War I in 1917 and 1918 the urgent need of returning the wounded rapidly to the front lines or of rehabilitating them sufficiently for noncombatant duty brought about what might be termed the rebirth of physical therapy. The Surgeon General defi-

nitely amalgamated all the methods of physical therapy when he defined it as "physical measures such as are employed under physical therapy, including hydrotherapy, electrotherapy, mechanotherapy, active exercise, indoor and outdoor games, and passive exercise in the form of massage." Physical therapy thus became a definite entity with well defined branches.

For the vast work of convalescence and reconstruction it was necessary to secure trained personnel. Medical personnel, commissioned and enlisted, was hastily trained, all available physicians who had had experience in any of these branches being utilized. Reconstruction aides in physical therapy were appointed. These were not all nurses but were a group of young women who were well trained in their occupation and who, by their splendid work, insured the success of the newborn specialty. They either were graduates of normal schools of physical education or were college graduates who had majored in physical education, in addition, before being accepted in the Army they were given six weeks' intensive training in physical therapy.

Physical therapy as part of the practice of medicine has made considerable advance during the last twenty years. Systemic instruction in undergraduate and postgraduate schools, critical research in adequately equipped institutions and authoritative information issued periodically by the Council on Physical Therapy are gradually replacing objectionable propagandizing methods employed by commercial concerns. Yet in many parts of the country the profession as a whole does not evaluate properly the possibilities and limitations of physical measures. As a result there occur many errors of commission, such as the overenthusiastic and unwarranted uses of physical therapy procedures, and also errors of omission, for example, the exploitation of valuable measures by irregulars and lay persons instead of by qualified physicians.

Leading manufacturers in conference with physical therapy committees have subscribed to the principle that instruction in diagnosis and therapeutics belongs solely to the province of the medical profession. The only instruction that an ethical manufacturer can consistently offer to the profession is on the manipulation and care of some certain type of apparatus.

The maintenance of acceptable standards in compensation work may also receive attention. In some of the larger centers low grade industrial clinics and unscrupulous physicians have attempted to turn the wholesale use of physical measures into mere sources of revenue. The medical profession must be informed that in traumatic and other cases physical measures are to be employed only (1) after a complete diagnosis has been established, (2) when the existing pathologic or functional changes serve as an indication for physical therapy and (3) when physical therapy is applied efficiently on the basis of a definite prescription and continued no longer than it is really indicated. On the basis of these principles, cooperation with insurance carriers may be established and opportunities for good work by qualified and ethical physicians developed.

Well informed members of the medical profession have come to realize that physical therapy measures belong to the therapeutic armamentarium of the educated physician. That their efficiency, when applied in suitable cases with the proper technique, has been definitely established. It behooves leaders of medical states and counties to safeguard the interests of patients.

<sup>4</sup> Bishop, J. M., Du Bose, R. H., and Hamlin, F. E. Orogenous Tetanus, J. A. M. A. 98: 1546-1548 (April 30) 1932.

health and of the medical profession by encouraging or actively promoting educational work which will lead to a more widespread and more rational use of physical therapy by the medical profession in general

There is a growing consciousness on the part of the medical profession regarding this great value of physical therapy. This new outlook has been aided by the activities of the Council on Physical Therapy of the American Medical Association and its publications of conservative articles on this subject. These articles have been collected and published in the Handbook of Physical Therapy, the third edition of which appeared in 1939.

The Council on Medical Education and Hospitals of the American Medical Association has cooperated with the Council on Physical Therapy to advance the teaching of physical therapy to medical students. It is the duty of every medical school to teach the principles and application of medicine, surgery and physical therapy so that the medical profession may use all these measures to the best advantage. The foundation of this instruction is the proper teaching of the medical student.

Motion pictures may be obtained, free of charge on application to the Bureau on Exhibits of the American Medical Association, but because they are in great demand requests should be made for their use at least two months in advance. These pictures illustrate

The value of physical therapy in internal medicine was stressed by Piersol<sup>1</sup> as follows:

It may be stated with little fear of contradiction that there is no field of therapeutics less understood and less frequently employed by internists than physical therapy. There are several reasons that account for this unfortunate state of affairs which has its inception in our medical schools. A survey of the curriculums of undergraduate as well as graduate medical courses reveals the fact that, if taught at all, but little time is devoted to the various aspects of physical therapy and that at best the courses available to students of medicine are inadequate and superficial. The average physician therefore approaches the practice of medicine knowing little about one of the oldest and most useful branches of therapeutics. Physicians as a rule because of their lack of understanding, evince little interest in acquiring a sound working knowledge of physical therapy. Furthermore the proper application of physical therapeutic methods requires not only time but a certain amount of manual dexterity. Since physicians have been loath to give of the former or to acquire the latter, the field of physical therapy has been neglected by the medical profession.

Hubbard has said "A man is usually down on that which he is not up on."

If physical therapy is to remain under the control of physicians and advance as it should along sound scientific lines the indifference which the internists as a group have displayed in the past must give way to an active interest in developing a constructive forward looking policy to improve the practice of and extend education in physical therapy.

Mock, Coulter, Pemberton and Krusen have repeatedly stressed simple therapeutic measures for home treatment which should be as definite as for drug therapy.

Mimeographed instruction sheets may be used for this purpose, and the Council on Physical Therapy will send, on request, samples of instruction sheets that may be used. In the present emergency the National Research Council has appointed a subcommittee on physical therapy to cooperate with and to advise the Surgeon Generals of the Army and Navy, the Veterans Administration and the Public Health Service in the use of physical therapy in government hospitals.

As an example of the need of instruction in physical therapy on the part of general practitioners, I may cite the demand for instruction manifested during the last two years at the exhibit on low back pain under the direction of Dr. Frank Ober at the annual meetings of the American Medical Association. A faculty of over fifty demonstrators has exemplified the methods of physical examination of the peripheral nerves and muscles, bones and joint range of motion, as well as simple physical therapeutic procedures of heat, massage, exercise, and passive and active motion. The doctor wants this knowledge because of the demands on the part of the public for this agency of relief and the neglect on the part of medical schools to emphasize this modality of treatment to its medical students.

This neglect is manifested in the fact that the most difficult course for the medical administrative officer to organize is the one on physical therapy. Dr. Piersol states that you may comb a great metropolitan center and still find little (organized) material to give students a constructive course along this line. As a nation, faulty posture is one of our outstanding shortcomings noted in draftees. Among those nations in which mass exercise has been in vogue for many years, youths have acquired good posture and are better prepared for military services. He also emphasizes that physical therapy, including those procedures used in heart disease, are adjuncts. Physical therapeutic aids will tend to shorten convalescence and increase the well-being of patients not only physically but also psychologically.

Our duty to medical students and the medical profession will not be fulfilled until each medical school formulates a teaching program in physical therapy. We owe this duty likewise to the public, because physical therapy is part of the art of healing.

The individual patient expects his doctor to relieve pain and suffering and to be a healer of the ills of the human body. The ethical methods of diagnosis and therapy employed by the physician do not concern the patient as long as relief is given. It is probably this relief to the patient which has been lacking in certain forms of diseases that has led to the rise of cults and quacks in reference to treatment of derangements of the locomotor apparatus. More original research is needed in this field but in spite of our lack of knowledge there is still ample evidence of the relief given to man by the use of physical agents. It is the duty of every administrative officer of a curriculum to see that the medical student has an opportunity to learn what is already known in this important field of physical therapy. The present national emergency is a challenge to each of us to see that physical therapy is no longer neglected in our medical curriculum for undergraduate medical students.
